MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Sent, post-paid, upon receipt of price, by

DAVID WILLIAMS COMPANY,

—THE LONDON STANDARD, the other day, published the following "ad":

Queen's Jubilee—A lady can have a good seat in aristocratic company to view the royal procession on June 22. What offers? M., 16 Dorset road, Littlehampton.

A lady who wrote to the advertiser received this reply:

"M." presents his compliments, and begs to thank Mrs. B. for her letter of inquiry of the 5th inst. "M's" club is almost the most exclusive, and consequently one of the most aristocratic in St. James street. Members and lady guests to view jubilee procession will be first received by Sir ——, K. C. B., and Lady ——, and, after viewing procession, entertained at dejeuner, with orchestra in attendance. The club society is most aristocratic, and "M." only wishes to take a lady in place of his wife, who is too much of an invalid to attend, but cannot take less than £100 for ticket and escort, as his own expenses will be fully half that amount.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

Sent, postpaid, on receipt of price, by

J. M. & L. A. OSBORN, - - CLEVELAND, O.

—"This is a queer world," said J. E. Whiteford, of Chicago, at Chamberlain's, "and a man runs up against surprises at almost every corner. The other day I was being shaved by a good-looking mulatto man in a Washington barber shop, and on talking with him found that he was a graduate of a university. He had read Cicero, Horace, Homer and Euripides, and was well versed in the higher mathematics. I asked him if he was content after acquiring such an education to work in the business he was pursuing. He said that it was a case of necessity, and much as he preferred a more lucrative employment, there was nothing else open to him, and I went away wondering whether a so-called higher education is of much use in the way of enabling a man to earn his livelihood."—*Washington Post.*

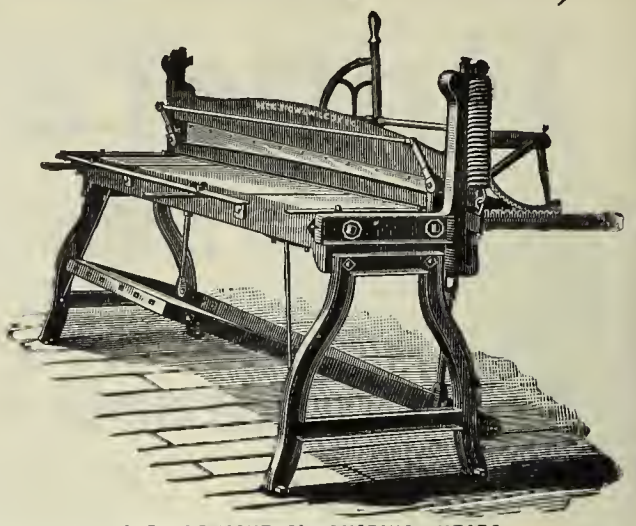
HARE'S FOUR-LEAF CORNICE BRAKE

Hundreds sold and **never a complaint.** Works easily and rapidly. The universal verdict is, **IT IS THE BEST IN THE WORLD.**

96 inches long. Price $250.

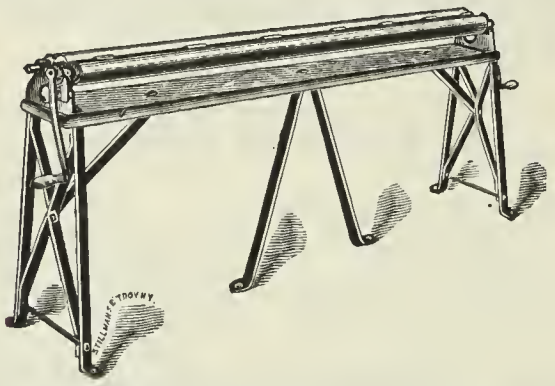
Our **Improved Eureka Cornice Brake.** Will bend No. 20 iron.

96 inches long. Price $185.



CORNICE MAKERS' SQUARING SHEARS, **With Lever Arc, Automatic Gauge.** Will cut No. 22 iron. **97 inches long. Price $275.**

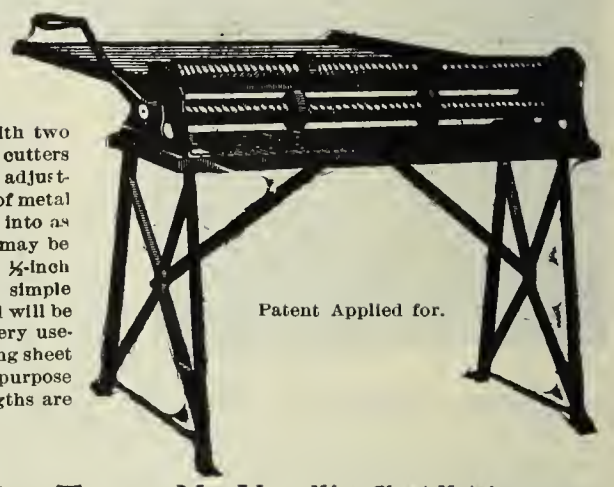
The CAPITAL GUTTER FORMER



is adapted to form gutter from 3 inches to 7 inches inclusive. The forming of the bead and gutter is practically a continuous operation. Capacity 600 feet perfectly formed gutter per hour with two ordinary men or boys.

The Rotary Slitting Shears

are provided with two or more pair of cutters which are easily adjusted to cut a sheet of metal 30 inches wide into as many strips as may be desired, from ½-inch and wider; is simple and durable, and will be found to be a very useful tool for slitting sheet metal for any purpose where long lengths are required.



Patent Applied for.

Mention THE METAL WORKER. **For further information and prices address** **WATROUS & CO., Troy, N. Y.,** **Mfgs. Sheet Metal Working Machinery.**

—LORD ROSEBERY'S WITTICISM.—During Lord Rosebery's term as Foreign Secretary, in Mr. Gladstone's last administration, he was often employed by an elderly female who paid him daily visits to get his opinion on matters of no importance to him whatever. Finally, becoming exasperated at the woman, he gave the doorkeepers orders not to admit her under any circumstances. However, not a day passed that she did not make an effort to gain a hearing, and on an unusually late visit happened to meet the Secretary just as he was about to enter his carriage.

"Lord Rosebery," said she breathlessly, "I must see you on a most important subject, and at once."

"Very well, madam," said the urbane Secretary of State, holding open the door of the vehicle for her, "I beg of you to get in."

Delighted to be invited to drive with so important a personage, the talkative lady jumped into the carriage, Rosebery gently closing the door on her, and befor she could expostulate, she heard him saying to the coachman:

"Take the lady wherever she wishes to go, James, and then go home."

Looking out of the window, the now irate occupant saw her late victim stepping into a cab.—*Harper's Round Table.*

—NO HATRACKS NEEDED THERE.—Speaking of wind, a traveler down in Osage County was astonished the other day to see a lot of farm hands walk up to the house at the dinner hour and place their hats against the wall. The wind held them in place as firmly as if they had been hung upon so many nails. —*Kansas City Journal.*

BRIDGEPORT, CONN

—THE RABBIT PROBLEM SOLVED.—The vexed question of the extermination of the Australian rabbit, which has hitherto constituted the chief problem that has confronted every antipodean administration, has at length received a satisfactory solution. There is no longer any necessity for invoking the services of great scientists such as the late Dr. Pasteur and Professor Koch to devise means for their extermination, for the invention of the cold-storage rooms on board ship has led to the bunnies being exported in a refrigerated condition to the omnivorous market of the mother country. Rabbit pie is a favorite dish in the United Kingdom, and the rabbit, which could not be successfully canned for transport and preservation, is now leaving Australia for England at such a rate that soon there will not be a single one of them left in the antipodes.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

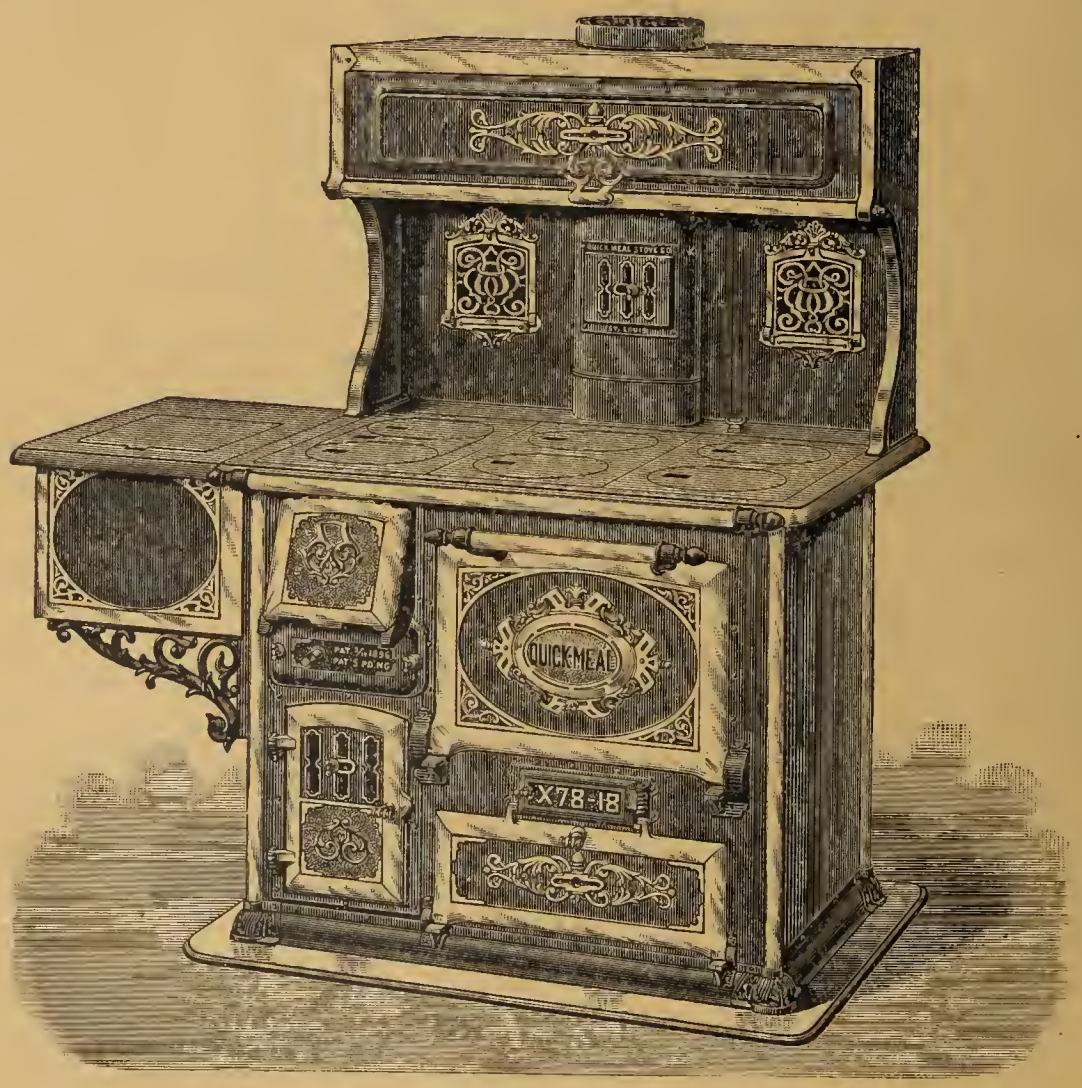
QUICK MEAL

STEEL RANGE.

Its name tells the story of its convenience.



The most essential feature for a dealer to consider in a steel range is its Selling Quality, its advantages in making sales.

This feature must include best materials, skilled workmanship, artistic design and attractive finish. No other range combines these advantages so perfectly as the Quick Meal. They are not the cheapest ranges, but they are the best.

Quick Meal Ranges are built to look well, to cook well, to bake well and to sell well. They have so many distinctive features and so many sale compelling qualities. Quick Meal Ranges sell and satisfy.

THE FORBES WARM AIR FURNACE.

PHILADELPHIA, April 10, 1897.

Messrs. TUBULAR HEATING AND VENTILATING CO., 228 Quarry Street, Philadelphia.

GENTLEMEN:—The Forbes Warm-air Furnace placed in my house last fall has given me entire satisfaction.

During the greater part of the winter the house had to be kept at a very high temperature, owing to illness in the family. Your furnace did all it was called upon to do, and on a remarkably small amount of coal.

Last winter a furnace of a popular make failed to even warm the house comfortably, and burned fully 50% more coal.

I think your furnace is all you claim for it, and do not hesitate to recommend it to any one desiring comfort and economy. Very truly,

5027 Florence Avenue. M. J. FALLS.

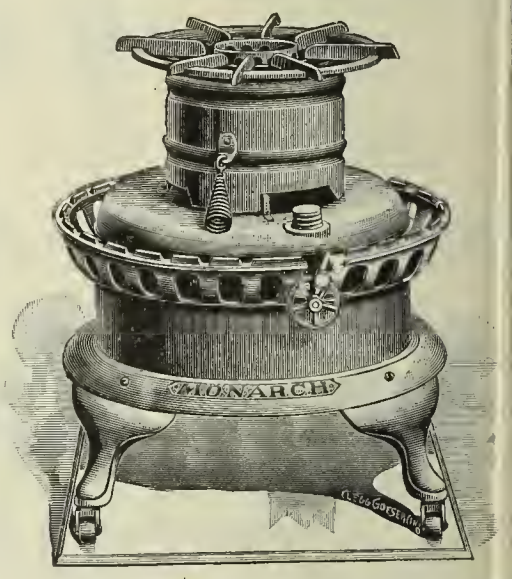
Monarch Blue Gas Flame Oil Heating Stove.



The phenomenal success of the "Blue Flame" oil burner of the past two years has created a "Macedonian Call" for a heater made on the same lines, and the "Monarch" steps foward to supply the demand. It has been on the market one year, and for the season of 1897-8 is presented with several important improvements which a year's experience has suggested and we offer it with all confidence in its efficiency, cleanliness, intense power and great comfort.

HERNDON, IA., Oct. 6th, 1897.

The Monarch Stove Co., Mansfield, Ohio.

Gentlemen:—Last year I bought an Oil Stove from you, and now want a new wick.

The Stove has given the best of satisfaction, is perfectly safe, and the best of it is, it furnishes lots of heat and no smoke or odor whatever. It is a gem and a success. We used it all last winter.

Yours respectfully,
F. C. JONES, M. D.

Clermont Oaks

are made from the best materials that money can buy. All workmen employed on Clermont Oaks are skilled mechanics. The patented jointless ash pit is molded in one solid jointless piece, making it absolutely air tight. The large pipe collars are molded integrally with the main top. The patent screw draft register supplies any amount of air required. The hot blast smoke combustion register is also of screw type. Ball bearing grates make a direct saving in wear and tear. Corrugated cast iron bowls allow for expansion and contraction. V-shaped joints prevent the bowl from buckling. There are no short measurements in Clermont Oaks. Patent anti-buckling rings prevent drum from buckling. Drums riveted direct upon the fire pot. Radiating surface reflects directly upon the floor.

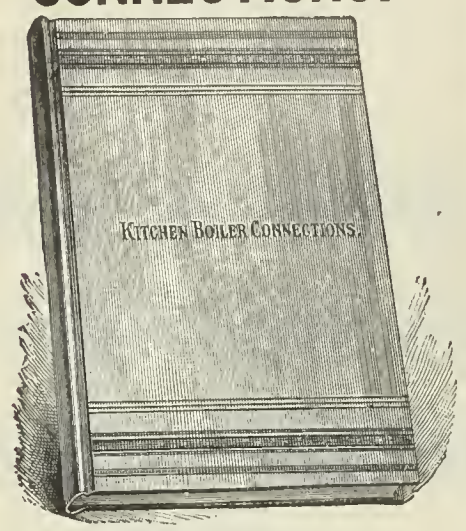
KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

CROWN FURNACE without Casing,
showing steel drum, heavy sectional fire-pot, dust flue, sand joints and **auxillary flues** for long-distance heating.

"THE KIND THAT HEATS."

THE Crown WARM AIR Furnace

For Long Distance Heating by means of AUXILIARY FLUES.

MADE IN FIVE SIZES.

In the installment of almost every Warm Air Furnace, rooms are found more difficult to heat than others—due either to their remote location or to their unusual exposure. By the use of our **Auxiliary Flues,** a positive circulation of heat is obtained in said rooms. One or more of these flues may be attached to each of the following sizes Crown Furnace: Nos. 1138, 1142 and 1148. By the use of this attachment, we have solved the problem of long-distance heating by means of hot air—a matter of great importance to all users of Warm Air Furnaces.

The Junior Crown Furnace

THE KIND THAT HEATS.

DESIGNED FOR MEETING THE COMPETITION ON LOWER PRICE FURNACES.

Strong Points:

Especially adapted for all grades of anthracite coal.

The best "pea-coal furnace" ever made.

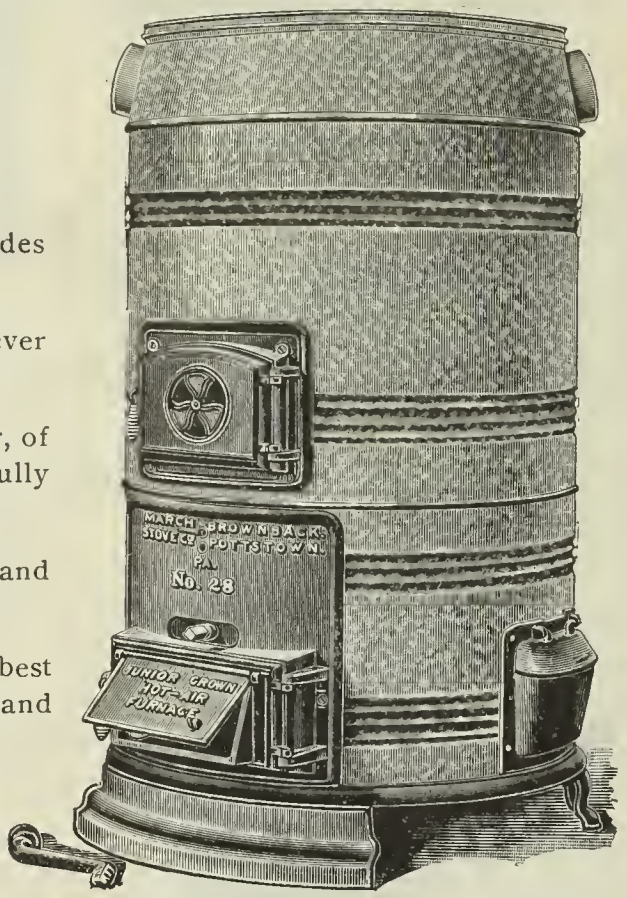
It is a quick, powerful heater, of good weight, and carefully made.

We guarantee its operation and warrant its durability.

The radiators are of the best steel, with cast-iron top and bottom.

The joints are cup-joints, easily packed and perfectly gas tight.

MADE IN FOUR SIZES.



Cut showing Furnace mounted with low top. Adapted for use in low cellars.

Special Features:

NEW IDEAS,
ADVANCED PRINCIPLES.

Eclipse Duplex Grate.

The best grate for round fire-pots — simple, effective, perfect. The best pea-coal grate and the strongest duplex grate ever invented.

The Corrugated Fire-Pot.

(It is all in the rib.)

This is the most effective way of applying the Hot-Blast System of draft.

The Hot-Blast System.

Application of the latest scientific principles of combustion. The greatest thing ever invented.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

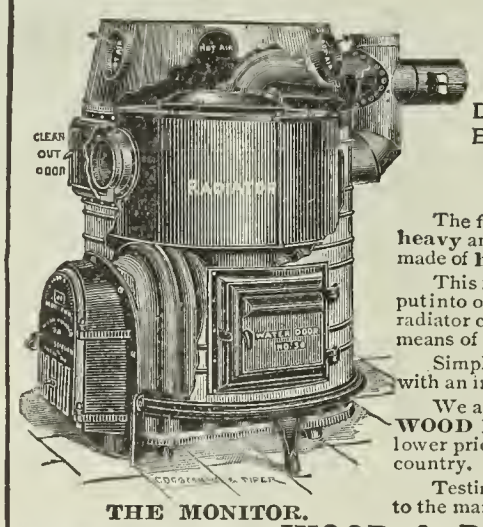
WOOD FURNACES



THE MONITOR.

ESTABLISHED 1839. INCORPORATED 1894.

OUR IMPROVED MONITOR.

With DIRECT and INDIRECT DRAFT, is made in two sizes for Brick or Galvanized Cases.

No. 38 burns 3 ft. wood, No. 50 burns 4 ft. wood.

The fire-box is made of cast iron, **corrugated** very **heavy** and **substantial.** The dome and radiator are made of **heavy plate** iron (gas tight).

This furnace can be set in low cellars and is easily put into old brick work. With smoke pipe removed, radiator can be cleaned thoroughly in five minutes, by means of clean-out door in front.

Simple to manage and most economical in fuel, with an immense heating power.

We also make the **CLIMAX and HOT BLAST WOOD FURNACES,** the best of their kinds at a lower price. Thousands in use in all sections of the country.

Testimonials and full particulars sent on application to the manufacturers.

THIS IS A SAMPLE OF MANY TESTIMONIALS:

DELTA, OHIO, May 20th, 1897.

Messrs. SCHWAB & SERCOMB, Milwaukee, Wis.

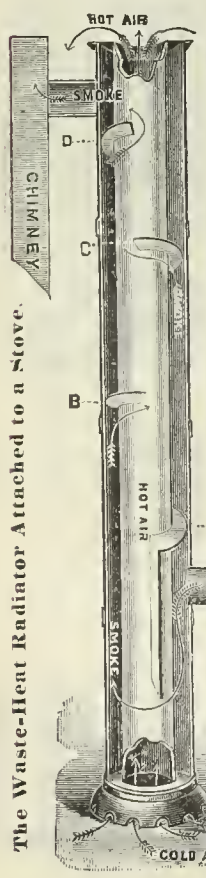
GENTLEMEN:—The combination hot air and hot water heater that you placed in my residence in the fall of 1896 is perfect in its operation and entirely satisfactory in its heating results. There are nine hot water radiators and ten hot air registers, making a perfect distribution of heat. You may refer anyone to me for the strongest endorsement of this system. Yours very truly, J. M. LONGNECKER.

We make Warm Air Furnaces adapted to any fuel or climate.

SCHWAB & SERCOMB,

E. E. DUNNING,
Manager Heating Department.

MILWAUKEE, WIS.



The Waste-Heat Radiator Attached to a Stove.

THE
WASTE-HEAT RADIATOR

saves the heat that is usually wasted up the chimney; takes the cold air off the floor and heats it; takes the hot air from the ceiling and puts it on the floor; **saves half the coal.** As the cold air is drawn in and up from the floor the hot air on the ceiling comes down to take its place, securing a continuous circulation.

Waste-Heat Radiators.

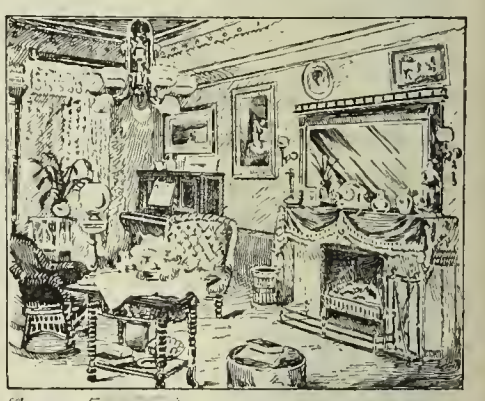
TO DEALERS IN STOVES AND FURNACES:

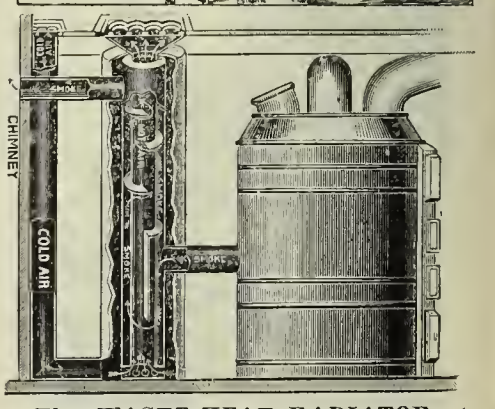
We want to send you one of our No. 5 Waste-Heat Radiators. We don't ask you to buy it, we simply ask you to put it on your stove in your store or in your house and try it, and if you find it as good as we say it is—that it saves a fourth to half the coal—then we want you to buy it, and take the sale of them in your city, but if you do not find it as we say it is, then hold it subject to our order. We **know** that they save a fourth to half the coal, and think the quickest way to get them on the market and make some money out of them is to send one to one good stove man in every city and let him try it on his own stove, and find out for himself what they will do. Awaiting your response, we remain,

Yours respectfully,

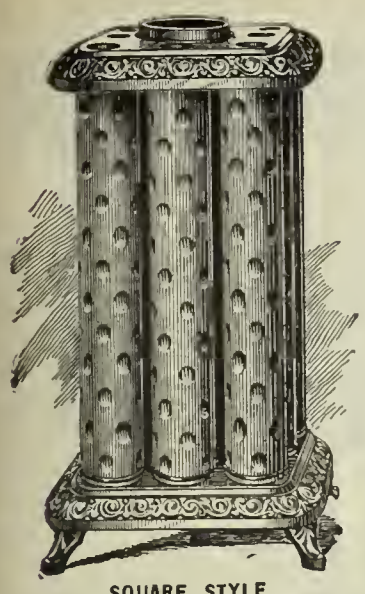
T. H. GREEN & CO.,
Duluth, Minn.

WASTE-HEAT RADIATOR CO.,
Buffalo, N. Y.





The WASTE-HEAT RADIATOR attached to a hot-air furnace; attaches to steam and hot-water boilers in the same way.



SQUARE STYLE.

DO YOU WANT TO INCREASE YOUR BUSINESS?

You can do so. There is no question about it at all. An article that will make one fire do the service of two fires finds many buyers as soon as people know about it.

New Era Radiators

do this, and there is a big profit on every one you sell. Drop us a card and we will send you a circular telling all about these Radiators and our special inducements for handling them. Do it now, so as to be ready for the opening of the season.

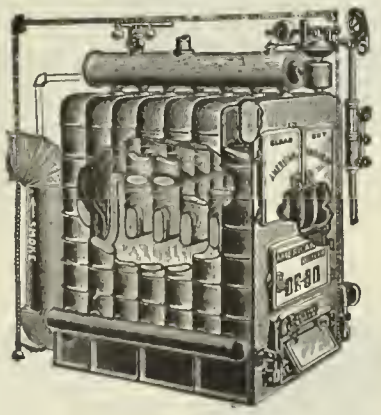
Sediment Accumulation

in heating boilers is a dangerous thing. May choke up the water passages, or cause them to burn out, or get into the valves and cripple them. Sediment does not accumulate in the



"American" Steam Boiler.

It is so constructed that all the water can be drawn from the heater when desired, so that no sediment need accumulate in the sections. *Send for "American" Book.*

sense applied to the question of furnace heating will demonstrate the fact that good hot air pipe is as much of a consideration as a good furnace, **poor piping means much waste.** If you concede this let us send you catalogue of **Furnace Pipe** constructed on scientific principles, a **money, time** and **labor** saver. Look into this matter, it will pay you.

SAFETY FURNACE PIPE CO.,

Nos. 11 and 13 E. Atwater St., Detroit, Mich.

You may miss a contract

if you are not posted in regard to the merits of the Fowler & Wolfe Improved Wall and Steam=ship Radiator.

This is the Radiator which can be made any number of sections long, and in a variety of forms. It affords 3 ft. of efficient heating surface to 1 sq. ft. of wall surface, takes up very little more room than a base board, is exceedingly handsome in appearance, and may (the surrounding surfaces as well) be dusted with a feather duster. Is it any wonder that Architects and Heating Engineers are specifying it for use in the best contracts?

Drop us a postal and we will send you our illustrated catalogue.

FOWLER & WOLFE MFG. CO.,

664 BOURSE BUILDING, PHILADELPHIA.

—AFTER JULY 4 the convicts with a good record in the Kansas State Penitentiary will wear suits of cadet gray instead of striped suits. In referring to the matter the warden of the Penitentiary says: "I believe the change will have beneficial results. When I made the announcement to the men of the proposed change they seemed highly delighted with the prospect. Since that time I have observed a difference in the demeanor of the prisoners, and the class of offences has been of a more trival character. The stripe is older than the penitentary in this country. It came across the ocean. The lockstep came with it. We associate both with the penitentiary, and in the public mind the chief mark of disgrace in going to the penitentiary is the donning of the stripes. The convicts know this and hence the opportunity to keep out of them is seized upon by all men sent to prison, especially by men who still possess hope and ambition to be something better than convicts."—*New York Tribune.*

Easy to BUY. Easy to SELL.

DETROIT FURNACE & HEATER CO.,

DETROIT, MICH.

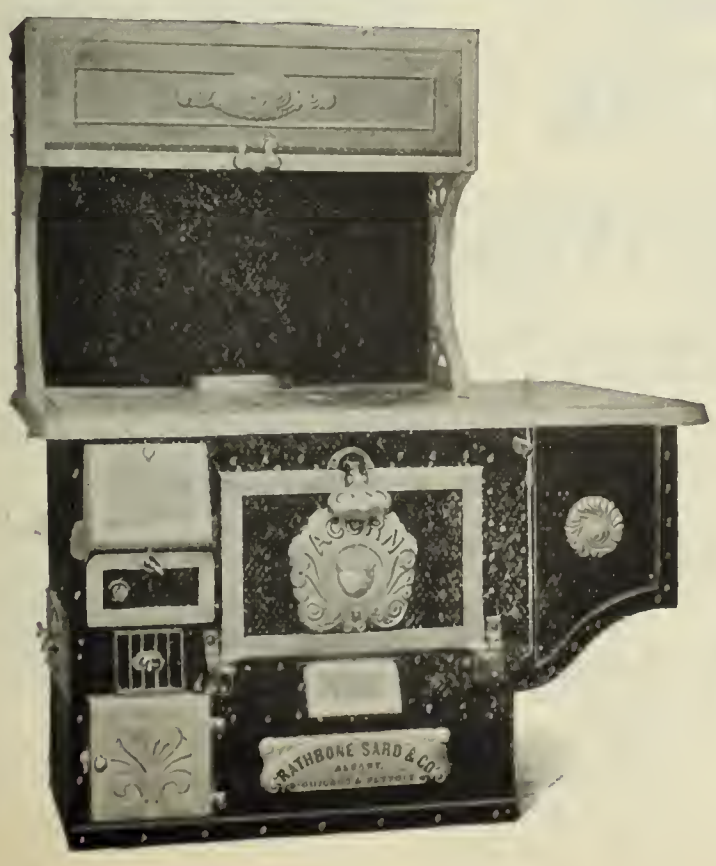
The Active Acorn.

A Specialty Without an Equal.

Thousands of these ranges have been sold since its introduction this spring. At times it has been difficult to fill orders, so great was the demand.

We claim for the Active Acorn that it is a sure and quick worker; more durable than any cheap steel range. Is easily repaired when necessary. Has a great number of selling features. Will not get broken or damaged in shipment, and is the handsomest and quickest selling range ever made.

Remember, the Active Acorn is not a steel range. It is made of heavy cast plates, with a steel oven. It resembles steel ranges in its shape only.



Prices are about the same as are charged for common sheet iron ranges, and the Active Acorn will outlast three or four of these inferior patterns.

If you don't sell it you are losing valuable trade.

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid upon receipt of price, by

DAVID WILLIAMS COMPANY,

PUBLISHERS,

232-238 William St., New York.

—MIXED IN HIS METHODS.—The absent-minded man continues to do things that add to the general merriment of the world and his own chagrin.

A case in point is that of a Boston father of a "wool-gathering turn of mind," who entered a grocery store with his baby on one arm and a kerosene can in his hand. Setting the can down on the counter he said, gently:

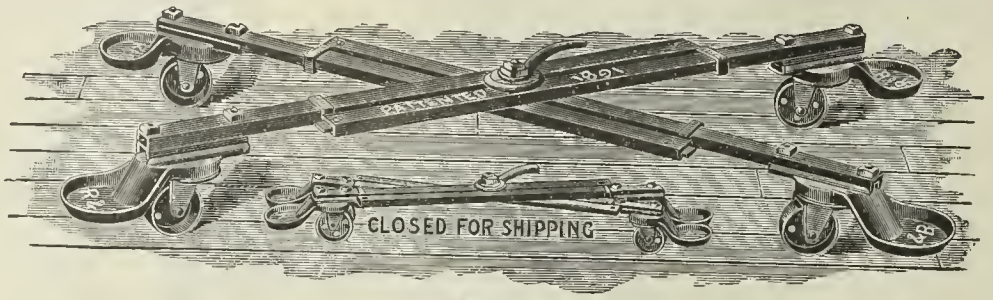
"Sit there a moment, dear;" and, holding the baby out to the dazed clerk, he said:

"A gallon of kerosene in this, please."
—*Harper's Bazar.*

READ THIS OFFER!

We will send one or more of these Stove Trucks on trial for a month and take them back if not satisfactory.

THE ONLY TRUCK THAT DOES NOT SHOW UNDER A STOVE



OR RANGE OR RAISE THEM HIGH FROM THE FLOOR.

PRICE, $16 Per Dozen.

It is literally out of sight, and consequently does not detract from the appearance of the stove or range upon it or make them look awkward or ungainly, as all other trucks do.

HANDLED BY ALL LEADING JOBBERS.

—THE strict regulations for bicyclists hitherto enforced in Austria have recently been greatly relaxed by an order of Count Kielmansegg, the official having this matter in charge. The requirements of an examination by the police of all bicycists have been dispensed with, and henceforth riders can decide for themselves whether they are sufficiently skilful to ride in the public streets or not. With this has also been abolished the annual license fee of five florins (about $2). Bicyclists also receive much greater liberty as to the streets and roads they may travel on, and the speed they may adopt is more definitely fixed. In respect to the rules of the road, bicycles are put on the same footing as light vehicles of all sorts. The Vienna Cycling Association is preparing a great demonstration in honor of Count Kielmansegg to express the thanks of the wheelmen. He is a member of one of the local clubs.—*New York Tribune.*

—In Venice not long ago a lottery drawing gave rise to the opening of coffins in order that the sign of a lucky number might be detected in the eye or on the lips of the corpse. Shrouds dusty and covered with mould were examined for traces of writting that might lead to the sought-for knowledge, and new-born infants were closely inspected for birthmarks that would reveal the secret, while it is said that ladies of birth and education wore their dresses with the insides turned out, in order to propitiate the god of the wheel. In Naples a begging monk was fallen on by two footpads, who insisted that he should tell them the lucky number, and on his assurance that he was not able to do so they beat his so severely that he afterward died in a hospital. These expedients to steal the secret of Fortune display so much ingenuity that it would seem as if their practitioners might without much trouble make more money in other ways.—*New York Tribune.*

—AN AMERICAN traveling in Jerusalem describes in "The Hartford Courant" a dinner he recently ate in Jericho. "We sat down on the porch of the hotel," he says, "after a dinner at which we were served with butter from Norway, cheese from Switzerland, marmalade from London, wine from Jerusalem diluted with water from the well of Elisha, raisins from Ramoth Gilead, oranges from Jericho (in no respect inferior to those from Jaffa or the Indian River, Florida), and almonds from the east of the Jordan, smoking Turkish tobacco, which, like the Turkish Empire, is inferior to its reputation, and a cup of coffee from—the corner grocery of Jericho."—*New York Tribune.*

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. Terms and Definitions—15 Pages,
II. Drawing Instruments and Materials—13 Pages,
III. Linear Drawing—6 Pages,
IV. Geometrical Problems—35 Pages,
V. PRINCIPLES OF PATTERN CUTTING—25 Pages,
VI. PATTERN PROBLEMS (3 Sections)—325 Pages.
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

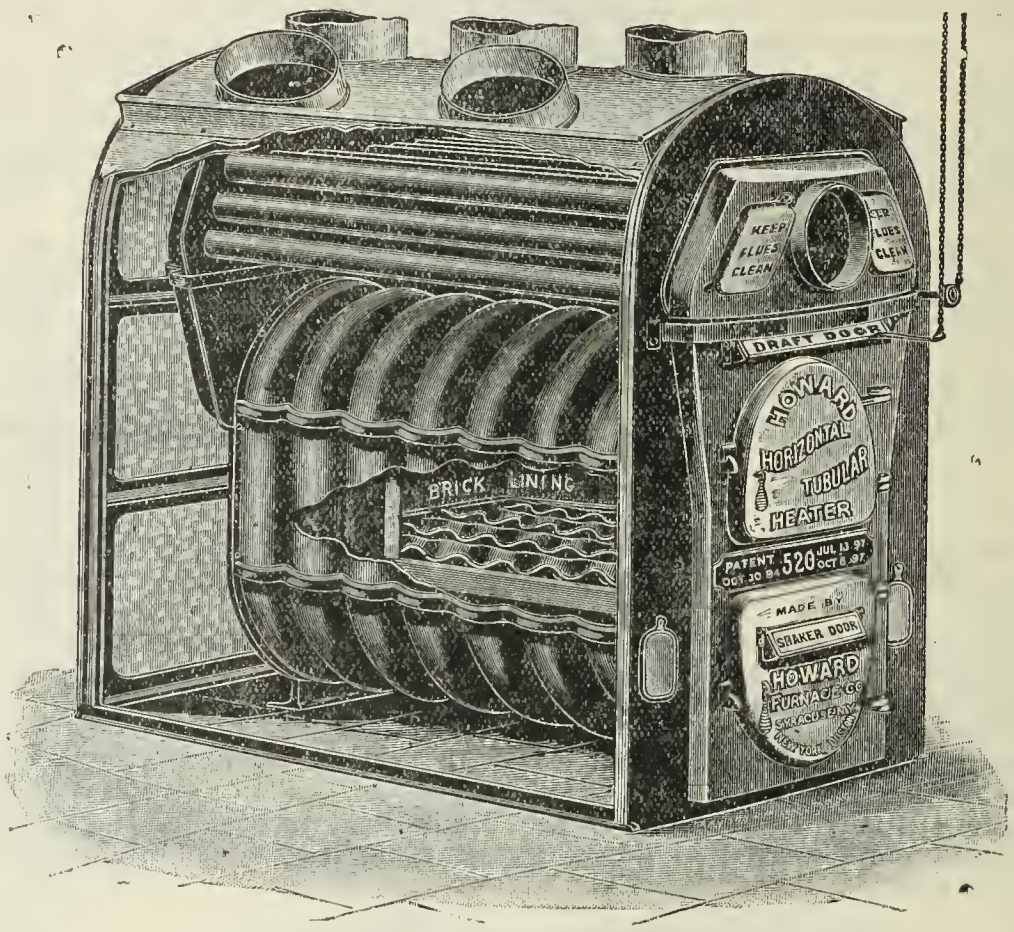
Dean Swift

Said:—"When a true genius appears in the world you may know him by this infallible sign—that all the dunces are in conspiracy against him."

it is true

Ignorance may talk as it will, but learning has its value. When anybody avoids a phenomenon, and refuses to pay it that attention which it deserves—science is protested, and truth is made a bankrupt. The mission of **science** is to study and try the depth of everything. It is never satisfied. It is everlastingly thirsting for information. It plays in progress the part of utility. Do you want examples? They abound. Here is one. Why not investigate this furnace? It is a phenomenon of concentrated heat qualifications, as the following description shows.



Patented: Oct. 30, 1894. July 13, 1897. Oct. 5, 1897.

tubular construction

in the first place splits the fire travel. That very thing retards the draft, and hinders the heat from wasting in the chimney. Not only that, these tubes occupy the entire air chamber of the heater. They pierce the air at a distance of one inch apart, so that at all times the "warmed air" is confined in close contact with the radiating surfaces. There are a dozen reasons in favor of this construction. Write us about it.

The Business Situation.

In some respects the month of October was disappointing in its business results, as compared with the previous month. Sales did not quite total up to expectations, especially in the last two weeks. The reason generally accepted for the falling off was that many merchants stocked up thoroughly in September and did not need additional supplies. That this experience was not general, however, is indicated by the trade figures of last month, which showed an aggregate of clearings 6.1 per cent. greater than in October, 1892, and 28.9 per cent. above the figures for the same month last year. When it is recalled that the general level of prices is much lower now than it was five years ago, the inference is plain that a very large amount of merchandise must be changing hands and that buying must have been going on considerably in excess of immediate requirements. The West and Northwest has been probably the most favored region in the way of business activity. Reports from that section point to very free buying of manufactured goods by the agricultural community, who have been selling their crops at a handsome profit and paying off mortgages and back debts, and who now find themselves in a position to lay out their surplus cash in many of the necessaries and comforts of life from which they have been debarred during the former years of depression. For this reason, improvement in business is much more pronounced in the West than in the East. Trade in the South has suffered severely through the yellow fever scourge and the accompanying restrictions of quarantine, but the colder weather which has set in is already exerting a favorable influence there and orders from Southern points are coming in more freely. The comparative mildness of the weather interferes with the movement of winter goods in most parts of the country. But this condition cannot long continue now, and merchants and manufacturers are looking for a stimulated demand as soon as the first really cold snap occurs. Export business continues remarkably large, and its volume in both agricultural and manufactured products steadily swells. Last week's shipments of wheat from Atlantic ports amounted to 4,000,000 bushels and the total outgo of the cereal from this coast in October was over 14,000,000 bushels, against 9,800,000 bushels last year. The price of wheat advanced 3 cents a bushel this week, but cotton reached the lowest price in two years, on indications of a much larger crop than was expected. The money market is again very easy and commercial loans have much increased. Speculation in stocks was very narrow and professional, while prices of securities showed little change on the week's dealings. The metal markets have displayed little activity, but iron and steel manufactures are in good demand with prices unchanged but generally firm.

Nine Months' Building Operations.

The improved condition of general business as compared with a year ago is found to be reflected in some measure in the extent to which building operations have been conducted during the past nine months in this city and immediate vicinity. It is to be noted, however, that this improvement is not general throughout the country, as the conditions existing in the larger cities are entirely different from those which obtain in the villages and smaller towns, and while a fair degree of building aetivity may prevail in leading centers, complete stagnation may characterize the building business elsewhere. This can be explained in large part, if not altogether, by the fact that in the important eities there is always more or less doing in the way of new office buildings, business blocks, apartment houses, dwellings, &c., to say nothing of the immense number of alterations made every year, involving in the aggregate the expenditure of a vast sum of money. The extent to which this has been done is nowhere more apparent than in New York City, where during the first nine months of the year permits were issued for 2771 buildings, estimated to cost $66,207,665. These figures compare with 2558 buildings projected in the same period of 1896, estimated to cost $61,386,775, and 3131 buildings, estimated to cost $69,663,417, in 1895, which was the banner year in the building line in the history of the metropolis.

Learning By Reading.

BY I. SIGHT.

It all depends on how you read whether you get any benefit from it or not, was what the shrewd old fellow said to the few that had congregated in the shop discussing the value of trade papers. Some of the best workmen said that they had received great benefit in their work from articles in *The Metal Worker*. Some other men, who were notorious for always being in trouble over the jobs assigned them, growled that they saw no good in reading and didn't do it. The old chap took up a recent copy of *The Metal Worker* and said he would read it for them. On the last page he saw "Going Behind" and said the crowd that was doing it needn't feel lonesome, for it was a big one, and all because they didn't reason right. "Accurate and Rapid" next struck his eye and he smiled, saying that things were rapid enough, but there was a woful lack of accuracy in the way they were done. On the next page "Drop Hammers" caught his attention, and with no regard for relevancy he remarked that if they dropped harder and oftener in all trades business would be more profitable. "What every tinner wants" in his opinion was to have all of his competitors carefully esti-

mate the cost and then add a profit when bidding on work. "About this time of year," he said, trade was pretty brisk and money came in fairly well, but trouble came from people not preparing for the later winter months and the January settlements.

"Lead Washers" he thought referred to some workmen who looked as if they bathed in liquid stove blacking. "Galvanizing Works" suggested that many shops throughout the country should be so treated to see if it wouldn't bring some life. "They are soft, clean, well coated and easy to work" reminded him of men who succeeded to an old business with no knowledge of trade. "We want your business," this statement made by a man who spent his odd time in canvassing, would be far better than growling by the shop stove. "Popular because reliable" was a desirable condition, for no competition could succeed against it.

"Conductor Pipes" should lead from the people's pockets into the bank account of every well conducted business. "Look Here" he considered a good suggestion to the buyer who could often find profit in reading the ads. "Heads and Faces" are a proper study for every salesman, for his success in business depends on his success in reading them. He then skipped the middle pages and said: "It is plain enough" that reading and thinking pay. "Keep your hand clean" of tricky methods in business could be profitably obeyed. "Don't peel the potatoes" was a hint for a man inclined to be too close in his dealing to please his customers. When "All Cast Iron" caught his eye he said that means no sand or sand holes to pay for. "Put up expressly for the retail trade" had a smack that made some of the listeners wipe their mouths with the back of their hands and then look sheepish. "Must be seen to be appreciated" is a hint that a dingy salesroom kept in disorder will hinder the sales of really good bargains. "Please the People" should be the aim of all, from the boss to the errand boy, and if you have good trade you will know "That this does it."

"Now, my young 'Apollos,'" said the old chap in closing, "if your ears have been open you have been treated to a 'Side Feed' and 'American Seal' was on the label, and you should know that it is a libel to say what you did about reading. If I ever have to read this paper to you again it will be from the middle, where you will be further benefited."

The Franklin Institute and Smoke Prevention.

At its last monthly meeting the Franklin Institute concluded its exhaustive investigation of the smoke question. This task was undertaken almost a year ago at the request of the Board of Health with the view of assisting that body in the work of formulating a practicable ordinance for presentation to city councils regarding the elimination of the smoke nuisance. Acting upon the request of the Board of Health in April last, the secretary of the Franklin Institute sent invitations to prominent engineers and scientists in various parts of the country to be present and to contribute papers on the subject of "Smoke Prevention" at the meeting to be held in May. So general was the response and so numerous were the papers that the discussion was necessarily carried over to the next monthly meeting, and more than a score of speakers and correspondents discussed the subject from a broad, scientific standpoint. At the conclusion of the second meeting the following resolutions were offered:

Whereas, The Board of Health of the City of Philadelphia has requested the Franklin Institute to investigate the question of smoke prevention, and to offer practical suggestions relative thereto; and

Whereas, The use of bituminous coal is increasing in this city, and is likely so to continue in the future; and

Whereas, It appears from testimony of scientists and experts, presented at this meeting, by invitation of this institute, that it is practicable to burn bituminous coal in stationary boilers and furnaces without creating a smoke nuisance; therefore be it

Resolved, That it is the sense of this meeting that the continuous or frequent discharge of dense black smoke from the combustion of bituminous coal is unnecessary, and should not be permitted within the city limits.

Resolved, That a copy of these resolutions be sent to the Mayor, the president of the Board of Health and to the presidents of city councils.

After discussion the resolutions were referred to the Board of Managers of the Institute for their consideration and advice. The proceedings were then published in full in the "Journal" of the Franklin Institute in the June and July issues, together with an appendix containing the smoke ordinances of the cities of Chicago, Cincinnati, Cleveland, Pittsburgh, St. Louis, Detroit, Milwaukee and Minneapolis, and the State ordinance of Ohio. The whole of this valuable information—the most complete of its kind—was reprinted in pamphlet form and widely distributed, in response to requests from other cities here and abroad. The Board of Managers, in its turn, appointed a special committee to study the resolutions. After two months' consideration these were favorably reported back to the institute, together with an additional resolution suggesting the possibility of diminishing the discharge of smoke from locomotives within city limits by more careful firing, and more especially by the substitution of anthracite or coke for use in drilling engines. The resolutions as amended by the Board of Managers were presented to the Institute at its September meeting and unanimously adopted. The Institute—whose members are for the most part manufacturers, and therefore large consumers of bituminous coal in boilers and furnaces, and consequently smoke offenders—acting in a broad spirit of progress, placed itself on record as an opponent of the smoke nuisance, and expressed its belief in the practicability of its ultimate suppression.

A creditable feature of the discussion, says the *Record*, was the absence of any allusion whatever to special devices; the subject was confined strictly to principles equally applicable everywhere. Several months after the dissemination of the information contained in the published report, in response to a very general request from all parts of the country, invitations were sent out to the makers of improved smokeless furnaces, of automatic or mechanical stokers and of all similar devices, to appear before the Institute and exhibit models or photographs and give descriptions of their appliances. This invitation was generally accepted, and it was necessary to devote two meetings this fall to this special branch of the subject. The next issue of the "Journal" will be practically given up to brief descriptions, with illustrations, of these devices and the discussions thereon.

There was one feature of great financial importance which was thought to be outside of the proper purview of the Institute, and which was, therefore, excluded, not overlooked. We refer to the serious depreciation in value of real estate in the immediate neighborhood of the tracks of the railroads entering the city, due to the great increase in the smoke nuisance in recent years. We have knowledge that mortgages have been called in on rows of comparatively modern houses solely on this account. The selling value of the properties has been sadly diminished, and difficulty of renting has been increased by the growth of the smoke nuisance. The resolutions passed by the Institute carefully differentiated the conditions existing between stationary boilers and locomotives. In the one case they declare positively against the discharge of smoke; in the other they merely suggest a practicable method of alleviation without entailing undue expense or restrictions upon the railroads. The Institute has faithfully performed its arduous work, and it is to be hoped that the lamented death of the president of the Board of Health, who inaugurated the movement, will not put a quietus upon further proceedings. It is the plain duty of councils, in the light of the information furnished by the Franklin Institute, to pass an ordinance framed in accordance with the best features of existing smoke ordinances, avoiding their mistakes.

The plant of the Vienna Enamel & Stamping Works, Porter, Ind., has been sold by W. J. Jefferson of Chicago, for $35,000, to Frank H. Ross of that city. The works will soon be started up again.

The establishment of a Department of Commerce and Industry is strongly urged in a letter sent to President McKinley by the National Business League, of which Ferdinand W. Peck of Chicago is the president. The function of the suggested new Department would be to gather information with a view to the systematic extension of commerce with the South and Central American States and other foreign countries, collecting and tabulating statistics regarding various industries and making reports and recommendations as a basis for intelligent action in the interest of such industries and their employees.

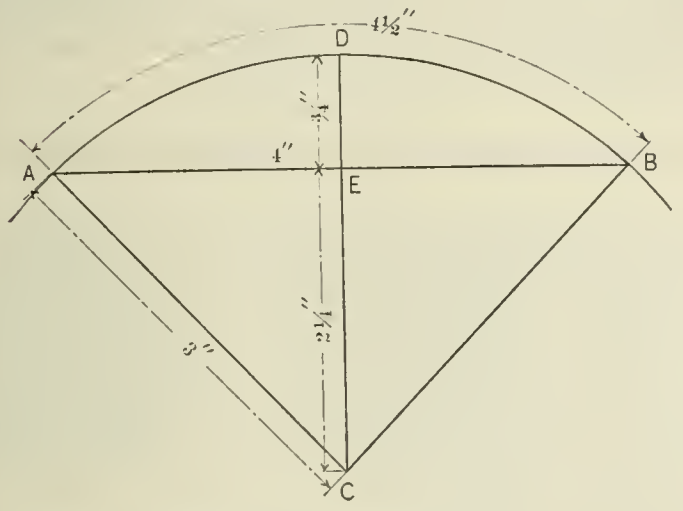
The Engineering Bureau of the United States Navy has been making some inquiries as to the possibility of procuring large merchant vessels, in an emergency, to serve as machine shops for the fleets. A list of some suitable vessels has been secured and Engineer-in-Chief George W. Melville in his annual report asks for an estimate of $25,000 for machine tools to be laid aside for fitting out one of these vessels if required.

THE LETTER BOX.

Area of a Segment.

From R. E. R., Au Sable, Mich.—Please inform me through *The Metal Worker* what the rule is for finding the area of the segment of a circle.

Answer.—To illustrate more clearly the answer to our correspondent's inquiry we have made a sketch of a part of a circle, showing a sector and segment. In the accompanying sketch our correspondent wishes to know the area of the portion A D B E. The rule given is to find, first, the area of the sector A D B C, and subtract from that the area of the triangle A B C. The area of the sector A D B C is equal to the length of the arc A D B times one-half the radius A C, while the area of the triagle A B C is equal to the length times the chord A B times one-half the distance C E. Assuming that the radius of the sector is 3 inches, the arc 4½ inches, the chord 4 inches, and the distance C E and E D 2¼ and ¾ inches respectively, we



Area of a Segment.

find the area of A D B E by the above rule to be 2¼ square inches. In engineering work the areas of segments are ordinarily determined by the use of tables. We did not refer to them, however, as we understood that our correspondent wished a rule for the purpose.

Coal Tar on Roof.

From T. H. S., Madison, Maine.—I wish to know whether or not it would be advisable to paint an iron roof with coal tar. The building is near an acid tower of a pulp mill and is rusting badly.

Note.—The question of using coal tar on metal roofs has been discussed in the columns of *The Metal Worker* at intervals for many years past. It is difficult to tell what the general opinion is, because it is so much divided. There are readers who state that coal tar is destructive to a roof, while among our correspondents during the past 10 or 15 years a number have borne testimony to the preserving quality of tar. As we said in *The Metal Worker* some time ago in answer to a correspondent, a sufficient number of layers of tar or any other water proof material will make a rain proof roof of itself and obviate the need of any other impervious coating. In 1891 a correspondent, writing on the subject of tar paint for roofs, said that he had been informed that a good paint could be made by mixing a barrel of tar with a bushel of fresh slaked lime, boiled together and applied hot to the roof. The claim made was that the lime neutralizes the acid in the tar and also prevents it from running in hot weather. In this connection it may be of interest to refer to a series of paint tests made for the Great Northern Railroad by Dr Conradson, and published in the "Journal of the Association of Engineering Societies." The following passage, which is quoted from the report, refers to conditions such as our correspondent has to cope with: "There are certain parts of steel or iron bridges, viaducts or tunnels that should have an additional (third) coat of paint. These include such places or parts of structures as are directly exposed to the steam fumes and gases from passing engines. For such a coat some cheaper asphalt paints, applied very thoroughly over the coats above recommended, would be all sufficient. Such a coat would protect the underlying primary coats for many years, preserving their natural toughness and elasticity and preventing atmospheric action on the structure." The asphalt paints referred to are made by dissolving asphalt in benzine.

Sheet Metal Supplies for the Klondike.

In *The Metal Worker* of October 23, under this heading, we printed a letter from "C. N.," Philadelphia, Pa., and gave some information upon possibilities of the trade in Seattle. We will be glad to have "C. N." send us his street address so that we may forward a letter awaiting him at this office.

Drain and Service in the Same Trench.

From W. M. M., Au Sable Chasm, N. Y.—In relaying a 2-inch water pipe which snpplies the dwelling of a customer we proposed to lay a tile sewer drain for a distance of 400 feet by the side of the iron water pipe. The two are in the same trench, although there may be a few inches between them. The objection is raised, however, that the sewer pipe should not be in close proximity to the water pipe on sanitary grounds. A great part of the time the water pipe is empty.

Note.—We hope our readers will give their opinions and describe their experiences on this subject. As a matter of sanitary precaution no sewer pipe should occupy the same trench as a water service pipe, as accidents and the ravages of time are liable to bring about conditions entirely different from what might be expected and make such an arrangement insanitary. In this instance it is stated that the service pipe will be empty for a great part of the time. Should this pipe after a long continued service become more or less porous, so as to leak, there would be a strong tendency to draw in such matter as might surround it on occasions when it is empty. The emptying process would have a tendency to create a vacuum, and if the pipe then was surrounded with the moist matter from a leaky drain the service pipe would naturally become impregnated with it. If the sewer pipe were buried at a considerable distance below the service pipe the condition would be somewhat better, but on general principles we think that all will agree that it is better to use separate trenches for the different pipes.

Iron Roof Sweats.

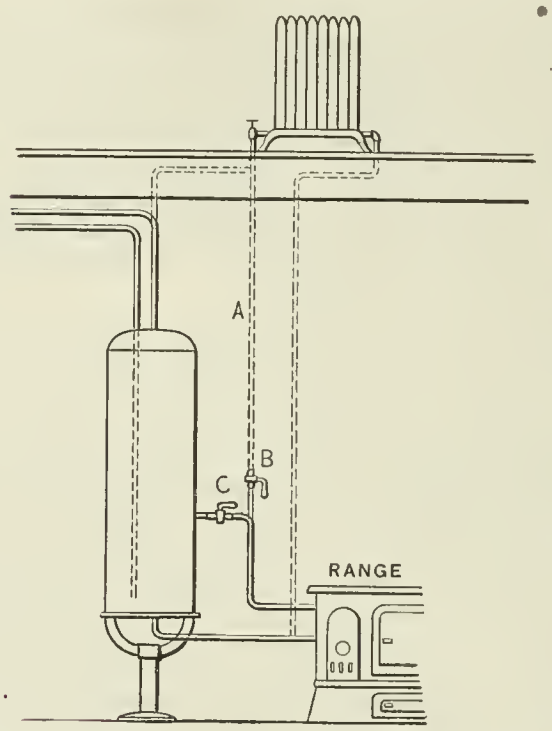
From F. B., Fremont, Neb.—I have been referred to *The Metal Worker* for information to prevent the sweating of a steel roof over a steam laundry building which is 32 x 80 feet in size. The roof is one quarter pitch, laid standing seam on sheeting like that which is used for shingling. The shingling is made of 8-inch common ship lap material, which is now seasoned so as to readily permit the warm air to pass through, and this in all probability causes the iron to sweat. I was told that an article had appeared in *The Metal Worker* during the past year

which gave a remedy for this trouble that was cheap and easily applied.

Note.—In previous issues of *The Metal Worker* it has been stated that the sweating of a roof is caused by the moisture in the atmosphere condensing on the under side of the metal, and when the quantity of condensation was sufficient it would run through any convenient opening in the ceiling. When the cause of the difficulty is so clearly known the remedy should be readily discovered. A correspondent has reported that in one instance in his experience such a difficulty was overcome by making a sufficient number of openings in the roof at different points and connecting them with small ventilators. This enabled the moist atmosphere to pass off before condensation took place. In other instances it has been necessary to finish the ceiling with lath and plaster in order to prevent the atmosphere from penetrating into the space between the ceiling and the roof. It has also been stated by some of our experienced contributors that there are some classes of buildings on which a tin or metal roof should never be put, and it can readily be seen that the moisture coming from the laundry would make some other character of roof desirable for such a building, unless every precaution is taken to prevent the moisture coming in contact with the cold surface of the metal. We shall be glad to have our readers contribute anything that has arisen in their experience which would be of benefit to this correspondent.

Heating a Radiator From a Kitchen Boiler.

From F. B., Harrison, N. J.—I should be glad to recieve a little information as to how to proceed to heat a room over a kitchen with hot water taken from a kitchen boiler, and would like to know if it can be done so as to heat satisfactorily. The room is 20 x 20 and the sketch presented herewith shows the location of the range, boiler and radiator.



Heating a Radiator from a Kitchen Boiler.

Answer.—The successful heating of the room depends on the capacity of the stove and the water back which is used for heating water. If the water in the boiler now in use gets excessively hot, so that it is sometimes noisy, it is probable that the water back has a sufficient capacity for the extra work that will be required. Without any other information as to the capacity of the room to retain heat than is expressed in its size, we would assume that 1 square foot of heating surface should be provided for every 30 cubic feet of space, and as the room is above the kitchen we assume that the ceiling is not over 8½ feet high. Consequently, the radiator to heat the room should present not less than 113 square feet of surface. It is considered ordinarily that a 1-inch pipe is hardly large enough to supply a radiator of this size, but in view of the location of the room over a warm kitchen and the short run to reach the radiator the pipe may be large enough in this case. Assuming that the kitchen boiler is not piped with much smaller than ⅝-inch pipes, we would suggest that the fitting be taken out of the top of the boiler and a 1-inch iron pipe be connected directly into it and run direct to the radiator, with a tee located at a point where the hot service pipe to the fixtures in the building can be readily connected. A valve should be placed on this pipe where it connects with the radiator. The return from the radiator should be run to the lower opening in the boiler, 1 inch in size throughout, and a tee should be placed so as to receive the pipe which brings the cold water to the water back from the boiler. If the water back does not have sufficient capacity to heat both the boiler and the radiator, the pipe A may be run from the side connection of the boiler direct to the radiator and the pipe leading from the hot service pipe at the boiler to the radiator may be left out. This pipe might, however, be retained for use when hot water was desired from the boiler and also heat in the radiator. If the pipe A is run a valve should be placed on it at B and another valve also placed at C. This would enable the circulation of water to be controlled at will. By closing the valve B the circulation would be through the boiler; by opening this valve and closing the valve C the circulation would be direct through the radiator. There should be an air valve placed on the radiator. In this instance there would be no need of an expansion tank, inasmuch as the return pipe from the boiler and the radiator permits of the expansion of the water on heating to act against the pressure of the water in the service pipe.

Sheet Aluminum Cheaper than Sheet Brass.

An interesting recent development in the metal trades is the fact that sheet aluminum is now being sold at lower prices, relatively, than sheet brass, as a comparison will show. The base price of the price-list of ordinary brass sheet is 22 cents per pound, and the maximum discount to ordinary customers is 45 per cent., making the net price for brass sheet 12.10 cents per pound. It is a fact that there is a further discount in special cases of 5 per cent., and also ½ per cent. for cash in ten days. This would mean, at the lowest rate, 5 per cent. off from the 12.10 cents, or 11.495 cents per pound ; and where a cash discount is availed of a further ½ per cent., or a rate of 11.338 cents per pound.

Now, the Pittsburgh Reduction Company have published discounts of 10 and 5 per cent. for large quantities of strip rolled aluminum sheets—that is, 10 per cent. from the 38 cents per pound—which would give 34.2 cents per pound, and 5 per cent. further would give 32.49 cents per pound. The aluminum price is therefore 32.49 cents per pound in the lowest rates in ordinary large transactions, as compared with 11.338 cents per pound for the price of brass sheet.

The specific gravity of cast brass is 8.32, and 8.549 for wrought brass ; and the factor which must be introduced to allow for the fact that the cast brass is heavier than aluminum is 3.25, and wrought brass 3.19 times heavier than the aluminum. So, by multiplying the lowest selling price for sheet brass of 11.338 cents by 3.19, one would have 36.169 cents per pound as the equivalent price for aluminum sheet ; whereas the lowest selling price, with discounts off as shown in the price-list of the Pittsburgh Reduction Company for November, 1897, is 32.49 cents per pound. From this it is evident that the selling price freely offered in the November printed price lists of the Pittsburgh Reduction Company is at least 10 per cent. cheaper for aluminum sheet than the lowest selling price for similar sheet brass by any of the Association of American Brass Manufacturers.

It is not to be understood, however, that an ordinary consumer of brass is able to obtain the maximum discounts allowed. It can be safely figured that most purchasers of brass are paying a rate of 12½ to 13 cents per pound ; and multiplying 12½ by 3.19 (the factor to allow for the greater specific gravity of brass) will give 39.875 cents per pound as the comparative selling price for aluminum ; and multiplying 13 cents by 3.19 would give 41.47 cents per pound as the comparative selling price for aluminum.

The rates given by the Pittsburgh Reduction Company according to their price-list for parties ordering considerable quantities of aluminum, at least four tons per month, to replace brass, would be therefore at least 10 per cent. cheaper for aluminum than brass, and in many cases considerably cheaper still, relatively.

SHEET METAL WORK.

SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS.—III.

BY WILLIAM NEUBECKER.

OBTAINING WATER TIGHT JOINTS BETWEEN COPPER AND TERRA COTTA.

Fig. 14 shows the method of joining metal to terra cotta in a water proof manner. A shows the terra cotta, B the brick work and C the groove which is modeled into the clay before hardening. E is the porous terra cotta blocks, and F the concrete, which is laid to the required pitch by the mason. H H H represents the copper gutter lining, with an edge, J, bent into the groove C, and then filled with molten lead, as before explained. Care should be taken when calking the lead to give light blows with the hammer, as the terra cotta is brittle and has a tendency to split.

In Fig. 15 are shown two methods of joining metal to terra cotta without the use of a groove. The first is shown at A, where C is the dovetail attached to A, and over the dovetail C the metal B is sprung. The second method is shown at A¹, where C¹ shows a beaded terra cotta drip, the metal being fastened by means of the metal B¹ clasping around the drip C¹.

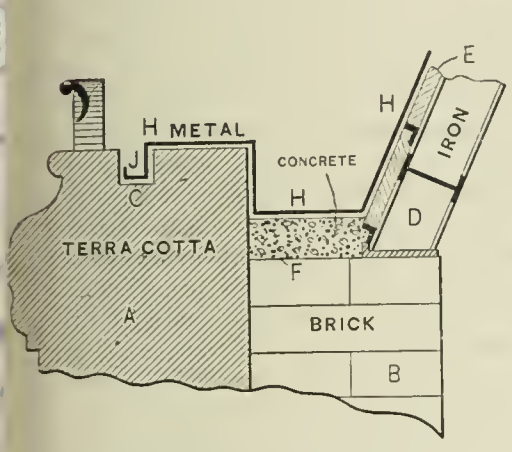


Fig. 14.—Sectional View, Showing Groove in Terra Cotta for Making Joint.

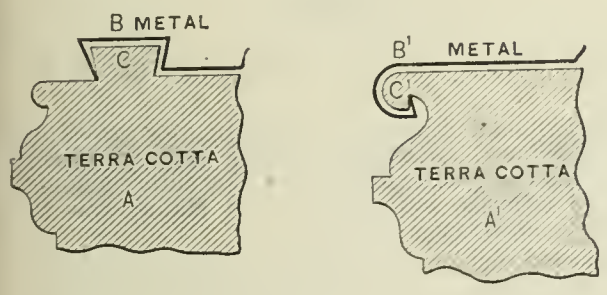

Fig. 15.—Two Other Methods of Making Joints with Terra Cotta

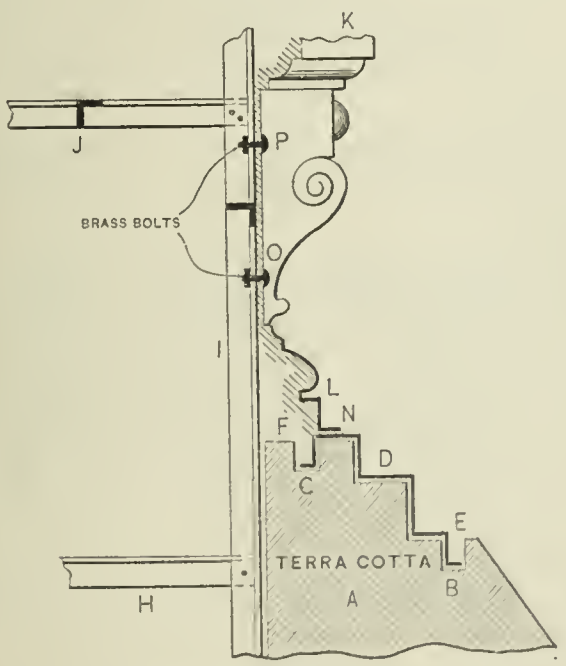

Fig. 16.—Showing Joint Between Metal and Terra Cotta in Tower or Other Work.

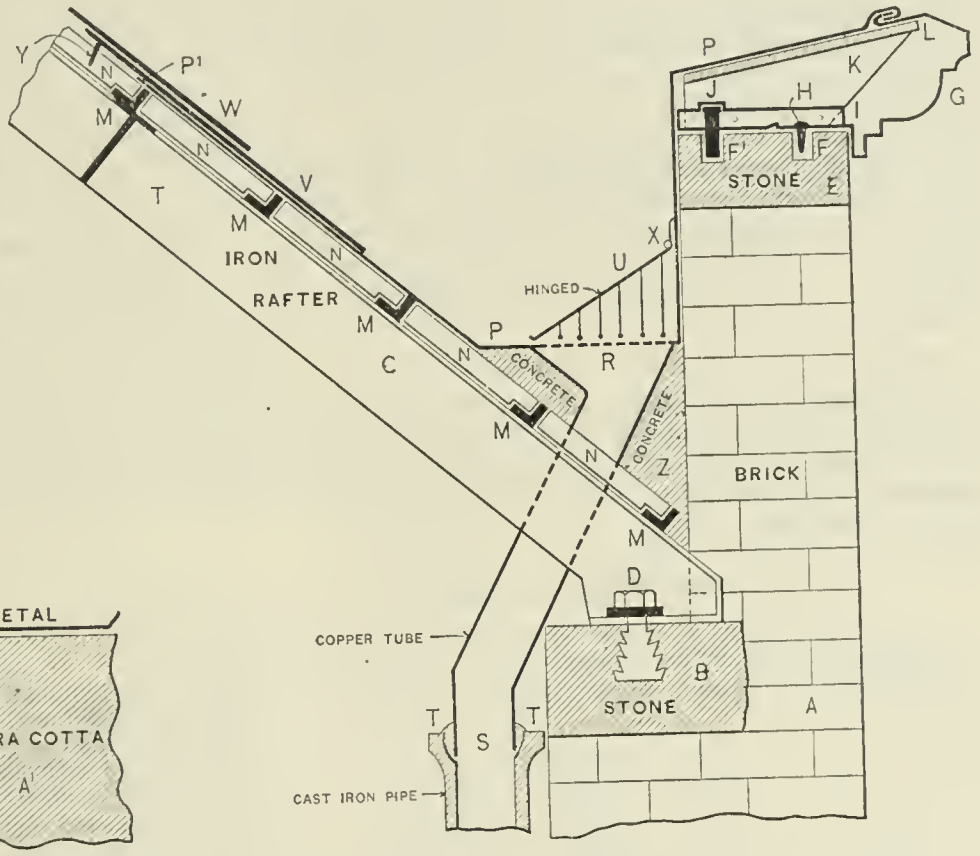

Fig. 17.—Showing Method of Setting Molding on Parapet Wall, Lining Valley and Connecting Tube Inside of Building.

SECURING BASE FLASHINGS FOR MOLDINGS.

It is sometimes the case that a metal cornice or molding is to surmount a terra cotta base, as in Fig. 16, under which a base flashing must first be flashed. This is accomplished as follows:

Assuming that the terra cotta has a profile as at A, let B and C be the grooves which have been previously modeled in the clay before hardening. The copper flashing is then formed to correspond to the profile of the terra cotta, having flanges bent outward at E and F, which are placed in the grooves and calked with molten lead. The flashing having been put on in this maner, the cornice shown by K L is then set, having an outward flange, which is soldered all around the base at N, and bolted to the iron framing H I J with brass bolts P and O at the top.

SETTING MOLDING ON PARAPET WALL, AND LINING TOP AND VALLEY WITH COPPER.

On some buildings, instead of using stone to cap the parapet walls, copper is employed, which protects the lower wall and prevents the rain from soaking through it.

Fig. 17 shows the method of doing this kind of work. E shows the section of the stone trimmings over which the molding is set, F and F¹ being the holes in the stone,

drilled every 2 feet and plugged as before described. The molding G is now set, the flange I of the molding extending far enough to allow it to be nailed into the hole F. The molding being fastened in this manner, wooden brackets K are fastened into the plugged hole F^1, after which the planking L is laid over the brackets. After the angles are filled with porous terra cotta blocks N, N, &c., by the mason the concrete Z is laid to carry the water to the various outlets, care being taken to have the mason trowel the concrete even and smooth, so that after the copper lining is laid and walked over the copper will still be even and smooth. The carpenter and mason having finished their part of the work, the lining P^1 P P is laid as shown, locking the same and soldering to the molding G at the top, and allowing the lining to extend up as high as P^1, which would prevent the drifting snow when thawing from soaking under the slates and over the lining. R is the mouth piece connected with the lining at the top, and reduced at the bottom S to allow connection to be made with the cast iron pipe on the inside of the building and calked at T T.

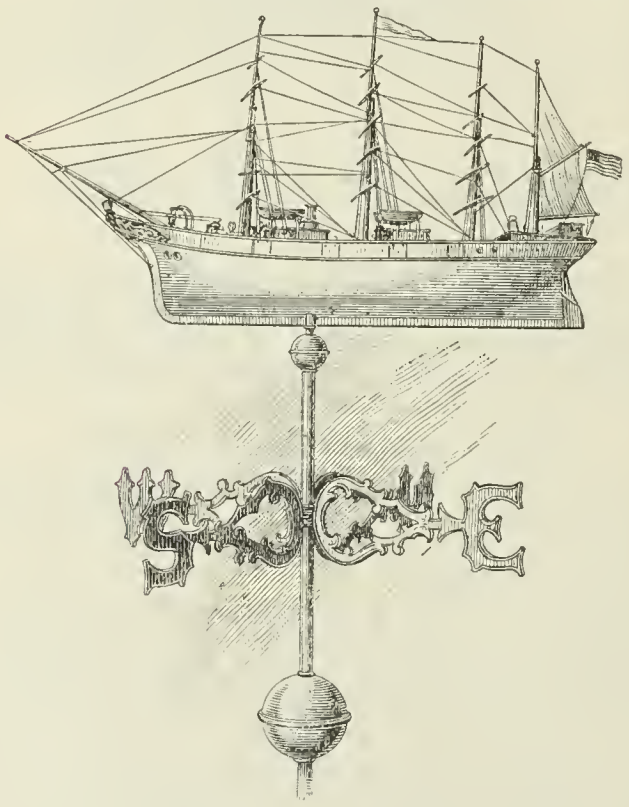
Before calking the copper tube to the iron pipe a brass ferrule should always first be soldered to the copper tube at the bottom and then inserted into the cast iron pipe. U shows a hinged strainer with the hinge at X, which allows it to be opened for cleaning purposes. V and W are the slates and Y the hard brass nails driven into the terra cotta.

FASTENING SNOW GUARDS TO POROUS TERRA COTTA.

When putting snow guards, of whatever make, upon buildings having porous terra cotta blocks it is wise to use those made of copper or brass, as the terra cotta has a tendency to absorb the moisture and would eventually rust any guard made of iron.

A Handsome Weather Vane.

The taste of a property owner is very often reflected in the weather vane which he displays on his building. In the accompanying illustration we show a vane made by



A Handsome Weather Vane.

Thomas W. Jones, 170 Front street, New York City, for Capt. J. G. Baker of the four-mast steel ship "Kenilworth," which he intends to use on his barn at West Harwich, Mass. It is a miniature of the "Kenilworth," which is a vessel 380 feet long. The vane is made entirely of copper and formed on the lines of the ship. The hull is 4 feet long and is provided with copper masts, and the rigging is also of that metal. On the prow is a figurehead representing Queen Elizabeth. The spars and the arrangement of the rigging are as near as possible that of the ship, having been arranged from the plan furnished to the riggers when the ship was rebuilt at San Francisco after having been wrecked on the California coast. Mr. Jones was called upon to furnish this vane owing to the reputation which he has already secured in the seafaring world for his eagles and gilded balls for flagstaffs. The ship is so built as to be perfectly balanced on the iron spire which supports it, and moves so easily that a very slight wind will change its position.

Western Roofing Supply Trade.

The Chicago roofing supply houses report their trade running unusually late this season. The remarkably mild and exceptionally dry weather is of course mainly responsible for this condition. New work and repairs are undertaken which in other years would have had to be deferred until spring. The scarcity of black sheets has caused some stiffening in the price of large lots of steel roofing and corrugated and stamped siding. Very low contracts placed early in the summer for material have not always proved so advantageous to buyers as they anticipated. The advance in sheets was quite marked, so much so that later business is suspected to have been too tempting to the mills and they starve their cheap customers with meager shipments, while straining every wheel to accommodate the new buyer at a better price. They can hardly be blamed for doing a moderate share of this sort of work, but it should not be carried too far. Part of the present scarcity is also to be attributed to the difficulty experienced in securing regular shipments of sheet bars from the steel works. They oversold their capacity almost without exception when trade revived, and those who handle finished products are the ultimate sufferers.

FLASHINGS.

The warehouse of the Boston Roofing Company, 116 Water street, Boston, Mass., was damaged by fire on October 27.

The Carbon Slate Company, Slatington, Pa., have just filled an order for 77 carloads of Roofing Slate for export. The order was for 4700 squares, and the entire amount, except seven carloads, which came from Maine, was the product of the Slatington quarries.

It is reported that the Caldwell & Peterson Mfg. Company, manufacturers of Sheet Metal Roofing, Wheeling, W. Va., will erect a new factory building of structural iron.

A new use for aluminum has been introduced lately by August Sohlmann, a manufacturer of Leipsic, Germany. It consists of a so called tapestry, or wall covering, formed of thin aluminum sheets, stamped with various patterns. For fastening to the wall the sheets are provided with wooden strips, or else they are backed entirely by wood, to which the tapestry is fixed by means of aluminum nails.

It is reported that the plant of the Columbia Iron & Steel Company, Uniontown, Pa., will be leased by Pittsburgh and McKeesport capitalists, for the manufacture of Sheet Iron.

The Miner & Peck Mfg. Company have taken the old Yale Iron Works Building at the corner of Chapel and Wallace streets, New Haven, Conn., where they have established their factory for manufacturing drop presses.

Articles of incorporation have been filed in the Camden County Clerk's office by the Metallic Mfg. Company, Camden, N. J. The objects of the corporation are to manufacture and sell all kinds of Metallic Cornices, &c. The capital stock of the company is $50,000, and the amount paid in is $1000. The corporators are James A. Hargan, Charles A. Damon and Edwin L. Seabrook, all of Camden.

The success of the cornice class of the New York Trade School, 1260 First avenue, New York City, is very clearly demonstrated by the fact that the applications this year have been greater than the accommodations could take care of. Altogether 32 persons applied, but only 21 could be accommodated. The management, however, we understand, intend to enlarge the space next year and put up 40 benches, drawing boards, &c. The demand for instruction in sheet metal work and pattern cutting, as we know from letters received from all over the country, is very considerable, and if the New York Trade School builds up an important department in this line their work will benefit untold numbers of young men who are ambitious to thoroughly master the cornice trade and familiarize themselves with the somewhat difficult art of pattern cutting.

HEATING AND PLUMBING.

SEWER VENTILATION.*

BY J. W. HUGHES OF MONTREAL

It has for some time been accepted as an imperative requirement of a properly planned plumbing system that provision be made for a free circulation of fresh air at all times through not only the main internal sewers of a building, but also through the smaller branches known as the waste pipe; in other words, that there be no dead ends, but that each and every part of a properly planned system of sewers for a building be constantly swept by a current of air; and carrying out this principle, provisions are made in the planning of up to date public sewer systems for the ventilation of the same The private sewers and waste pipes of a building, forming as they do but a part of the general system, should in my opinion be treated as a part of the whole; and the attempt to cut them off, as is done by fitting what is known as the intercepting trap, is a mistake: First, because it interferes with the basic principle of the water carriage system for the disposal of sewage, which is that the sewage should in the most rapid manner possible and without obstruction be carried from its source to its destination, yet the advocates of the intercepting trap place an obstruction (in other words a miniature cesspool) just at the point where it will do the greatest possible injury, and obstruct the rapid carrying away of the sewage, and defeat at the start the main principle on which the system is based—namely, the rapid removal of sewage and its carriage by an ample supply of water to its destination.

THE INTERCEPTING TRAP.

The advocates of the intercepting trap claim that the improved forms of this cesspool offer very little obstruction to the flow. Such a contention is absurd, as if they did not obstruct the flow, catch and hold the sewage they would not be traps. Again, it is claimed that the improved traps are continually washed out or scoured to a certain extent. This is true as compared with the older forms; but let any one who has had occasion to open the cleaning eye of one of these traps that has been for some time in use speak of the conditions found and he must tell of stored up putridity, sickening odors and a condition of things unsanitary, not to be found even in the main sewers of the streets, and certainly not to be found in any other portion of the pipes in a building where the sewage has had an unobstructed flow.

PREVENTS AIR CIRCULATION.

My second charge is that it completely defeats any effectual general system of sewer ventilation by preventing free circulation of air through the whole system of main sewers and that part of them consisting of the building sewers. To offset this in part what is known as the fresh air inlet is placed between the intercepting trap and the building. This is a pipe brought to the surface and fitted with a suitable terminal; the proper name of this pipe is a "stink outlet," as when a fixture is used the rush of water from it must force a portion of the air out of the inlet, and then it of necessity becomes a stink outlet, and as a rule in cities this pipe must be so placed as to make it a dangerous nuisance even to the wayfarer, or if at a distance from the foot walk to the inmates of the building with which it is connected, as the foul air escaping from it gains access to the building it is proposed to protect through doors and windows. "But," says the advocate of the intercepting trap," would you advise arranging pipes so that the air of the street sewers would have free passage through the pipes in a building?" To this my reply is "Yes" And there is no other safe plan. People who live in populous districts must bear each and every one his part of the risks as well as sharing the benefits of the whole. No one living under conditions imposed by the concentration of large masses of people on a limited area can escape, and the principle of the greatest good to the greatest number must apply.

INEFFECTIVE SEWER VENTILATION.

The advocates of the intercepting trap do not deny the necessity of sewer ventilation, but they attempt to provide for it in detail instead of as a whole, and so defeat the object they wish to attain. They will tell you that the street sewers must be ventilated by having perforated manhole covers placed at regular intervals along the line of street sewers—that is, cut off the house from the street sewers by means of a trap, but let the main sewers have free and open connection with the street. Now, as the streets of a town are the sources from which buildings derive their greatest supply of fresh air, my claim is that such a course is wrong and insanitary. Given pure air in the streets and there must be pure air in the buildings, the local cause of air pollution being, of course, excepted. Do away with the trap on the private sewers, continue the interior sewers of the building full size through the roof, carrying them to a sufficient hight to be well above adjacent windows; then there will be a natural circulation of air through the entire system of both public and private sewers, and the outlet from the sewers, which is acknowledged to be a necessity, will be above the general line of the house tops and not at the street level, as is the case when the intercepting trap is adopted. The higher temperature of the pipes passing through the building, especially in the cold season, will insure this circulation at the time when it is most required. Of course there are exceptions to all rules, and there are no doubt in all cities certain places where the local conditions would call for the placing of a trap in the private sewer; such cases call for the exercise of the skill and experience of the practical plumber and sanitary engineer. It is no more possible to lay down a rule covering every possible contingency called for in scientific plumbing and ventilating than it is to apply fixed rules to the practice of medicine. If it were there would be little need of skilled and experienced physicians. The principles of scientific medicine and plumbing are fixed, but the application of these principles calls for the intelligence acquired by education and developed practice.

CODE OF PLUMBING PRINCIPLES.

Much injury has been done by attempting to frame plumbing by-laws that will apply to every case. The conditions vary in almost every building, and to adapt the principles to the special requirements requires not only practical but scientific knowledge. If the American Public Health Association would make a study of the general principles covering this question and embody them in a code having its indorsement, leaving the practical application of these principles to those whose special duty it is to apply them, much good would result. In conclusion, conditions exist in northern climates during that portion of the year when snow is on the ground that completely neutralize the effect of the perforated manhole covers over the street sewers, and during such time, in cities where the intercepting trap is in general use, the main sewers are without ventilation and a serious condition of affairs exists, as the buildings being heated to a greater degree than the outer air have a cupping action and draw the air from the sewers into them, beneath the frozen and almost impervious top soil and paved roadways. Where the soil is porous this is sure to occur, even when the buildings are situated a considerable distance away from the main sewers.

Sewers breathe! Under certain conditions the air would rush into them; again it is being expelled, with considerable force. Atmospheric conditions partly account for this, but the varying quantities of solid and liquid matter constantly entering and leaving them have an important bearing on the question. Such being the case, proper breathing places must be provided, and any attempt to bottle up the sewer air will end in failure. What place so suitable as above the roofs of buildings, where the winds will disperse the foul gases and the light and air disinfect them?

* Read before the American Public Health Association at Philadelphia, October 28, 1897.

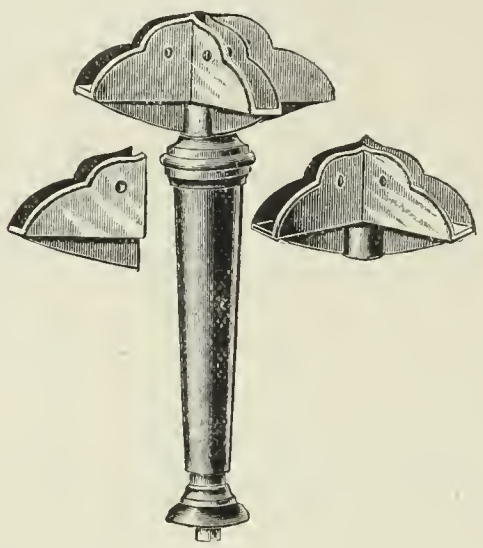
Some Sanitas Specialties.

The Sanitas Mfg. Company, 48-54 Union street, Boston, Mass., are very much pleased with the reception accorded the Sanitas Regal closet, an apparatus which was illustrated in *The Metal Worker* last August. A special feature, it will be remembered, is the metal outlet which connects the closet under water, so as to meet the requirements of Boards of Health who demand a water test below the water level in the closets. The connection is simple and the earthenware can be removed without disturbing the metal leg. These closets, which are particularly recommended for fire proof buildings, are adapted either to a floor waste or wall waste. The Sanitas Simplicity urinal is another of the specialties made by the Sanitas

Mfg. Company which is having an excellent reception from the trade. It is made on the same principle as the Sanitas closets, having a large body of water in the bowl and a retarding chamber which insures the refilling of the bowl after being flushed. The flushing is done either automatically or with a pull and chain. The Sanitas closets and urinal are two of several specialties illustrated in a circular issued by the Sanitas Mfg. Company, and which the trade will find interesting reading and valuable for reference when called upon to do first-class plumbing work. These and other circulars will be sent on application to the company.

Toilet Room Fittings.

A complete line of toilet room fittings for plumbers is manufactured by J. J. Ryan & Co., 68 to 74 West Monroe street, Chicago. They have just brought out a new line



Toilet Room Fittings.—Fig 1.—A Closet Leg.

made of a special aluminum alloy. This alloy is claimed to be the very strongest in use, polishes a beautiful silver white, requires very little cleaning and will hold its color

Fig. 2.—A Door Pull.

permanently. Although its first cost is a little higher than nickel plated polished brass, the subsequent saving of labor in cleaning more than overcomes that difference.

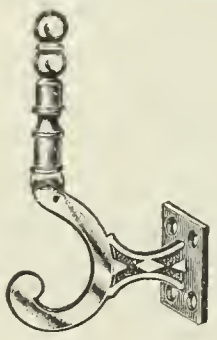


Fig. 3.—A Hat and Coat Hook.

Specimens of the hardware are herewith illustrated. Fig. 1 is a closet leg, Fig. 2 a door pull, Fig. 3 a coat and hat hook and Fig. 4 a specimen of railing.

Request for Catalogues.

E. Jackson & Son, Windsor, N. S., tinsmiths, plumbers, heaters and ventilators, having lost all catalogues in the late fire at Windsor, desire us to ask all dealers in lines which they cover to send them their respective catalogues with latest discounts, &c. The firm make a specialty of hot air heating.

The management of the recently completed Lachine Rapids plant, on the St. Lawrence, announces its intention of entering the field of domestic heating in competition with anthracite coal at $6 per ton, which is the price which obtains in that district. The comparatively high coal rate, combined with the low cost of the electric power, as developed by this water-power plant, will permit of its adoption, for cooking purposes at least, on the score of

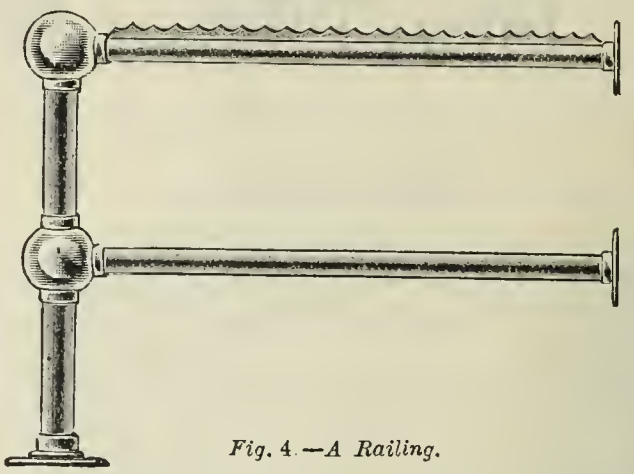

Fig. 4.—A Railing.

economy, with all its acknowledged advantages as an additional inducement. About 25,000 horse-power has been obtained in this plant at a cost of nearly $2,000,000.

Acetylene Gas Rules.

The Kentucky and Tennessee Board of Insurance Underwriters, through its executive committee, has authorized the use of acetylene gas and machines, according to the following rules :

1. No generator shall be located in any building where insurance policies cover that can generate gas under a greater pressure than that sufficient to distribute it through the pipes of the building, or under a greater pressure than that used with ordinary city gas.
2. Each generator must be properly designed and have sufficient capacity for the work it has to do, and must be made in such a manner and of such materials as to insure durability and stability.
3. Each burner burning 1 cubic foot of gas per hour shall have at least 1 pound of carbide for its supply in the generator when first loaded, to prevent too rapid generation of gas.
4. No generator shall be installed the maximum capacity of which is less than one pound of carbide for each 1-foot burner.
5. Each generator must be so constructed that when the lights are extinguished the supply of water to the carbide, or the supply of carbide to the water, will cease automatically.
6. Each generator must be provided with a connection leading outdoors, which, in the event of an accidental overproduction of gas, will convey such surplus to the outside air.
7. The room in which the generator is placed shall be well ventilated, so that any escaping gas may not be confined in said room.

Permission is hereby granted for the use of acetylene gas on the premises described in this policy, providing the apparatus for same be installed according to the rules of the Kentucky and Tennessee Board of Underwriters, and by parties duly authorized by said association for the purpose of installing apparatus for generating acetylene gas.

Permission is also granted to keep on the premises, outside the building in which this policy covers, in air tight packages, not to exceed 150 pounds of calcium carbide.

It is especially warranted by the assured: First, that no change shall be made in the arrangement of the apparatus without the written consent of this company indorsed on this policy. Second, that the genreator shall not be charged. or calcium carbide handled, except by daylight only. Third, that no artificial light shall be permitted in the room where such calcium carbide is stored ; and, fourth, that no calcium carbide, except that contained in the genreator, shall be kept in the building where this policy covers.

The use of liquid acetylene, or of gas generated from liquid acetylene, is absolutely prohibited.

The Dalton-Ingersoll Company, 169-175 High street, Boston, Mass., are New England agents for the Thompson S. P. Smoke Testing Apparatus made by the Gunster & Forsyth Mfg. Company, and report an excellent demand for these machines in the territory they control. They have already sold a large number which have given most satisfactory results in testing plumbing systems. The machine is about to be tried by the Boston Department of Building and it is expected that their approval will lead to a still further increase in the demand for their apparatus.

Nominations for Officers of Engineers' Society.

The Nominating Committee of the American Society of Heating and Ventilating Engineers have made the following nominations for officers to be elected at the annual election to be held during the meeting January 25-27, 1898, at 12 West Thirty-first street, New York :

President.

Wiltsie F. Wolfe, Boston, Mass.
D. M. Quay, Chicago and New York.

First Vice-President.

J. H. Kinealy, St. Louis, Mo.
Harrie D. Crane, Cincinnati, Ohio.

Second Vice-President.

A. E. Kenrick, Brookline, Mass.
A. A. Carey, New York.

Third Vice-President.

John A. Fish, Boston, Mass.
J. J. Blackmore, New York.

Secretary.

Stewart A. Jellett, Philadelphia and New York.
B. Harold Carpenter, Wilkes-Barre, Pa.

Treasurer.

Judson A. Goodrich, New York.
Leroy B. Sherman, New York.

Board of Managers.

(Five to be elected.)

W. M. Mackay, New York.
Francis A. Williams, New York.
Thomas Barwick, New York.
John A. Connolly, New York.
J. R. Wendover, New York.
Newell P. Andrus, New York.
George B. Cobb, New York.
Wm. H. Clark, Lebanon, Pa.
J. A. Lansing, Pittsburgh, Pa.
Abram C. Mott, Philadelphia, Pa.

Council.

(Five to be elected.)

A. A. Cryer, New York.
B. F. Stangland, New York.
Wm. McMannis, New York.
W. S. Hadaway, New York.
W. H. Hill, New York.
John Gormly, Philadelphia.
R. C. Carpenter, Ithaca, N. Y.
Henry Adams, Washington, D. C.
Herman Eisert, Baltimore, Md.
John Hopson, Jr., New London, Conn.

The Council of the society at its last meeting announced that the ballots from the last mail vote had resulted in the election of the following new members :

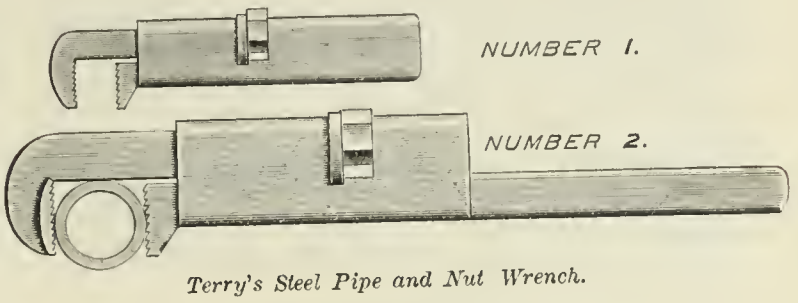
Robert Campbell, Brooklyn, N. Y.; E. T. Weymouth, Brooklyn, N. Y.; Juan A. Almiral, New York; Robert Ernest Atkinson, Leicester, England; Reginald Pelham Bolton, New York; Frank K. Chew, New York; Samuel Martin Green, Holyoke, Mass.; W. H. McKiever, New York; Sanford C. Smith, Buffalo, N. Y.; Claudius Wadsworth, Jr., New York, and Nelson Gordon Thompson, Washington, D. C., to Junior membership.

The Kelly & Jones Company.

Owing to their rapidly growing trade in foreign countries the Kelly & Jones Company have recently opened offices at 29 New Bridge street, London, E. C., England, in charge of Joseph Kelly, son of John T. Kelly, president of the firm. The Kelly & Jones Company are large manufacturers of Iron Pipe Fittings, Brass and Iron Valves, Cocks, &c., for steam, gas, water and oil. Also Iron and Steel Tubing of all kinds. Their works are located at Greensburg, Pa., and warehouses and offices are maintained at 311-315 First avenue, Pittsburgh, Pa.; 104 John street, New York, and 48-50 Clinton street, Chicago. The firm have made numerous shipments of their goods abroad, a large consignment recently going to Johannesburg, South Africa. They are meeting with a gratifying demand for their goods at home and abroad and at present are operating their plant to its full capacity. They regard the outlook for business as extremely encouraging. Their Pittsburgh house is in charge of George M. Jones, treasurer of the concern.

Terry's Steel Pipe and Nut Wrench.

The Terry Mfg. Company, Horseheads, N. Y., are offering a pipe and nut wrench, as here illustrated. The wrench is made entirely of steel with case hardened jaws. The thread is on the upper jaw, which runs through a heavy steel washer in front of nut, which makes it a swing jaw and gives it the action of a grip, to do away with any possibility of slipping on pipe or nuts. The wrenches are nickel plated. Wrench No. 1 in the cut represents the



Terry's Steel Pipe and Nut Wrench.

6-inch size, which takes ⅛ to ½ inch pipe. The 8, 12 and 18 inch sizes are of the style shown by No. 2, and take pipe from ⅛ to 3 inches.

NOTES.

The manufacturers of Steel Clad Copper Lined Bathtubs and All Steel Enameled Tubs have issued, under date of October 20, 1897, a new American standard list on these goods. Full particulars of the changes in prices will be found in our Trade Report columns.

The Brownley Mfg. Company have been incorporated in New York City to manufacture Steam Fittings and Plumbers' Supplies, with a capital stock of $50,000. The directors are William J. McQueen, Julius C. Druchlieb and John L. Thomas of New York City.

The Magee Furnace Company of Boston, Mass., are sending out a four-page circular of their Mystic Hot Water Heater. It is shown as a cast iron boiler without a casing and also with a casing of galvanized iron to prevent the cooling effect of the air striking directly on the outer surface of the water chamber. The last page presents a sectional view from which the construction may be readily understood. The boiler is made in five sizes rated to carry from 150 to 600 square feet of heating surface.

M. Carney, Philmont, N. Y., has recently secured the contract for installing a No. 303 Capitol Hot Water Heater in the residence of E. C. Wagner at Kinderhook, and for placing a No 304 Capitol in the Reformed parsonage at the same place. He is also installing a hot water system in the carriage repository of James Chesterman at Valatie, N. Y., and is to do the plumbing and setting of a No. 304 Capitol Hot Water Heater for Henry Best at Craryville.

Brown Brothers, Saginaw, Mich., bid $2700 and secured the contract for steam heating and ventilating apparatus for the public building in their city.

A difficulty between the dealers in plumbers' materials and some of the plumbers in Minneapolis, Minn., has led the Water Works Committee to consider the propriety of carrying and jobbing a line of plumbers' supplies.

L. Leidle & Co. are a new firm in the tinning and plumbing business at Fergus Falls, Minn., Mr. Leidle having had 27 years' experience at the tinners' trade.

The Anaconda Copper Mining Company have been granted a license to carry on the plumbing business at the corner of Main and Court streets, Butte, Mont.

C. F. Pfeffer of Denver, Col., bid $3011 and secured the contract for placing a steam heating system in the quarters of the commanding officer at Fort Logan.

A. V. Fetter has moved his plumbing establishment to the corner of Fifth and Jay streets, La Crosse, Wis.

The contract for furnishing heating and ventilating apparatus and an electric lighting plant for School No. 12, New York, has been awarded to the Foskett & Bishop Company of New Haven, Conn.

E. Y. Wilkes has established a plumbing shop in the basement of 210 South Broad street, Trenton, N. J.

R. M. Wilson, Rome, N. Y., is displaying at his New York salesroom, 92 Walker street, one of his newest productions in the Bathtub line. He has during the year completed a fine plant for the manufacture of Enameled

Cast Iron Bathtubs, and the sample on display speaks well for the character of the output. The plumber who is using Enameled Bathtubs is invited to examine this new line and secure prices. The sample is of the French pattern with narrow roll rim.

E. P. Johnson, secretary of the Plumbers' Union of Lexington, Ky., has opened a plumbing establishment at 180 East Main street.

Hilborn & Faulkner, Bucyrus, Ohio, are removing their plumbing establishment to North Sandusky avenue.

The north side of the new bakery block on Portland street, Morrisville, Vt., has been rented by H. J. Bonette, a plumber, gas and steam fitter and tinsmith with 30 years' experience. For the present Mr. Bonette establishes a general plumbing, jobbing and repair shop, with the expectation that in the spring, if the outlook is favorable, he will put in a general tin and hardware stock.

Kieffer Bros., Syracuse, N. Y., who make Stove Repairs a special branch of their business, have been awarded the contract for plumbing a new school building.

The Superior Mfg. Company of Cleveland, Ohio, with $25,000 capital stock, have been incorporated. The object is to manufacture jobbing brass and rubber specialties, plumbing supplies and other articles. W. E. Byrnes, M. D. Hunt, H. B. Halloch, C. C. Brackin and David B. Carpenter are the incorporators.

James W. Brown, inspector of plumbing, Brockton, Mass , has invented and is taking out patents for a new roof vent device for plumbing systems.

A plumber of Washington, D. C., has been brought before the Police Court for violating the plumbing regulations by using light cast iron soil pipe where heavy pipe should have been used.

An explosion caused by gas from the street main did a damage of $10, 00 recently at Providence, R. I., the force being sufficient to throw stones to a considerable distance. It seems difficult if not impossible to provide gas pipes which will prevent the loss of gas through them. It is a well known fact that the gas companies in estimating cost allow for a large percentage of gas to be lost through the pipes, and that whenever a street is opened there is a strong odor from the gas impregnated soil. This smell in the summer season is extremely offensive to the occupants of buildings along the street where such an opening is made.

Braman, Dow & Co., Worcester, Mass., bid $1635 and secured the contract for heating the city almshouse.

The Standard Steam Specialty Company have recently been incorporated in New York City to manufacture steam and electrical specialties, with a capital stock of $15,000. The directors are Herbert Joslin, William H. Long and Elbert Crandall of New York City.

Any one who is interested in securing an established business in plumbing, heating and light hardware, in a good location in Massachusetts, will do well to notice the Special advertisement in this issue signed "Exchange," in which is described a business paying $4000 a year that the owner wishes to sell or exchange.

A new concern, known as the Westfield Tank, Seat and Bracket Mfg. Company, have leased the C. N. Thompson piano leg factory, at Westfield, Mass., and will manufacture plumbing supplies in the wood line. Holyoke parties are backing the new concern.

Churchill & Washburn, Brockton, Mass., have just completed the plumbing and automatic sprinkler equipment for the new factory of the Geo. E. Keith Company, and are now equipping the M. F. Thomas factory in like manner. In both factories the Webster vacuum system of steam heating is used.

Bogue & Oates, 571 Detroit street, Cleveland, Ohio, have secured from the Police Department of the city of Cleveland the contract for a steam heating plant in the Sixth Precinct Station House, where they will use a No. 6 Champion Steam Heater made by the Thatcher Furnace Company.

Clifford Schlemmer, who is the Eastern agent for the O. S. Distributing Fittings manufactured by Oliver Schlemmer, Cincinnati, Ohio, informs us that the demand for these Fittings has been such as to necessitate the carrying of a large stock in New York City so that orders can be filled promptly, and that he has secured warehouse space, and orders placed at the New York office, at 109-111 Beekman street, will receive prompt attention.

The Clarence H. Rose Mfg. Company, 96 Centre street, New York, send us a budget of printed matter in which they show Quarter Bends, Slip Joint Connections for water closets, a Closet Nut and Tail Piece, a Nickel Plated Slip Joint Nut and Flange, and a circular showing by means of half-tone engravings a variety of Lavatory Legs, Nickel Plated Basin Supply Pipes and Conductor Strainers. Prices are given on the circulars, which will be sent to all who desire them.

Arnold Behrer, who for a number of years has made acquaintances in the plumbing trade as a representative of Peck Bros. & Co., is now on a trip among the trade for himself, having recently taken an interest in the plumbing supply house established by Behrer & Co. at 69 Beekman street, New York.

The business of the season is making things lively for the Nason Mfg. Company, 71 Beekman street, New York. They inform us that the demand for Pipe, Fittings, Steam Traps, Valves, Radiators, Equator and Gulf Stream Boilers is quite brisk and a very pleasing tribute to their efforts to meet the requirements of the trade.

At the regular monthly meeting of the Vance Boiler Works, Geneva, N. Y., it was reported that all of the stock of the company was sold, and that the company had been obliged to light the plant by electricity so that an increased force of men could be worked in order to fill the orders that have been placed with them.

The Mulhern Steam Heating Company of New York City have been incorporated, with a capital stock of $50,000, to manufacture Steam Heating Appliances. The directors named are James F. Mulhern, John T. Easton and Richard K. Cooke of New York City.

The John Simmons Company, 106-110 Centre street, New York, are sending to the trade what might be termed an emergency notice. It is addressed to "Fitters and Foremen," and states "we have arranged with our foreman, J. Kenny, to wait upon you in cases of emergency. He holds the key of our pipe cutting shops and warehouses at his residence at 157 Grand street, New York, and will deliver material for rush or breakdown jobs on Sundays and holidays."

The Schlafer Hardware Company, Appleton, Wis., have recently secured a large contract for furnishing the sheet iron piping for the heating system at the mill of the Falls Mfg. Company at Oconto Falls. The heat will be taken from steam coils and distributed through the mill by a Sturtevant blower. The pipes range in size from 38 inches in diameter downward.

O'Keefe & Long, Appleton, Wis., were awarded the contract for plumbing in the addition of the Sherman House. The plumbing includes 11 closets, four and perhaps eight bathtubs, six basins and heating apparatus for same.

We have received from the John Simmons Company, 106 Centre street, New York, a sample of the Black Diamond Steam Hose, another specialty put out by this Iron Pipe, Fittings and Steam Supply House. The Hose is presented as having an indestructible cover and a steam proof tube, with the statement that the best grade of Steam Hose is cheapest in the end. The inside tube is made of a special compound said to be proved by experience to resist the destructive action of steam, while the cover is claimed to be particularly tough and practically indestructible. Marlin winding is recommended where the pressure exceeds 80 pounds or to protect the Hose from cinders. Sizes and prices are given on a card accompanying the sample.

The Brainerd, Tanner, Gallien Company, 72-74 Church street, Albany, N. Y., have just been incorporated, with a capital of $25,000, which it is said is all paid in. The Dickson plant has been secured and is now being rearranged to manufacture Builders', Piano, Cabinet and Plumbers' Hardware, Dickson Transom Lifters and Openers and Hardware Specialties. The officers are B. M. Gallien, president and treasurer; H. J. Brainerd, vice-president, and W. F. Tanner, secretary. The company have a salesroom and office in New York at 107 Chambers street in charge of H. J. Brainerd.

The United States Secretary of Agriculture in his annual report to the President recommends that agents of the Department of Agriculture should be stationed at each of the important American embassies abroad for the collection of information of interest to American farmers.

It is in contemplation to build an extension of the Philadelphia & Reading Railroad from Reading, Pa., to Chesapeake Bay, at some point at which deep water can be obtained. The idea of the extension is to convey iron ore, coal, &c., from the mines to tide water, where it is proposed to locate a manufacturing town.

A cable dispatch from Constantinople, Turkey, says that agents of Armstrong's Elswick Works, in England, and of the Krupps of Essen, Germany, are now in that city with proposals for the reconstruction of the Turkish Navy. The contest between the British and German interests in this matter is being keenly watched.

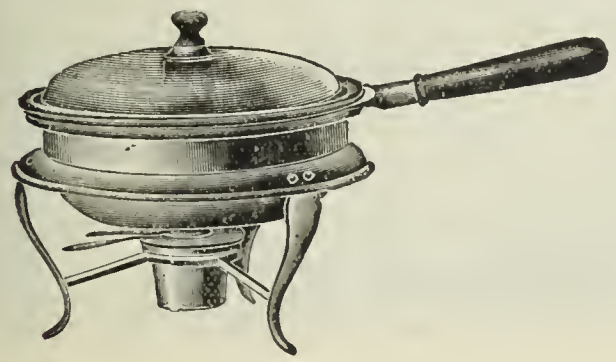
THE RETAIL STORE.

Cleaning Aluminum Ware.

One reason why aluminum utensils and other ware have not found more favor with the general public is, in all probability, because the proper method of keeping the ware in order has not been known. Reymond & Gottlob, 831 Broadway, New York, who handle a very large line of aluminum goods, advise us that they have only lately discovered that the preparations which are generally used for cleaning silver are inimical to aluminum. Soda or ammonia, in particular, should never be used for the purpose. Polished aluminum ware in general use should be cleaned with plain water only, a little fine sand being employed in case the inside of the article becomes dark from the food. If the outside becomes dull special aluminum polish, with a little whiting, should be used. Satin or frosted finished articles should be cleaned with soap and water when soiled. If these directions become known they believe that aluminum cooking and table ware will become more appreciated by the public.

Aluminum Chafing Dish.

Reymond & Gottlob, 831 Broadway, and Havemeyer Building, 26 Cortlandt street, New York, are placing on the market the new aluminum chafing dish, illustrated herewith, which they claim to be, for efficiency, economy and simplicity of operation, equal to any chafing dish in the market. The best method of using the dish is described as follows: 1. Remove the water bowl, and bring the cooking dish into direct contact with the lamp. 2. Have the water bowl at hand full of boiling water. 3. When ready to serve put back the water bowl, and the lamp can either be extinguished or allowed to burn, but under any circumstances the food will be kept hot. It is



Aluminum Chafing Dish.

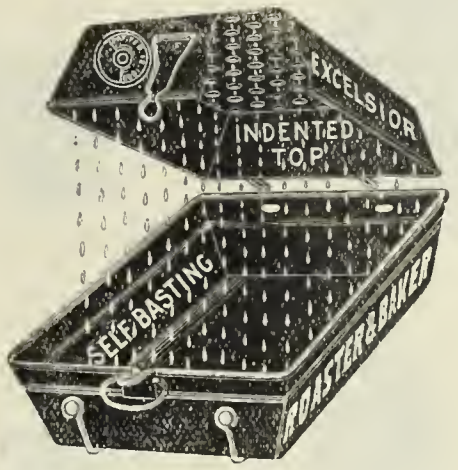
pointed out that a chafing dish in this form and made of aluminum possesses many advantages, being light in weight and easily handled, attractive in appearance, durable, easily cleaned and absolutely wholesome. On account of the high heat conducting qualities of aluminum the dish has, moreover, a special advantage as a quick cooker. Its price is referred to as being as low as that of the best made nickel plated chafing dish. The dish, stand and lamp are of spun and stamped aluminum, and the handle of black wood.

Aluminum Supplies.

The Pittsburgh Reduction Company on November 1 closed their New York store at 10 and 11 Havemeyer Building, Cortlandt and Church streets. The company have arranged that the firms of Patterson Bros., metal dealers, 27 Park row, and Reymond & Gottlob, who have gone into occupation of the former premises of the Pittsburgh Reduction Company in the Havemeyer Building, will each carry a retail stock of aluminum in the form of ingots, plates, bars, sheets, rods, wire and tubing, to supply the local demand for these materials in and around New York City. All large orders the Pittsburgh Reduction Company request to be sent to them at Pittsburgh, Pa. B. C. Bakewell, who has been connected with the Pittsburgh Reduction Company for the past five years at their works at New Kensington, Pa., and at their Chicago and New York branches, remains as manager for Reymond & Gottlob. The last named firm will carry a very full stock of aluminum of all kinds at their new store, as well as an extensive line of aluminum household utensils and novelties. Reymond & Gottlob's headquarters will continue to be, however, as heretofore, at 831 Broadway, New York.

Excelsior Self Basting, Roasting and Baking Pan.

Barber-Koenig Mfg. Company, Hazleton, Pa., are putting on the market the Excelsior roasting and baking pan, illustrated in the accompanying illustration. The spe-



Excelsior Self Basting, Roasting and Baking Pan.

cially new feature of this pan is the indented top, which makes it self basting, the steam rising to the top of the pan and condensing, dropping back upon the roast at the points of indentation. The wire shoes shown are designed to prevent burning of contents and allow free circulation of heat under the pan, thus doing away with the inside tray or grate. It is stated that the top pan fits inside the lower pan, and hence the steam rising to top pan and condensing must run back into the lower pan and not into the oven. Ventilators are provided allowing a current of air in and out of the pan, and a proper adjustment of these enables the cook to roast or bake to suit family requirements. The manufacturers refer to the simplicity of construction of the pan as making it easy of adjustment, readily handled and easily cleaned, besides securing durability. The pans are made of planished and tri-color steel in seven sizes, varying from 6½ to 14 inches in width, 10 to 19 inches in length and 5 to 9 inches in depth.

Retail Hardware Organization.

The following letter from a prominent house in this State will be read with interest, suggesting as it does the necessity of organized effort among retail hardware merchants in the East for their protection against department stores and catalogue houses and the interference with their customers by jobbers and manufacturers. From the way in which our correspondent refers to the matter it is evident that the energetic efforts which are being made in the West are directing attention to the evils which confront the trade in other sections:

Have been reading with great interest for some time discussions regarding Minnesota Retail Hardware Association, besides other movements in the West, and wondering why it is we dealers in the East sit idly by and see our brethren working assiduously to bring about a state of affairs which would certainly be much more pleasant than at present.

Time was when the hardwareman could do a good business and lay aside a small amount for a time when he should be relegated to the past, but now, with the incubus of department stores and catalogue houses, and would-be wholesale retailers, and with manufacturers and large jobbing houses, the regular retailer has hard work to live —indeed, at times feels he must take his pick and shovel and go on the street, provided he has a "pull;" otherwise he could not do that.

The stores mentioned above are a curse to the country at large, and I think the retailers of the East should make some move to better their condition before it is everlastingly too late. The jobbers and manufacturers are greatly to blame for supplying the octopus.

Why cannot some move be made to start a retailers' association ?

Will you, through your paper, bring this matter to the notice of the retail hardware merchants and see if the East has not as much "git up and git" as our brethren in the West.

Novelties in Enameled Ware.

Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, have brought out a number of new articles in enameled ware. Fig. 1 is a seamless pitcher with swinging and side handles. This is designed for the use of hall boys in hotels answering calls from guests for ice water, the supply being carried in this receptacle and emptied into the earthen pitcher in the room. They are made in

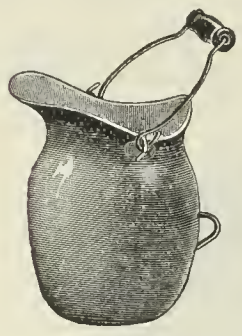


Fig 1.—Hotel Ice Pitcher.

Fig. 2.—Gravy Boat.

Fig. 3.—Syrup Cup.

Fig. 4.—Mustard Cup

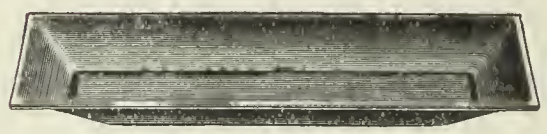

Fig. 5.—Candy Pan.

3 and 4 quart sizes. Fig. 2 represents a seamless gravy boat, with a capacity of 1 pint. Fig. 3 illustrates a syrup pitcher, holding 3 pints, and is fitted with a metal cap. Fig. 4 shows a mustard cup, size 1 gill, with detached enameled cover. Fig. 5 illustrates a seamless rectangular candy pan, the dimensions of which are 22¼ x 8¼ x 1⅞ inches. This is made in white enamel with blue border only, the other articles being the usual mottled enamel. In addition to the goods illustrated the company are making new lines of seamless water and toilet pitchers, seamless toilet bowls and extra large cereal and fruit cookers, with bails, having capacities of 6, 9, 14 and 18 quarts.

Aluminum Chafing Dishes.

The accompanying cuts represent aluminum chafing dishes put on the market by the Illinois Aluminum Com-

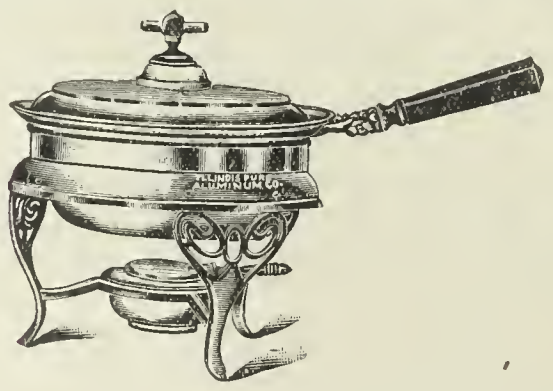

Fig. 1.—Aluminum Chafing Dish No 3.

pany, Lemont, Ill. No. 3, shown in Fig. 1, has cast aluminum legs and polished chafing dish and water bowl, finished with ebony knob and handle. The handle of the chafing dish fits into a cast aluminum socket. It is referred to as not only a neat and serviceable dish, but also as comparatively inexpensive. The dish shown in Fig. 2, and catalogued as No. 5, is more elaborately ornamented and is higher in price. It has a cast aluminum stand. The water bowl and chafing dish are highly polished, and

Fig 2.—Aluminum Chafing Dish No. 5.

the water bowl has two cast handles of black ebony. The handle fits into a cast aluminum socket. The whole dish is spoken of as being well finished in every respect.

Steam Cereal Cooker.

Sidney Shepard & Co., Buffalo, N. Y., are marketing a steam cereal cooker, as illustrated herewith. The utensil consists of a large lower pan to hold the water, a rack to hold the upper pan or food receptacle and an upper vessel to receive the food material. In use the hot, moist

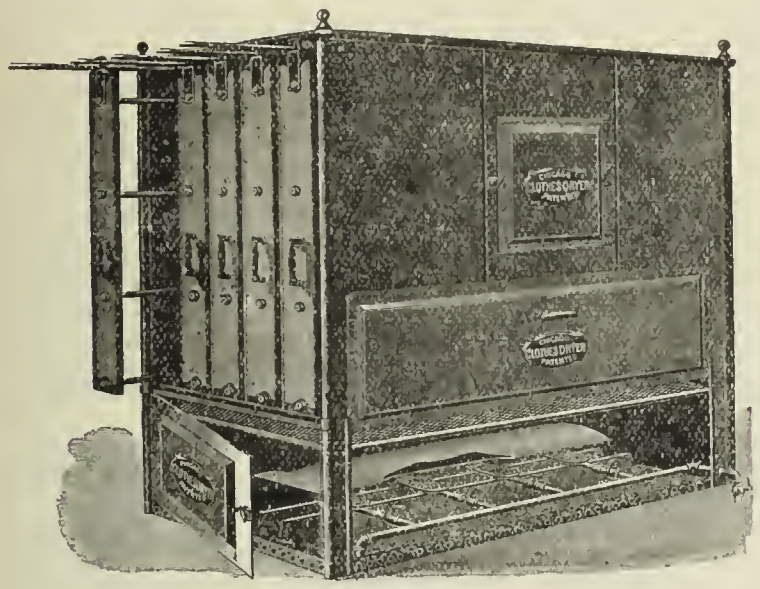
Steam Cooker for Cereals.

steam rises through the small holes in the rack, and finding a reservoir formed by the cover and food pan, circulates over and through what is being cooked. In this way cereals can be thoroughly cooked without danger of being scorched or requiring much attention.

The Chicago Laundry Clothes Dryer.

An illustration is herewith given of a gas heating laundry clothes dryer now being manufactured by the Chicago Clothes Dryer Works, 65 South Canal street, Chicago. The operation of this apparatus is readily understood from the cut. It is intended to enable laundry work to be completed indoors, avoiding the unsightly "wash" hanging in a back yard, together with the discomforts of hanging out clothes in disagreeable weather and having them perhaps subjected to soot or dust while in the open air. The dryer contains racks which slide in and out. The clothes are hung on the racks as soon as they are washed and wrung. With the gas burners in operation below, the drying proceeds nearly as fast as a laundress can wash. It is substantially made of metal throughout, so as to be thoroughly fire proof, while the parts are galvanized so that they will not rust. The gas equipment consists of atmospheric air burners, effecting perfect com-

bution. The heat is distributed equally throughout the dryer, and a system of ventilation insures bleaching as well as would be done by sunshine. The dryers are built of various sizes, and can be made specially to suit a given space. The company manufacture a variety of styles. One form of dryer which is very popular has a steam coil in place of gas burners for use where steam is available.



The Chicago Laundry Clothes Dryer.

They also make a combination laundry stove and dryer, the stove not only heating the dryer but also being available for boiling clothes and heating sad irons.

MEMORANDA.

Austin Wells, manufacturer of Tinware and Roofing, Muncie, Ind., is erecting a two-story brick building for his business on Howard street, in that city.

Keen & Hagerty, Baltimore, Md., are among the latest concerns who have taken up the manufacture of Enameled Ware. They are producing a handsome line of Household Utensils under the name of Gray Flint Ware, which are now being placed on the market. The firm's large factory at Baltimore is reported as busy in all its branches, turning out a very large output of Tin, Galvanized, Japanned and Enameled Ware, for all of which an active demand is experienced.

Lewis D. Wynn, Sterling, Ill., reports his business as nearly 100 per cent. better for July, August, September and October of this year than for the same months during 1896. Mr. Wynn states that he has made some improvements in his machinery for the manufacture of the Black Silk Stove Polish and also in the Polish.

Kieckhefer Brothers Company, Milwaukee, Wis., have been compelled by the large increase in their trade to add more room to their already great plant for the production of pieced and stamped Tinware, Granite Steel Ware and other sheet metal goods. They are adding two stories to one of their buildings which was erected only three years since, extending 300 feet along St. Paul avenue, and building an ell 50 x 200 feet. The increase thus made in their floor space will be about 50,000 square feet.

The Diamond Stamped Ware Company have organized at Detroit, Mich., with a capital of $50,000, to manufacture Tea Kettles, Coffee Pots, Saucepans and other utensils of copper and brass. The plant of the new company is located at River and Clark streets, in the building formerly occupied by the Galvin Brass & Iron Works. The directors are Oliver Goldsmith, R. W. Gillett, L. H. Jones, W. A. Montgomery and C. D. Milne.

The tin shop of J. W. Maxim, Warren, Mass., was destroyed by a fire which practically wiped out the business section of that town on October 31. The loss is placed at $3000, partly covered by insurance.

A. W. Pritchett has taken charge, as manager, of the New York branch of Keen & Hagerty of Baltimore, Md., at 101 Beekman street, in succession to S. W. Milligan, who has been obliged to retire from business on account of ill health. Mr. Pritchett has traveled in the interests of Keen & Hagerty for a number of years through the States of New York, New Jersey, Pennsylvania and Ohio and is well known to the trade at large.

The Morse Hardware Company, New Whatcom, Wash., are building an addition to their establishment. The addition will be 27½ x 60 feet in dimensions, two stories, and is referred to as an actual necessity to meet the requirements of their increasing business. The enlarged establishment will have a floor space of 10,174 square feet, exclusive of tinshop and warehouse. The company do a wholesale and retail business in Hardware, Stoves, Tinware, Iron, Steel and Mill and Mining Supplies. Trade is alluded to as steadily improving.

F. W. Myer has opened a new Hardware store at Manitowoc, Wis. Mr. Myer is a retailer of Shelf Hardware, Stoves, Tinware, Sporting Goods, &c. He refers to his store as one of the neatest in the city, with hardwood floor and electric lighted.

J. L. Swank has opened a new Hardware store at Colusa, Cal., carrying Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements and Sporting Goods.

C. D. Foard, Wilmington, N. C., has removed his stock into a more commodious building at 29 South Front street. Mr. Foard handles a general line of Hardware, Stoves, Tinware, Sporting Goods, &c., dealing both in wholesale and retail business.

J. A. Plumley, 430 East Twenty-third street, Baltimore, Md., is manufacturing the Plumley fruit picker, which is intended for picking apples, peaches, pears, plums and oranges. The picker consists of a handle 10 feet long, and what is called a conveyor, which is 12 feet in length. This combination is referred to as suitable to pick any ordinary tree, but the handle and conveyor can be lengthened by splicing to pick any fruit tree. In using the device the fruit after being detached from the tree is transferred by means of the conveyor to the basket, barrel or other receptacle. By placing the hand at the opening at the lower end of the conveyor it is pointed out that all bruising of the fruit is avoided. The picker weighs 2 pounds complete, and is referred to as very durable and easily handled by a woman or child.

D. W. James, Jr., a Hardware salesman of long experience and wide acquaintance, has located in Chicago, in room 603, at 60 Wabash avenue, representing the Haberman Mfg. Company of New York.

Kieckhefer Brothers Company, Milwaukee, Wis., last week shipped two carloads of their goods, embracing a full line of Tinware and Granite Steel Ware for household equipment, to Honolulu, Hawaiian Islands.

D. McGregor, formerly a dealer in Farm Implements exclusively, at Caledonia, Ontario, has made a number of improvements in his establishment and has enlarged his stock by the addition of a line of Hardware, Stoves, Tinware, Glass, &c.

A new Hardware store will shortly be opened at Grafton, N. D., by J. A. Douglas. Mr. Douglas will handle Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

J. R. Silkenson, dealer in Harness, Alsen, S. D., has added a full line of Shelf and Heavy Hardware, Stoves and Tinware. Mr. Silkenson has also erected an addition to his store, 18 x 20 feet.

John Watson has lately opened a new Hardware store at 712 Elmwood street, Port Huron, Mich., handling in a retail way Shelf Hardware, Stoves and Tinware. Mr. Watson advises us that business is opening up well and that the prospects are encouraging.

C. A. Hedlund & Co. have succeeded A. P. Erickson in the retail Hardware, Stove, Tinware and Sporting Goods business in Holdrege, Neb.

The Evart Hardware Company, Evart, Mich., wholesale and retail Hardware, Implements, Crockery, Harness, Lumber, &c., have added a Stove department to their business. The wareroom devoted to this line is 44 x 60 feet in dimensions and is, we are advised, an especially attractive and convenient one.

Anthony Wayne Mfg. Company, Fort Wayne, Ind., Neal & Brinker, Eastern agents, 168 Church street, New York, have added to their list the Cyclone churn, which is made in three sizes, Nos. 1, 2 and 3, churning 4, 6 and 8 gallons respectively. They have also commenced the manufacture of the I X L bread board, and Nox All ironing table.

Newton A. Ballard and Arthur M. Clark of Webster, Mass., have purchased the Hardware and Furniture business of J. E. Taylor, Putnam, Conn., and will continue it at the old stand under the style of Ballard & Clark. A wholesale and retail trade is done in Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, Crockery, Furniture, &c.

Statistics just issued by the Department of Internal Affairs of Pennsylvania show a marked falling off in the production of coke in that State last year. The output for 1896 was 6,613,180 tons, as against 8,922,329 tons in 1895.

TIN PLATES.

Tin Scrap.

In the course of a recent conversation with a broker in scrap metals, the information was developed that there is a very large and steady export movement of tin scrap from the Atlantic Coast to Europe. The amount of tin plate clippings made by the large tinware and can making factories of the country is very considerable. Some of the more extensive works in this line put out from 50 to 100 tons of scrap tin monthly. This material, in most instances, is sold to exporters under a yearly contract. It is baled at the factory and shipped to Antwerp, from whence it is sent to a separating works in Holland, where, by a special process, the tin is recovered and made into pigs, while the steel scrap is sold for various purposes. The average value of the tin plate scrap, in bales, delivered at the dock in New York is about $5 a ton. Some of the smaller tinware factories, which have no facilities for baling their scrap, dispose of it loose to the manufacturers of sash weights.

SCRAP.

Arrangements have been made by the Granite City Steel Works, Granite City, Ill., to put down a universal mill to roll Structural Material, Sheet and Tin Plate Bars, Blooms and Billets, &c.

It is understood that the arrangement referred to lately in these columns whereby the interests of the Shenango Valley Steel Company, the Shenango Tin Plate Company, the Neshannock Furnace and the New Castle Steel & Tin Plate Works, all of New Castle, Pa., are to be consolidated, will not go into effect in its entirety until the spring.

The plant of the Pennsylvania Tin Plate Company, New Kensington, Pa., is to be enlarged by the addition of two new hot mills, for which the contract has been given to the Frank-Kneeland Machine Company, Pittsburgh, Pa. This will make the Pennsylvania a six-mill plant. The present engine power will be sufficient to drive the new mills.

Late cable advices from England report that several of the Welsh Tin Plate works have been shut down owing to a portion of the workmen refusing to accept the reduction of 15 per cent. agreed to by the Tin Plate Workers' Union.

The latest industrial returns of the British Board of Trade show a continued falling off in the Welsh Tin Plate industry. At 87 works, at the beginning of October, only 273 mills were at work, while 211 were idle, out of a total of 484. In 1896 at 88 works there were 306 mills working and 176 idle, out of a total of 482.

There seem, from latest accounts, to be an increasing number of defections from the ranks of the Tin Platers' Union in South Wales. At the Morfa Tin Plate Works, Llanelly, an agreement, to last for three years, was recently signed by the men whereby the latter consented to sever themselves altogether from the union, while the owners agreed to pay during that period the average rate of wages in the trade. The Morfa Works have now been started up on this footing after a long period of idleness. Taken together with the news cabled last week that the union had decided to accept a reduction of 15 per cent. from the 1874 wage list, this seems to mean a defeat for the cause which the officials of the union have been fighting for so persistently—namely, the maintenance of the 1874 list. Under the present depressed condition of the Welsh Tin Plate industry and the low prices for their product it would be surprising if the makers could continue to pay the same wages they were giving 23 years ago, when prices were at nearly double the present level and the United States furnished them with a large and steady market.

The American Tin Plate Company have just issued from their sales office, 1118 Marquette Building, Chicago, a quotation sheet, D, giving prices on their various brands of Tin and Terne Plates and Taggers Tin. Base prices are given on 14 x 20 Plates, 112 sheets to the box, and arranged under six heads—namely, Kanner and Koko, Kream, L-Wood, Charcoals, Taggers, and Ternes—on each of which a base price is given. The prices of the different varieties of Plates are calculable by means of a table on the system introduced by the American Tin Plate Company some time back and fully described in these columns. Thus, for Koko Coke Plates 5 cents a box advance on the base price is charged for 80 pounds, 7½ cents for 85 pounds, 10 cents for 90 pounds, 15 cents for 95 pounds, 20 cents for 100 pounds, 30 cents for IC, 80 cents for IXL and 90 cents for IX. A similar plan is followed for all the other Plates manufactured by the firm. Wasters, IC and lighter, are 25 cents a box less and IXL and heavier 35 cents less than primes.

It is reported that the Atlanta Steel & Tin Plate Company, Atlanta, Ind., are contemplating building a large addition to their plant.

Ground was broken last week for the erection of a new Tin Plate plant of the Johnstown Tin Plate Company, at Johnstown, Pa. It will be remembered that the Totten & Hogg Iron & Steel Foundry Company of Pittsburgh have the contract for the erection of this plant.

The dimensions of all the buildings for the new Tin Plate plant of the Shenango Valley Steel Company of New Castle, Pa., have not yet been arranged. The size of the main building has been determined, and it will be 108 feet wide and 1152 feet long, with two leantos of 27 feet each. The boiler house will be 40 x 170 feet by 34 feet high. The contract for these buildings has been placed with the Shiffler Bridge Company of Pittsburgh. It has been definitely decided to locate the new plant between New Castle and Mahoningtown, where a site of about 40 acres has been secured.

The American Tin Plate Company, Elwood, Ind., have started their new automatic Bar mill, rolling tin plate bars from 6 x 6 standard steel billets, weighing 800 to 900 pounds. The product of this mill is 250 tons single turn. It is only intended to run single turn at present, as the output is sufficient for the existing capacity of their finishing departments. The mill is modern in every respect, having the most approved labor saving devices.

As announced in these columns last week, the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., will make some extensive improvements and additions to their plant. They have decided to do away with their Bar Mill and are at present dismantling it. The concern will have for sale a Bar Mill, Squeezers, Heating, Puddling and Scrap Furnaces.

Recently there has been a very large influx of tin plate workers to New Castle, Pa. They are attracted to that place by the fact that two large tin plate plants are about to be erected there.

Charles G. Smith, who is a manufacturer of carriage lamps, lamps and lanterns, at 352 Pearl street, New York, has opened a branch at 96 John street, New York.

The yellow fever epidemic in the South is subsiding.

The George L. Squier Mfg. Company of Buffalo, N. Y., are now equipping some 170 school buildings in Chicago with Crystal Fountain Filters. They have also just been awarded the contract by the United States Government for putting Crystal Fountain Filters in the District of Columbia schools.

I. P. Frink, 551 Pearl street, New York, advises us that he has recently installed his patented system of reflectors in the art galleries of the following well-known department stores : Abraham & Straus, Brooklyn ; Bloomingdale Bros. and R. H. Macy & Co., New York ; Hahne & Co., Newark, N. J.

The largest single cash purchase of oil territory ever made by the Standard Oil Company has just been concluded by the acquisition of the Chipmunk oil field, near Titusville, Pa., for the sum of $1,400,000. The holdings purchased were owned by the Emery, Devonian and Matson oil companies, and possess an aggregate of 425 wells, with a daily output of 5000 barrels.

STOVE TRADE NOTES.

THE NEW YORK STOVE TRADE.

The stove trade has not reflected the improved conditions in general trade, as it was expected to. The volume of business done at this time of the year depends altogether upon the weather, and that factor must be taken into account in all calculations or estimates made at the threshold of the fall trade or they are liable to be wrong. October is one of the vital months in the stove business and the aggregate of sales this year was far from satisfactory. The weather was very unfavorable almost throughout the month and in the best of times would have affected the trade, so that in a year like the present, when the country is but just emerging from a long period of depression, dealers are apt to pursue a conservative course if the weather is not such as to compel the purchase of stoves for immediate sale. To stock up in spite of unfavorable weather conditions constitutes too much of a risk at a time when bank accounts are not plethoric and carried over stocks must be paid for. The adverse weather conditions have robbed the stove people of a share in the first flush of returning prosperity, which nobody will deny they needed as much as any other line of trade.

On the other hand, it is not impossible to make up all that may seem to have been lost by bad weather and not improbable that it will be made up if cold weather comes soon. Trade gets later every year and is much later than it was five or ten years ago. The manufacturer has to carry the stock and dealers more generally order from hand to mouth. The manufacturer is obliged to keep in close touch with the dealer because of his manner of ordering fewer stoves and oftener. Salesmen who a few years ago were compelled, with the advent of September, to cease their daily rounds and remain in the stores to help floor salesmen, now keep canvassing throughout the season. Responses are quicker when the weather changes cold than formerly, and, *vice versa*, trade stops quicker when it turns warm again.

In former years, when dealers carried larger stocks, the traffic was more steady; orders were for full lines of stoves, sundries and repairs; larger loads were delivered and the stocking up period was one of much activity and much business, but steady, rational and satisfactory. Nowadays the trade is fraught with disappointment at the smallness of orders, which no amount of urging will suffice to enlarge, and with hurry and feverishness when the weather excites demand. Everybody wants a few stoves at once and nobody can wait a minute, and if they are not delivered one day and it should be warm the next they are countermanded and sent back. It is no unusual thing on a warm day for the wholesale stores to be as dull as on Sunday and the next day, if cold, for everybody to be head over heels with business. The telephone will keep ringing the entire day, messengers and errand boys will run in with orders, extra trucks must be hired and sent flying in every direction and the ordinary work of three days crowded into one. The exactions on the patience, nerves and health of those concerned in the wholesale stove business are vastly greater than ever known in the history of the industry, and it may almost be said that so far as the pleasure of doing business is concerned there is none.

No business in a staple article like stoves can be conducted indefinitely on an unprofitable basis, which the abuses of the past few years have brought the stove trade to, and if returning prosperity does not stimulate demand up to the capacity of existing foundries to work its own corrective, it seems evident that some agreement for the reform of such abuses must be made by the wholesalers.

THE VENTING TOOL.

BY THOS. F. KENNEDY.

When making molds for iron castings in very close clayey sand it is necessary, even with very small ones, to resort to mechanical means to make the sand more porous. It is also necessary in the case of thin castings of large area or thick ones of certain shapes, even when made in the most open sand that can be used in the making of green sand molds, first, to allow the free escape of the air in the mold and sand ; second, to carry off the steam generated when the molten metal comes in contact with the damp sand ; third, to provide for the escape of the gases contained in the metal and of that produced from the facing and sand by the heat of the metal.

On small and medium size castings made from patterns and rolled in a flask, and even on large ones made thus, artificial porosity is obtained by what molders call venting—that is, by piercing the sand of the mold from the outside to or nearly to the pattern with a metal rod or wire. I do not propose to touch on work bedded in the floor, or very heavy work; for while the principle is the same the treatment is necessarily more elaborate. The vent wire or rod is the most essential of the molders' tools. Some makeshift can be contrived instead of any one of the other tools, but for venting through a hard body of sand he needs a metal wire or rod.

The venting tool is without doubt the crudest that can be found around a foundry. Whatever the metal used by the earliest molders, whether iron, copper, steel or bronze, their venting tool could not have been more primitive than those in use in the most up to date foundries of today. This cannot be truthfully said of any other tool or part of the equipment of a modern foundry.

Old discarded umbrellas with round ribs of spring steel furnished the material for nearly all the small vent wires used in stove foundries in the last decade. This source of supply will not last much longer, as the umbrellas made in the last few years have ribs of a thin strip of steel bent to the shape of the letter U. A molder cuts off the desired length from one of these round ribs, and at least in one-half the cases proceeds to use it forthwith. Sometimes he puts a wood handle on it, or he may grind it off at an angle of 30 to 40 degrees. Whether he puts a handle on it or grinds it, the end used to pierce the sand becomes worn in a short time to the size of a needle for the first inch or so from the point.

I have seen molders using these umbrella rib vent wires when they did not exceed 1-100 inch in diameter ¼ inch from the point, and I am sure nothing but a lack of knowledge how to compute areas from known dimensions and compare them ever kept the molder at work pushing his vent wire into the mold 100 times to obtain a venting area hardly equal to 1-100 part of a square inch. I do not want to convey the impression that I am of the opinion that a few large vent holes are as good as numerous small ones. What I want to call attention to is what very little good a vent wire does when it is worn to the dimensions of a needle near the point and does not make its maximum size hole till 2 or 3 inches from the point.

I believe it is well within the facts that have come under my observation to say that 99 out of every 100 molders, if asked the difference in area between a hole ⅛ inch diameter and one ¼ inch diameter, would say the latter was twice the size of the former and would be still more confused if asked the difference between a circle 1-64 inch diameter and one 1/16 inch diameter. I append herewith a table of areas of circles the diameters of which are frac-

tional parts of an inch, which will enable any one to make comparisons.

Areas of Small Circles.

Diameter of circle.	Area of circle in decimals.	Area in common fractions.	Number to 1 inch diameter.	Number to square inch.
1/64	0.0001932	1/5100	4096	5100
1/32	0.00076	1/1300	1024	1300
1/16	0.0029	1/340	256	340
3/32	0.0068	1/145	113	145
1/8	0.012	1/84	64	84
3/16	0.027	1/37	28	37
1/4	0.049	1/20	16	20

For instance, comparing 1-64 inch diameter with 1/8 inch diameter, we see that 1/8 inch has an area 64 times greater than 1-64 inch diameter ; while it requires over 5100 holes 1-64 inch diameter to equal an area of 1 square inch, it only requires 84 of 1/8 inch diameter.

I believe most of the loss from scars can be traced to improper venting, also much of the loss from flat gates blowing and breaking down can be traced to the same cause ; not but what the molder uses his wire enough—in fact, he uses it far more than would be necessary with a properly made venting tool. In thin castings, no matter how large in area, you want quick action from your vent holes ; the air in the mold should begin to escape through them the moment the metal enters. Yet they should be so made that the metal cannot enter them, for if it does that ends their usefulness, nothing having escaped through them but the air in the sand, which is greatly expanded in volume by the heat, leaving the steam and the gases to escape through the sand as best they can, which is often badly, and the result is scars and blow holes. I hold that on thin castings the wire should touch the pattern, and stove molders, as a rule, follow this practice, though in some quarters the wisdom of it is questioned, owing to the liability of the metal to enter the vents. This happens when the molder begins to use a new wire cut off straight, which leaves a hole that the metal can easily enter. Later on, when this wire becomes worn to the size of a needle, neither metal nor anything else will enter the vents unless when venting at an angle the wire slips. But when it is worn down so small at the point, and the hole does not reach its maximum size until 2 inches from the pattern, it is impossible to get the quick action which is so desirable on thin castings.

Five minutes' work on a piece of steel wire and a vent wire can be made which will make the hole its maximum size 1-16 inch from the point. With this one can vent to the pattern with it without fear of the iron entering the hole, and if the metal is the right kind it will last a lifetime.

HOW TO MAKE A SMALL VENT WIRE.

I can hear the wiseacre, the shop oracle, the man who does not believe in learning a trade out of a book, and others of that ilk, if they see this chapter, repeat sneeringly the words in the title of it. Nevertheless, I believe that not more than one in five is made at all, and there are hundreds of foundries in which not one can be found that is made right.

The umbrella ribs mentioned are too small for vent wires anyhow, all I have measured being scant 5-64 inch diameter. Wire 3-32 inch diameter is small enough, requiring 145 holes to give an area equal to 1 square inch.

When you have the wire of right diameter and length and straightened, put it on the grindstone or emery wheel and grind it to a sharp point at an angle of 90 degrees. Be sure and get it even and the point very sharp. Go now where there is a small hot fire and heat the sharp end to a good red heat for about 1/8 inch, then plunge it into cold water and leave it there till cold. If it gets hot too far up the wire it is liable to break, but if you heat it quickly and have a good piece of steel the point of your wire will be nearly as hard as a diamond and will wear above the point first. One may vent to a pattern with this wire without any fear of the iron entering the vent, for the reason that the point is a true point, having no dimensions, whereas wires that are simply worn sharp by use and not hardened have about the same diameter at the extreme point that they have 1/8 inch from it. This is sure to be the case when they are used to vent to metal patterns. But even when not venting to the pattern, soft steel will never take a perfect point. If your wire is 1-16 inch diameter a 90-degree angle at the point will bring the maximum size of the vent holes within 1-32 inch of the pattern ; if 1/8 inch diameter, within 1-16 inch. In venting to a metal pattern at an angle with an untempered wire it is liable to slip, leaving a hole which the iron will enter instead of a vent hole; with a wire ground sharp and tempered hard this will never occur.

HANDLES FOR VENT WIRES.

I can never understand why molders go begging old file and screw driver handles from carpenters and machinists for vent wire handles, when they have a material at hand, in the iron they work, which is more easily attached to the wire, more durable and better from every point of view. It gives the tool weight and less exertion is required in venting through a body of hard rammed sand. If venting over a wood pattern and you want to strike it light or not at all, the weight of the tool gives more control over it and enables one to gauge more accurately the force of a blow, as with a very slight impluse at the start the combined momentum and force of gravity will drive a small wire to the pattern in a flask of ordinary depth.

Hardly any two molders handle their vent wire exactly alike. It is probable that this follows natural causes, as thick or slender, long or short fingers, or the strength and grasping power of the hand and fingers. A great many molders, even when they have a handle on their vent wire, never use it, but catch the wire below the handle between the thumb and forefinger. Many others place the forefinger on the end of the handle and the thumb on one side, and the second and third finger on the opposite side of the wire or handle. For all molders following either of these practices I would recommend an inverted cone of iron for a handle—that is, so the base or flat part would be uppermost when venting. It is a very convenient shape, and if an inch or 1¼ inch diameter at the base, when dropped, handle down, on any level or nearly level surface, as on the top of a finished mold, it will stand up straight, out of the way, yet within reach and easily located when needed again. To make a cone shaped iron handle get a piece of tin and cut it to the outline size of the cone you desire to make. A triangle with sides 1¼ or 1½ inches long will be right for a wire from 1-16 to 1/8 inch in diameter. Have a pile of sand deeper than your wire is long. Level off the top a little and, using the triangle for a sweep, cut out the shape of a cone. Bush the wire point down through the sand at the vertex of the cone until it is deep enough so that there will be 1/8 inch of metal to cover the end of it, pour a drop of not too hot metal into it and the handle is made. The whole operation should not take as long as the telling. Other shapes that can be made in this way are cylinders, squares and hemispheres. Still other shapes, as ovals and spheres or file and screw driver handles, can be molded in the usual way casting the wire in.

LARGE VENT WIRES.

Users of large vent wires are far in advance of those using small ones in adapting the tool to their needs by giving it a square pointed head with angles 25 to 30 degrees, and larger at the largest point of the head than the shank of the wire, thus eliminating friction except on the very limited surface of the head. Although vent rods with spear heads seemed to be an old institution 12 years ago, when the writer first started to work in a foundry, molders may yet be found using vent rods from 3-16 to 3/8 inch diameter, with no other preparation than to grind the rod to a point at an angle of 20 or 25 degrees. Within the last few months I have seen a molder of 30 years' experience, and the star of the shop, using a 5-16 inch rod ground off a little at the end. He had to force it through 20 inches of hard rammed sand about 60 times a day every day for several weeks at the time, and I have often seen him stop and hold up his arm as if in pain, at the same time complaining how tired it made his arm. The casting was a thin one of peculiar shape, so the mold had to be rammed pretty solid and required an unusual amount of venting. It weighed about 90 pounds, and was poured with very hot metal from three hand ladles in two or

hree seconds, hence the necessity for quick action from the vents. Although our molder was exerting himself to force a 5-16 inch rod through 15 or 20 inches of sand, after using it for awhile the first few inches wore down so that ½ inch from the point it was not half that diameter, and the hole would not be full size until 2 or 3 inches from the point. It would not be exaggerating to say that with a properly made vent rod more certain results could be obtained with 1-10 of the exertion.

All vent rods from 3-16 inch up should have spear heads. Steel is preferable. Get a piece the right length and diameter, put it in a fire and bring about 1½ or 2 inches of one end to a forging heat. Cool off about ½ inch at the extreme end, secure it in a vise, allowing 1½ or 2 inches to extend out, and strike it with a hammer until you see it is large enough. Heat it again and forge it with the hammer on the anvil to the desired shape. A circle presents the smallest surface inclosing a given area, hence a head in the form of a cone would offer the least resistance to entering the sand, but is difficult to control and direct. The same objection applies in a less degree to the triangular head, a shape often seen in use.

Actual experience has demonstrated that for general utility the best shape is a four sided pyramid twice as long from base to vertex as the diameter of the rod. The length of each side of the base should be a shade more than the diameter of the rod to insure freedom from friction except on the head. Take a tempering heat on the head, plunge it into cold water, and the rod is made except the handle. The whole operation will not take more than 15 minutes. Medium sized vent rods that can be handled with one hand have woodeu knobs for handles. Larger ones requiring the use of both hands when used for straight venting have wooden haudles about the size and shape of old fashioned auger handles. All of the arguments in favor of metal handles for small vent wires apply with more force to large and medium size vent rods. For oue hand vent rods a very convenient shape is the sphere with the rod cast into it, patterns for any size being easily obtained. Another very convenient shape is that of the common door knob.

Heating and Ventilating the House Properly.

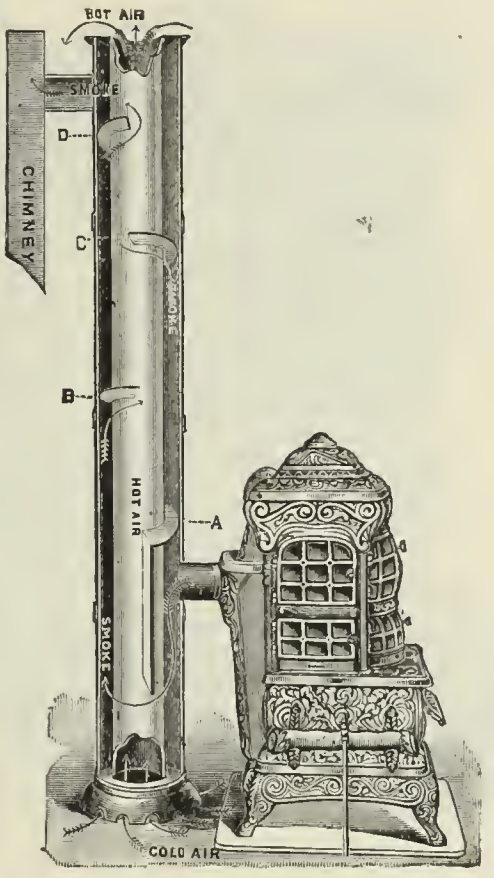
The proper heating and ventilation of the house, says a writer in a St. Paul paper, is one of the matters which at this season trequently comes up for discussion. One must have plenty of fresh, pure air to have good health, and this is what many women do not get through the winter, because they are shut up in houses not well ventilated. Few city houses are supplied with facilities for perfect ventilation. According to late day science on this question every room in every house should have a ventilator either at the ceiling or at the floor, or both. In a recent house where a good deal of attention has been given to the ventilation there is a small ventilator near the ceiling and one in the base board of each room. The latter is connected with a pipe which goes to the kitchen chimney. This method is considered a good one, because the heat of the chimney creates a continuous current, thus drawing out the stagnant air at the floor, and when the hot air register is open the ceiling one needs only to be slightly open to secure excellent ventilation.

City architects and builders do not as a rule give much thought to the matter, so that housewives who have studied the subject and learned the importance of a healthful home atmosphere find themselves confronted with several practical problems. In the first place, eveu in the newest houses the furnace draws its cold air supply from the cellar. This can be obviated by the building of a cold air box, which will not cost over $18 or $20. "But my cellar is clean, so what harm can there be even if the furnace is fed from the cellar air?" asks the housewife, who has given little heed to the matter. A cellar may be kept comparatively clean and yet the walls will get damp and moldy, as will all underground places. Of course the sanitary condition of the air in a perfectly clean cellar is much better than that in one where there are decaying vegetables and accumulations of rubbish, and yet the air feeding the furnace should come from outside, as a moldy condition of the cellar generates disease germs, and modern science shows that heat does not kill the most dangerous of these, but rather raises them to life to be thrown into the living rooms from the hot air registers.

"What simple precautions can be taken by the householder when no provision has been made for ventilation by means of modern facilities?" is the question which bears most directly on this matter every season when the fires are started. One of the simplest schemes yet devised is to raise the window and put in the open space a fitted strip of board, so that when the window is closed down upon it about 1 inch will be left open between the two sashes. The fitted board prevents a draft and yet affords an entrance for fresh air between the sashes. The only makeshift where even this simple arrangement is not provided is to lower the window slightly from the top. When heat is first turned into a cold room the windows should be lowered from the top to provide a circulation and to let out the cold, stagnant air, which otherwise has no escape, and against which the warm air makes slow headway.

The Waste Heat Radiator.

The waste heat radiator is a device of interest to the stove and furnace trade, which is manufactured and placed on the market by the Waste Heat Radiator Compauy, Buffalo, N. Y. The accompanying illustration shows it attached to a heating stove, but a similar application is made to a hot air furnace or to a steam or hot water boiler. In the latter cases the radiator is placed in the cellar, and the air is either taken from the cellar cold air box or through a pipe from an opening in the room above. After being heated it is taken from the top of the



The Waste Heat Radiator.

tube through a register into the same room, giving a circulation of air.

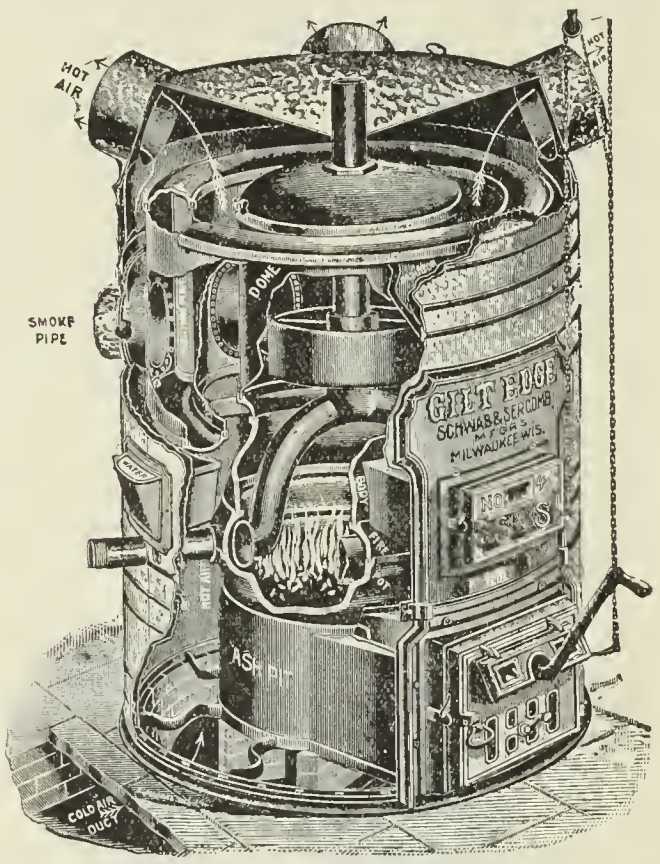
Referring to the illustration presented herewith, it will be seen that the device consists of a double cylinder supported from the floor by a perforated plate. The cool air is taken in as shown by the arrows at the bottom, passes through the central tube, and after being heated in its passage escapes into the upper part of the room. The pipe from the stove opens between the two cylinders, and the smoke rises in a spiral course around the inner tube, finally entering the chimney through the smoke pipe above, as shown. The smoke and hot gases are kept from escaping direct to the chimney by means of baffle plates, and by this means the heat is extracted from the products of combustion and prevented from wasting into the chimney. The manufacturers claim that by the use of this radiator a great saving of coal is effected. They also point out that it takes the cold air from the floor, and as the cold air is drawn in the hot air on the ceiling comes down to take its place, thus securing a continuous circulation of air in the room. The radiating surface of the radiator is given as about 40 square feet. The device is very readily attached to a stove and can, it is stated, be put in place in 15 minutes and while the fire is burning.

Joseph Huse & Son, 95 Blackstone street, Boston, Mass., are busy this season with the demand for Stove Re-

pairs and are also doing a good trade in Mica. Their 2-pound packages of eight sizes of Mica give a useful assortment in a convenient case which the trade will appreciate.

The Gilt Edge Combination Warm Air and Hot Water Heater.

In the accompanying illustration we show the new combination warm air and hot water heater manufactured under the name Gilt Edge by Schwab & Sercomb, Milwaukee, Wis., and E. E. Dunning, manager of their furnace department, says that he is particularly pleased with the favorable reception accorded this heater by the trade. As will be seen from the cut, the heater is provided with a deep ash pit, a labor saving grate and a space through which the fire may be readily cleaned. The fire pot is of the sectional type. The space of the upper section of the fire pot is utilized for a water heating ring, which is a hollow casting, high and narrow, containing the water in a thin sheet, which by the construction is made to circulate around its entire circumference, and as the ring extends outwardly it does not decrease the size of the fire pot. The water ring is incased in an iron casing made in two sections, with gas tight joints. There is a space between the water ring and this casing, so that all parts of the surface of the water ring are exposed to the action of the fire, and the water heater by this construction is not



The Gilt Edge Combination Warm Air and Hot Water Heater

exposed to the chilling effect of the cold air passing through the furnace to be heated. The water ring is tapped for a return at each side, the connections being made so as to secure a gas and dust tight joint. Pipes of large diameter are cast on the water heating ring at different places and extend upward in an arch shape to the center of the furnace, where the flow pipe connection carrying the hot water through the top of the heater is made. In case of increased heating capacity being necessary an additional section is connected to the water heater at the top of the arch. These sections consist of hollow rings which are thin and high, so as to present a large amount of fire surface and to make them as nearly self cleaning as possible. The furnaces are furnished with one flow pipe and two return pipe connections. The construction is such that the water on entering the lower water sections must travel horizontally for a considerable distance before it strikes one of the arching arms to pass upward, by this means insuring its contact with a considerable amount of fire surface and a thorough heating. The construction of the furnace is of a central dome type, with a smoke drum surrounding it so as to form two distinct air chambers in the furnace. One is centrally located, where its surfaces are affected by the direct radiation from the fire and the hot gases, and the other chamber is between the outer radiator and the casing of the furnace. The fire travel is governed by a damper and can be made direct or indirect, as desired. The furnace is provided with chain attachments for draft regulation. This heater, which is made in several sizes, is presented as first class in construction and efficiency, and correspondence is solicited in reference to it.

The Richmond Stove Company.

An exceedingly attractive stove catalogue of 64 pages, relating to their various lines of Richmond stoves, ranges and furnaces, has just been issued from the press by the Richmond Stove Company, with general offices and works at Norwich, Conn. The printing is in black upon calendared paper and the binding is in colored covers carrying upon the front in script type the word "Richmond." This appears diagonally on the page and is printed in deep red, the letters being bordered in black. The fourth page of the cover is embellished with a *fac-simile* of the company's trade-mark. In the line of ranges there are several additions to the company's assortment, Series 1, 2 and 3 being especially attractive in their external adornment. This line of Richmond ranges, it is said, represents the "fruit of years of earnest thought and practical experience." Reference is made to the complete appointments, durability, thorough workmanship and economy of operation of these goods, and special attention is called to the spacious oven, which is full size top and bottom; to the fire box of unusual capacity and to the powerful water front. In the oven door is placed a thermometer, which indicates accurately the temperature of the oven and which will be found a valuable aid in baking. The grate employed is the well-known Richmond, and the other features embodied are of a character to interest both the dealer and the consumer. The catalogue shows some of the many styles in which this range is offered, as well as many other patterns made under the same name. Among the heaters attention is first given to Series 312-316 of the Richmond surface burner, with cast flue box in the rear and with ascending and descending flues passing around the base. After this we find illustrations of Series 213-217 and Series 111-115 of the Richmond sheet iron surface burners. Richmond furnaces occupy the concluding pages, these consisting of Series 210-300 and Series 718 730 and Series 818-830. There is also shown the Richmond hot air and hot water combination heater.

The White-Warner Company,

Taunton, Mass., are enjoying an excellent demand for their Household ranges, are working full time and are not piling up stock. The prosperity of the concern is seen in the additions recently completed and in process of construction. The office building at one corner of the works, which has been finished but a short time, gives light and airy office quarters. They are now working on a sand house, have lately finished a pattern storage house and will shortly begin work on a further addition to meet the demand for space on account of the line of Household hot air furnaces which they have brought out this season, and which are meeting with favorable reception from the trade. In connection with this heater they are making a combination heater for hot water, using the Household with water sections around the fire pot, one or more according to the amount of water radiation demanded. H. A. Tinkham, who has had an extensive experience in furnace construction and selling, is now interested with the White-Warner Company as general manager and has brought his wide experience to bear in designing the Household heater, which has many features that will win the attention of the trade.

Tests of Coal.

The Marion Stove Company, Marion, Ind., issue a circular relating to the Special Retort Oak, a construction recently illustrated in the columns of *The Metal Worker*. In the circular they present a report of tests of different fuels made with this stove by Frank J. Gould. Sixteen tests were made in all, of six days each, covering a period from October 22, 1896, to February 22, 1897, the fuels used being hard coal, Jackson soft coal, Frick's 72-hour coke, Pittsburgh soft coal, green hickory wood, mixed Jackson and Pittsburgh soft coal, wet Illinois slack, Frick's coke and Pittsburgh coal, Pittsburgh coal and coke and Hocking coal. The tests were made in the office of the Marion Stove Company, a building 14 x 24 x 10 feet, containing 3360 cubic feet, the office being a detached building with five windows and one door. The stove used was a No. 16 Special Retort Oak, and fired so as to keep the inside air at a comfortable working temperature. We give below the result of the tests as summarized by Mr. Gould.

It will be seen that I used

534 pounds hard coal in 15 days, or 35 3-5 pounds per day, costing about 12 cents per day.

2034 pounds soft coal in 47 days, or 43¼ pounds per day, costing about 7 cents per day.

622 pounds Illinois slack in 16 days, or 38⅞ pounds per day, costing about 4 cents per day.

1365 pounds coke (Frick's 72-hour) in 37 days, or 36 8-9 pounds per day, costing about 8 cents per day.

435 pounds hickory wood in eight days, or 54⅜ pounds per day, costing about 6 cents per day.

In detail it will be seen that the hard coal covered but two tests with an average temperature of 40.5.

The soft coal covered seven tests with an average temperature of 34 4-7.

The Illinois slack covered two tests with an average temperature of 33 3-10.

The coke covered five tests with an average temperature of 28.

The wood covered one test with an average temperature of 40.2.

The above shows that while the hard coal used 35 3-5 ponnds per day it was done on the highest temperature, 40.5.

The soft coal shows 43¼ pounds on a temperature 34 4-7 degrees, but the soft coal extended over so much more time that it was affected more than any other fuel by the action of the wind. I discovered early that the wind pressure affected the consumption of fuels materially ; this was especially marked in the test of hickory wood, during the last three days of which the worst blizzard of the season raged. Taken as a whole, the tests show that there is little or no difference in any of the solid fnels, except in the price. If any one of the fuels has any advantage, Frick's 72-hour foundry coke has it, but this is a fuel difficult to manage by inexperienced persons and is used but little at present ; 48-hour crushed coke is easier managed and no doubt would be a desirable fuel.

THE STOVE TRADE IN CHICAGO.

The Chicago stove trade is reported steady on a moderate volume of businses Manufacturers are quite confident that the end of the season will find them with stocks pretty generally cleaned up. They began with small stocks in their warehouses. and the good movement in August pulled them down very sharply. If September and October had followed on the same lines, as was naturally expected, quite a scarcity would have developed by this time. But the abnormally warm weather caused a shrinkage in sales which leaves the supply of stoves in first hands fairly good. They are not excessive, however, because the demand was not cut off entirely as it was last year. Trade this year, instead of being adversely influenced by financial considerations, is regarded as being almost wholly under the influence of the weather. Phenomenally mild weather still prevails in the West and Northwest. Cold snaps have made their appearance from time to time in the past five or six weeks, but their duration was measured by hours rather than days as in every previous year for which records have been kept. This dependence on the weather causes stove men to hope that early in the present month a change may occur to something like sharp winter weather. But it must come soon to have a favorable effect on this season's trade.

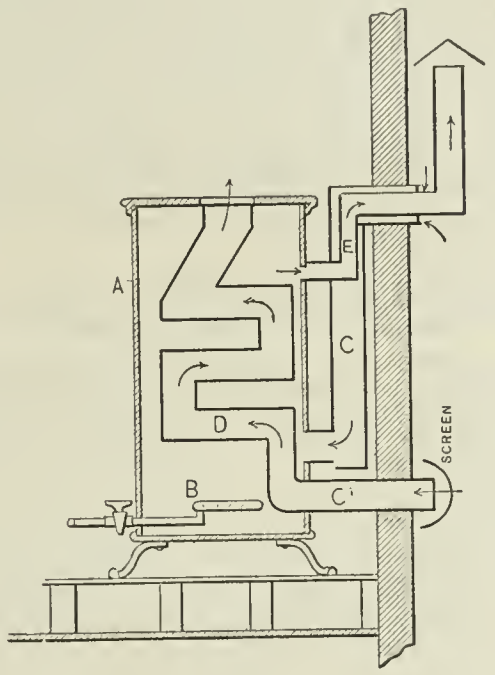
Hygienic Gas Stoves.

It will be admitted by every one, says a writer in *Ironmongery*, whether an expert in sanitary matters or not, that a gas stove, whatever its name or claims may be, cannot be considered hygienic if it does not fulfill the following conditions :

1. No fumes must be allowed to escape into the room.
2. An efficient escape pipe for such fumes must be provided.
3. In the case of sleeping rooms, air for maintaining combustion should not be taken from the room itself, but be admitted from the outside.
4. The warmed air should be also pure, and admitted freely from the open air, and passed over the heated surfaces, a constant circulation to be kept up by an independent outlet to open air or chimney with a good up-draft.

Such a stove, fitted to a bedroom or nursery, would be absolutely safe and healthy, as the condition of the air for the purpose of respiration is not deteriorated by previous use, and combustion is carried on independently. In many cases, however, all these conditions cannot be obtained except at great expense, and many sleeping rooms are so situated that direct communication with the open air is impossible, as in the case of basements underground, where thousands of sleeping apartments are to be found. In such cases a gas stove would be the worst form of heating arrangement, unless a chimney is available to carry off the products of combustion. There are many rooms, however, having no chimney, but so situated that access to the open air is available. In such cases a good gas stove is a safe means of obtaining comfort without the risk of endangering health.

To those in the ironmongery and kindred trades who are called upon to advise their clients in the matter of selection, I recommend an inspection of the room before advising, and next find a suitable stove. In this article, I wish to call attention to a type of stove that is, in my opinion, the best stove for a bedroom, as it fulfills all the conditions I have mentioned, and acts quite as well without a chimney to assist it. The cut shows in section all the essential details. A is a case of sheet metal entirely inclosing all the apparatus ; B is a gas burner of a few jets, either atmospheric or open burner ; C is a tube for conveying fresh air from outside the house to the gas burner, for the purpose of combustion only ; C^1 is a larger tube, which conveys air to the zigzag chamber D. The tube E is also carried to the open air, and either extended some length in a vertical direction, or fitted with a wind guard cap when it emerges from the wall ; this carries off the products of combustion. Its action is simple and is easily seen from the diagram. On lighting the gas, for which a small air tight door is provided, the zigzag tube becomes heated, the column of air inside at once commences to ascend, drawing in the fresh air through C^1; the pumping action increases till the tube acquires its normal temperature, regulated by the heat from the gas. A steady stream of fresh warmed air is sent into the room, without in any way extracting air from the room itself, and as this is discharged into the room at about the level of an ordinary bed the sleeper obtains it readily, and the only additional



Hygienic Gas Stoves.

apparatus necessary is a means of taking off the vitiated air, which may be done by a grating near the ceiling in the outer wall or into a passage.

ODD PLATES.

An oil painting was exhibited in the show window of the Ringen Stove Company's store in St. Louis, during fair week of this year, representing Vesta, the Goddess of Hearth, Household and Family, in the act of placing the laurel wreath of merit on the Quick Meal Gasoline Stove and the palm branch on the Quick Meal Steel Range, both of which are manufactured by the Ringen Stove Company. The picture measures 6 x 6 feet, and attracted marked attention during the time it was on exhibition; in fact, the company were so besieged with inquiries regarding it that they have had printed several thousand half-tone reproductions and are now sending them out to the trade. The picture is inclosed in a handsome gilt frame and occupies a conspicuous position in the store of the Ringen Stove Company, where it continues to attract a large number of visitors daily. At the display of the Ringen Stove in the Exposition Building, St. Louis, this company used an enlarged reproduction of this picture, measuring 30 feet square. This was placed at one end of the gallery, and by using a number of arc lights the picture was shown to great advantage to the vast throngs which visited the exposition in the evenings.

The Weir Stove Company, Taunton, Mass., are busily occupied in all departments. The company report an excellent demand for their Glenwood line of Stoves and Furnaces, and are at work on a Hot Water Heater, to the construction of which they are giving great care and are submitting it to thorough practical test before putting it on the market. The company pride themselves on the excellence of their foundry work and the fine results obtained are, in a measure, due to the extreme care taken in the inspection of castings, all plates having the slightest defects being thrown in the scrap heap. In fact, the majority of the plates discarded would seem perfect to the ordinary observer, and only a most scrupulous

inspection will discover the cause of their being thrown out.

The N. E. White Company, 21-25 Catherine street, Utica, N. Y., who were burned out September 28, state that they can promptly make shipments of Banner Stove Lining which they manufacture. In their advertisement this week they make the significant announcement that "you cannot burn out Banner Stove Lining," and they further give particulars of prices and quantities that will interest the trade. A number of extracts from testimonial letters tell what the users think of the Lining.

The G. S. Blodgett Company, Burlington, Vt., have recent shipped several of their Patent Portable Baking Ovens to Cairo, Egypt, for use on the Nile steamers. This is the second order from this place, a former lot having been in use a year and proved well suited to the work.

Schill Brothers, manufacturers of Furnaces and Steel Ranges, Crestline, Ohio, report that business with them was never so good as at present; in fact, they are snowed under with orders and scarcely know how to keep up.

The Henry N. Clark Company, 103-105 Blackstone street, Boston, Mass., have done and are doing a most satisfactory business in the Novelty Blue Flame Oil Stove made by the Novelty Mfg. Company, Jackson, Mich., for whom they are the New England agents. Their trade this year has been so large that they have been compelled to increase their orders from the manufacturers to meet the growing demand. Messrs. Clark Company, who for some years have had only a part of the Eastern district, are now agents for the entire New England territory, and besides the Blue Flame Oil Stoves are agents for the Aluminum Oil Stoves and the whole extensive line of goods made by the Novelty Mfg. Company.

M. Gensmer & Son, Caledonia, Minn., have the contract for heating the store of Tuos & Co. and F. Collins & Co., using No. 16 Brand's Famous Magnet Furnaces.

The Smokeless Fuel Saving Stove Company of New York City have been incorporated; capital, $100,000; directors, William D. Goodwin, H. L. Bridges, W. W. Gage, Herman Schmidt, Frederick Girtanner, Morris Sternfield and Samuel D. Sewards.

The Rutland Fire Clay Company of Rutland, Vt., have issued a price-list which they request the recipient to preserve for future reference. The prices cover Rutland Stove Linings, Stove Polish, Vermont Polishing Mittens and Black Imp Dealers' Polish. The company are also sending out cards calling attention to their Stove Lining, which they state is the result of 15 years' experience and careful attention to what constitutes the requirements of a good plastic Stove Lining.

A. Weiskittel & Son, Baltimore, Md., have issued a supplementary catalogue, setting forth the merits of the Patapsco Ranges, which they state have been greatly improved in every way. The Patapsco is a richly decorated Stove with large six-hole top, swell oven door, extra heavy double covers and all parts reinforced in such a way as to render them very durable. The interior construction remains practically the same as heretofore, but the Range has a new dress in which rich carving constitutes an important factor. The Range is made in three sizes and several modifications. In connection with the Range are shown engravings of a fancy high shelf and high closet, also of the No. 10 Fire King Oil Heater. A few testimonials are given bearing witness to the favor in which the Patapsco Range is held by the trade.

Janes & Kirtland, 110-116 Beekman street, New York City, have added to their line a new Beebe Range, which is adapted to the requirements of the modern builder. They are made with ovens of different sizes and with different sizes of cooking holes on the top. They are furnished with feet, with a hot closet, with warming shelf, and with a water back for vertical boiler or with brackets for supporting a horizontal boiler either exposed or incased. Circulars giving prices and cuts of the Range can be secured on application. They have also added to their Beebe line of Furnaces a series of Furnaces with steel radiators, which include two small sizes with 28 and 32 inch casings and run up to the large sizes, the largest of which has a 52-inch casing, the smallest sized fire pot being 16 inches in diameter. Their circulars show the Furnace with a labor saving grate and a dust flue for carrying off fine ashes. The circular also gives various dimensions and prices of the Furnaces.

John P. Ley, manager of the New York house of Charles Noble & Co., Philadelphia, has arranged his show window at 239 Water street very attractively. Their Home Liberty, a Range for builders, with horizontal boiler, occupies one side and a Sam Fire Place Heater the other. Placed so as not to obscure these are a Liberty Oak, two Game Oil Stoves and a Liberty Square Parlor Heater. The Oil Stoves have a large illumination, and when lighted in the late afternoon produce a fine effect that can be imitated by the Stove dealer with benefit.

The Bonnet-Nance Stove Company, Quincy, Ill., have issued the following notice to the trade under date of October 29: "We regret to inform our customers and friends that a large portion of our works was destroyed by fire on the night of the 27th inst., and, while it is our intention to rebuild and get under way again as soon as possible, that there will be a delay of perhaps 60 days before we will be able to fill orders." The local papers state that the loss is $100,000 and insurance $60,000. The works were running full force, with numerous orders to fill, and a stock of about 8000 Stoves in the warehouse, which were broken or partly melted and thus damaged beyond hope of salvage The company have the sympathy of the trade in their misfortune. They have been long established in the Western Stove trade and are as highly regarded as they are well known.

The Michigan Stove Company are aggressive in their position against department stores. They are distributing throughout the trade one of their boiler plate postal cards, this time of a deep blue color, which attacks department stores, defends the retail merchants who confine themselves to one legitimate line of goods and suggests how retail merchants can effectively look after their own interests. In this line of thought the natural conclusion presented is that retail merchants should give their encouragement and co-operation to those manufacturers who have persistently refused to sell to department stores.

The M. & D. Range Company, 7700 to 7740 South Chicago avenue, Chicago, have enjoyed a specially good demand this season for their combination Gas and Coal Range. A Range of this character supplies a want in a dwelling house which the housekeeper desires well furnished and is therefore not disposed to stint the investment in the kitchen. The managers of the company have been very greatly pleased with their trade in this specialty, which does not seek favor through its low price. The business thus done is an indication of a better feeling among the people generally, of more remunerative employment and of a much easier financial condition. The demand for other high class cooking goods has also been considerably better than last year, although the company's facilities would enable them to easily handle a larger trade. They manufacture nothing but cooking goods, aiming to make their mark in this line alone.

Fletcher, Russell & Co., Limited, of Warrington, England, send us a copy of the first and second sections of their catalogue covering cooking and heating appliances for using gas as a fuel. Accompanying the catalogue is a little pamphlet illustrating the company's New Fireglow Stoves, which are referred to as "unique in design and attractive in appearance." They are something on the order of an open Franklin, although the designs vary to meet different requirements. When the Stoves are in use they present the appearance of a brilliant incandescent fire, although the manufacturers state that this effect is not produced by the use of colored glass, but by an arrangement which is fully patented The claim is made that the Stoves are well adapted for shops, entrance halls, &c., where it is difficult to use an open fire satisfactorily. Nearly all patterns made with flues, it is stated, can be adapted to the patent Fireglow arrangement if the flue is left open to the room. Like all other flueless Stoves, however, the manufacturers do not recommend this arrangement for badly ventilated rooms with low ceilings, or for small sitting rooms, as the absence of a flue produces a close feeling in small rooms whatever make of Stove is used. Neither are they recommended for school rooms, where "free circulation is of more importance than warmth," but rather for lofty reception rooms, restaurants, offices, &c. The Stoves are offered under such names as the Congo Fireglow, the Hall Fireglow, Oval Fireglow, Ruby Square, Tubular Fireglow and Brazier Fireglow.

"Artistic Furnishings for Fire Places in Brass, Wrought Iron and Cast Iron" is the title of a very attractive pamphlet which is being distributed among the trade by the S M. Howes Company, 40-46 Union street, Boston, Mass. The goods shown include Portable Basket Grates on casters, with dump centers; Portable Chair Grates; brass, wrought iron and cast Andirons; brass Fire Sets, cast Fire Sets, brass Fenders, Coal Hods, Folding Screens, Spark Guards, Bellows, Gas Logs, Ash Pit Doors, Boiler Doors, Boiler Grates and Fire Place Dampers. The pamphlet is printed on a good quality of paper and is bound in colored paper covers, with a red silken cord tied through the upper rear corner for the purpose of hanging the publication within convenient reach for reference.

Southard, Robertson & Co., 23 Peck slip, New York, have much to interest the Stove dealer in their sample room. The goods that are moving liveliest at present are the new Magnetic X Ray and the Savoy Ranges. For the winter trade their Flag Cylinder Stoves and Columbus Square Parlor Heaters have many attractions. The Madison Square and the Plaza are more handsome and qualified for leaders where high grade goods are desired.

TRADE REPORT.

METAL MARKET.

Pig Tin.—There has been about the usual distribution of Pig Tin, chiefly against current wants, but large deals were quite the exception. Wholesale prices have ruled fairly firm, however, while jobbers' prices are unchanged. Small lots of Straits Pig from store are generally quoted at 14¾c. per lb.

Copper.—The market has remained in somewhat dull condition and the undertone is somewhat weak, particularly for Lake Superior Ingot. The demand for all varieties is slow and values in the wholesale market seem to be irregular. Retail business has been of moderate proportions. In small parcels from store Lake Ingot is quoted at 12c. to 12¼c. per lb. and Ansonia Grade Casting Copper at 11c. to 11¼c.

Sheet Copper.—There is no change in the condition of this material from that reported for the past few weeks. The demand is irregular and orders received are mainly for current requirements. The volume of business is little if any better than last season. Manufacturers, however, look for improvement, both in the amount of business and in values, after the turn of the year. At the present time the usual quotation for moderate sized lots of Sheet Copper from stock is about 15c. per lb., basis.

Pig Lead.—Comparatively little business has been effected during the week, but the market showed rather firmer tone, and offerings were more reserved than for the past few weeks. Jobbers' prices are unchanged, small lots of American Pig being quoted at 4.35c. to 4½c. per lb.

St. Louis advices are as follows : The market for Pig Lead is a waiting one, both buyers and sellers appearing uncertain what move to make. The situation is a trifle mixed, although with light stocks in the hands of both producers and consumers the chance for an early advance seems favorable.

Lead Pipe and Sheet.—Nothing but the most ordinary type of demand is noted. Consumers are taking merely enough material to supply their current needs and these are of a limited character. The recent reduction in prices of Pipe and Sheet does not seem to have led to any expansion of orders. Eastern manufacturers and dealers quote Lead Pipe at 6c. and Sheet at 7c. per lb., subject to the customary discount.

Spelter.—The market has remained very quiet and there is no feature of interest aside from the general report that prices are fairly well maintained despite the dull condition of the market. The consumptive demand remains very moderate and retail prices show no variation. Small lots of good Western brands are quoted here at 4.65c. to 4¾c. per lb.

St. Louis advices are as follows : There is absolutely no change to note in this metal. The prediction made in this report several weeks since that 4.10c. would be maintained during the balance of the year seems in a fair way to be verified. Producers claim they are satisfied with this price, as it enables them to manufacture with a fair margin of profit, and consumers prefer a steady price to an up and down market, so that there appears to be general satisfaction all around. The demand is not heavy, but there is no accumulation of stock in either producers' or consumers' hands.

Sheet Zinc.—The consumptive demand is of the ordinary routine nature which has characterized this material for many months past. Prices are unchanged. Jobbers quote 600 lb. cask lots at 5⅝c. to 5¾c. per lb. and smaller quantities at 6⅛c. to 6¼c.

Antimony.—A very fair distribution has been going on in a jobbing way and prices remain steady on the basis of 8¼c. to 8½c. for Cookson's, 7¾c. for Hallett's and 7⅛c. to 7¼c. for Japanese in retail quantities.

Nickel.—Sellers are quoting 36c. to 38c. for small quantities.

Aluminum.—A fairly large volume of orders is reported for this metal in its various forms. Present prices are as follows : No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb., 100 lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb., 100 lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb., 100 lb. lots, 30c.

Tin Plate.—There is little of interest to note in connection with this market. While a few good sized orders for American Cokes for extended deliveries are understood to have been placed with the mills during the week, the general run of business has been very quiet and prices remain without important change. The delay in deliveries by the mills is still an important feature of the situation. Spot stocks are admittedly small, and available Plates are readily absorbed, notwithstanding the somewhat limited demand. These factors, which are likely to remain as such for the balance of the year, tend to stiffen the dull market. Makers are offering freely for distant future shipments, but most of the mills are believed to be well booked up for the next three or four months. Quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows : American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60 ; do., 100 lbs., $3.40 to $3.50 ; do , 95 lbs., $3.35 to $3.45 ; do., 90 lbs., $3.30 to $3.40 ; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75 ; Allaway grade, IC, 14 x 20, $4.25 ; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates remain very quiet and prices are largely nominal.

Chicago advices are as follows : The Tin Plate market is quiet, with some inquiries for next year. Manufacturers state that domestic makes now control the Pacific Coast trade with the mere exception of Tin Plates intended for export packages.

A special London cable dispatch of November 3, 1897, reports on the British Tin Plate market as follows : Tin Plate steady for prompt delivery and more active for forward, but large business possible only at lower prices. Several works shut down owing to a portion of workmen refusing to accept the lower wages scale. Stocks at Swansea docks have increased to 134,000 boxes.

Sheet Iron.—The demand for thin Sheets continues active, but there is still considerable difficulty in getting prompt shipments. Mills which are able to make quick deliveries are asking and getting the outside prices. A number of consumers have come into the market recently for additional supplies, and the movement of both Black and Galvanized Sheets is quite heavy all told. While mills are generally holding to the prices recently agreed upon, some jobbers are quoting below them. Jobbers' prices in this section for small quantities are quoted at 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron and 75 and 10 and 5 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows : Almost all the mills are far behind in deliveries on Black Sheets. Colder weather in the Northwest is causing urgent appeals for prompt shipment. All manufacturers are taking larger quantities than had at first been estimated. The situation is not so good, however, on Galvanized Sheets. Small lots from stock are selling at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—A fairly good local business is being done in all lines of Scrap metals The demand for Old Brass and Copper for export has been rather heavy and has tended to keep up prices for those materials. Scrap Brass is about ½c. per lb. higher. Large shipments were made during the week to Liverpool, England, and Genoa, Italy. Scrap Zinc is also in good demand abroad. The demand for Scrap Iron is somewhat irregular, but prices remain firm, as a whole. Dealers in this city and vicinity pay about the following rates for moderate sized lots, delivered here :

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3 c.
Zinc	per lb. 2½c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.50
Heavy Cast Scrap, per gross ton	9.50
Stove Plate Scrap, per gross ton	5.50
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

THE IRON MARKET.

While the furnaces and rolling mills in the leading producing sections are still crowded with work, and are even finding prompt delivery a troublesome matter, it is a fact that many producers are beginning to show some concern as to future employment. The confidence in a prosperous year for 1898 has not abated, but the usual winter interregnum of a slackening demand is the *bête noire*. Sellers are a shade more eager, while buyers show a little more disposition to await developments. As a matter of fact, both are maneuvering for position for next year, with the chances somewhat in favor of the latter, so far as the first quarter is concerned.

As representing the consumptive demand, the volume of business in Finished Iron and Steel continues good. While Bars in the Valleys remain steady, with a large tonnage booked, works further West are not quite so well off.

The market for Southern Pig Iron is a shade easier. Much has been made of the sales of warrants at concessions. As a matter of fact, warrants must naturally sell 35c. to 50c. below the market for Pig Iron, first because warrants must be paid for spot cash, even though it takes several weeks to obtain the actual Iron. Then the warrants call for 2240 pounds and not for 2268 pounds, which is the usual Southern shipping weight.

Pig Iron.—In the New York market, the demand has been light and some indications of shading in prices are developing. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

The Philadelphia Pig Iron market is a little quiet and intimations are given in some quarters that prices are not so well sustained as they were during the earlier portion of last month. Leading concerns do not attach much importance to these statements, however, as they all agree in saying that deliveries are well taken and that scarcity is more frequently met with than oversupplies. Sales during the past week have been chiefly in small lots at quoted rates, large orders being held in abeyance pending further developments as to general conditions. General quotations for seaboard deliveries are about as follows, with the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.50; No. 2 X Foundry, $11.25 to $11.75; No. 2 Plain, $10.75 to $11.

Local Pig Iron producers in the Chicago district report a moderate business, which, however, includes a few good orders. Inquiries are not so numerous as they were, and producers would not be disappointed if new business for the remainder of the year should prove light. Shipments are very heavy on old contracts, Iron going out from furnaces about as fast as it is made. Southern sales agents report a very light trade with few inquiries. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

In Pittsburgh, the week has been an active one in sales of Pig Iron, close to 75,000 tons of Bessemer having changed hands. These heavy sales, however, have not strengthened prices, which are only fairly strong. Foundry Irons are very dull in the Pittsburgh district, but are reported to be in better demand elsewhere. For balance of the year delivery we quote as follows, f.o.b. Pittsburgh: No. 1 Foundry, $11 to $11.25; No. 2, $10.50 to $10.75; No. 3, $10 to $10.25; Bessemer, $10.30 to $10.40.

There has been little change in the Cincinnati Pig Iron market While the tonnage of Southern brands sold by the furnaces has been small and confined in the main to small lots, there has been fair sprinkling of warrant Iron disposed of. The amount of this speculative stock, while not seriously heavy, is just enough to cause what irregularity is in sight, as it is being quoted pretty generally at 50c. or more less than maximum furnace askings. The furnaces themselves are very firm in their stand and not many of them are willing to entertain propositions for any less than maximum quotations. But little Iron is being sold; deliveries are heavy and not up to the demand. Production is not expanding, either in the South or the North. These factors are causing some agents to expect another heavy buying movement before January 1. The general outlook is regarded as excellent. Prices, in the absence of an active inquiry, may be regarded as unchanged. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

In St. Louis the demand is only fair and consumers have nearly all supplied their immediate requirements and are not in the market to replenish their stocks at this time. Furnace agents are refusing to shade prices, and the fact that the furnaces as a rule are well supplied with orders makes them particularly independent in this direction. The trade during the balance of the year, it is thought, is not likely to be heavy, as consumers will allow their stocks to run down until after the annual inventories are taken. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—The movement continues fair, but the demand is not quite so active as last week. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	4.00	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c.	2.50	....
Old Boilers—whole (Iron)	4.00	....
Old Boilers (Iron)—cut in single Sheets and Rings	7.00	....
Old Gas Pipe and Boiler Tubes	6.00	....
Cast Borings	3.50	....

Anthracite.—Coal merchants are disappointed this season. Cold snaps only last a few hours. Mild weather is the rule. Consequently coal is in very light demand. Prices are weak. The card on carload lots of 12 tons minimum is now as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Cheyenne, Wyo.	7.50
All points between Denver and Missouri River	7.00

The Bethlehem Iron Company, South Bethlehem, Pa., shipped last week to Newport News, Va., ten side armor plates, weighing 276 tons, for use on the new battle ship "Kentucky."

Corporation Counsel Thornton of Chicago, backed by Mayor Harrison of that city, has begun in the courts a fight on the department stores under the provision of city ordinances recently passed.

THE HARDWARE TRADE.

The business of October was somewhat disappointing, there not having been the increase in volume which was expected. The aggregate is, however, referred to as having been on the whole fairly satisfactory. The trade had, apparently, covered their immediate wants by their earlier orders, and were waiting to work off goods on hand before making further purchases. The condition of things in the South has interfered to a considerable extent with business in that section. The coming of cold weather will undoubtedly have a beneficial effect, and will stimulate in all parts of the country the demand for winter goods. There are few changes in price to note. The high prices developed for Wire Nails under the very active demand which has until recently prevailed show indications of a slight weakening, but in most other lines prices are steadily maintained, and the tone of the market is about as it has been. Some leading goods continue very low under stress of competition and as a result of the fact that the capacity of the mills for producing them is largely in excess of the demand for consumption. A very encouraging feature of the situation is the large amount of goods going abroad, the number and kind constantly increasing. Manufacturers are recognizing more and more the importance of this class of trade, which not only furnishes an outlet for goods which cannot be readily taken up in the home market, but opens wide and promising fields for permanent occupation in which a great amount of goods may be regularly disposed of.

Advices from Chicago.—The volume of business in Shelf Hardware is about the same as in the last half of October. The falling off since high tide in September has not been continuous, and the present even character of business is expected to continue until well toward the end of the year. It may be modified by occasional spurts in the demand for seasonable goods as cold snaps develop. The snow and cold weather in the Northwest have even now produced a noticeable effect in some lines, and especially in the demand for Black Sheets for Stove Pipe as well as Stove Trimmings. The present rate of business is very much better than in the corresponding period of last year, and it is believed that, taking the very low price of goods now prevailing, the movement will compare very favorably with the best years in the past. Tinware jobbers report quite a good movement in some classes of their specialties, but the general demand is lighter than it has been, while the movement in Metals is very considerably smaller. Heavy Hardware jobbers report a very good trade in Iron, Steel, and Wagon and Carriage Stock.

Advices from St. Louis—The Hardware jobbing trade are feeling the effects of the changed condition of the weather. On the 30th ult. the entire West and Southwest was treated to a most liberal rain, followed by cold weather. Thus in one stroke the two impediments to trade, the drought and the yellow fever scare, were practically removed. The demand for cold weather goods is remarkably active and bids fair to continue for the balance of the year. Reports from traveling men are extremely promising, and as they are usually accompanied with liberal orders more attention is given them than if no orders followed. The territory tributary to this market is in better condition than it has been for years past. Money is plentiful, and those that have it seem willing to spend it, so that reports of increasing trade from all parts of the West and Southwest are now becoming quite common. The advances which have already been made are being well maintained, and as there appears to be no disposition to crowd prices upward the general situation is very healthy. Collections are excellent, many dealers discounting bills who heretofore took the usual 60 days.

NOTES ON PRICES.

Wire Nails.—Something of a falling off is noticeable in the demand for Wire Nails, but most of the manufacturers are still well occupied. Some of them, indeed, are behind their orders, but as a general rule it is not difficult to obtain prompt shipments. The market is not quite so strong in tone. New York quotations for small lots from store are $1.65 to $1.70.

Advices from Chicago.—Manufacturers report only a moderate demand, with the exception of Kansas and Nebraska trade, which is quite heavy owing to low freight rates. They look for a large business with Colorado points as soon as freight rates are believed to be at bottom. The advancing tendency of prices has stopped, but factories are quite firm. Jobbers quote small lots from stock at $1.55 to $1.60.

Advices from St. Louis.—There is no change to note in Wire Nails. The demand is quiet, which is not unexpected at this season of the year. Prices are well maintained, however, and both manufacturers and jobbers are getting full prices. Jobbers ask $1.65 to $1.70, base, for small lots from store.

Cut Nails.—The market at present is an open one. The New York price for small lots from store is $1.43, this figure being sometimes slightly shaded. The demand is referred to as fair but not heavy.

Advices from Chicago.—A steady but small business is in progress in Cut Nails, in which the trade is now centered in very few hands in this locality. Small lots are quoted at $1.50.

Advices from St. Louis.—There is no change to note in Cut Nails. Jobbers are asking $1.45, base, for small lots from store.

Barb Wire.—The Barb Wire market is steady, with a moderate volume of business. Quotations are unchanged.

Advices from Chicago.—Manufacturers report a good movement to some localities which are favored by reduced freight rates, but the demand from other sections is quiet at present, as usual at this time of the year. Factories are still busy on contracts and have not yet begun to pile up stock. Small lots from stock are quoted at $1.60 for Painted and $1.90 for Galvanized.

Advices from St. Louis.—Mills report a fair demand only for Barb Wire, but prices are firmly maintained. Jobbers' sales are light and prices quoted are $1.65 for Painted and $1.95 for Galvanized.

Wrought Iron Pipe.—The market on Wrought Iron Pipe is very firm and the arrangement recently adopted by the manufacturers in regard to deliveries on carload lots and no deliveries on less than carload lots is referred to as working satisfactorily.

Carriage Bolts, Machine Bolts, &c.—There is little change to note in this line of goods since our last report. The manufacturers appear to be succeeding quite well in maintaining the slight advance decided upon at their recent conference. The jobbers, however, are still cutting prices pretty freely, thus working off some of the stock which they accumulated at the lower prices which resulted after the breaking up of the combination.

Steel Clad Bathtubs.—Under date of October 20, 1897, the manufacturers of Steel Clad Bathtubs and All Steel Enameled Tubs have issued the following standard price-list on these articles, superseding all other lists:

Standard List Steel Clad Copper Lined Baths.

This list applies to all Tubs made with a steel outer casing with tinned and planished copper lining.

AMERICAN PATTERN—SHALLOW.

Standard Tub. Sometimes called No. 2.

Common Overflow.

Size	Weight, Copper Lining, 12 ounces.	14 ounces.	16 ounces.

" 5 "	23.00

Connected Waste and Overflow.

Size, 4 feet.....	$22.50
" 4 " 6 inches.....	23.50
" 5 "	24.50

Glass.—Nothing of especial interest has taken place in the Glass situation during the past week. There are no indications of an immediate start of the factories, while it is certain that Glass will become scarcer as cold weather approaches. A Board of Directors has been elected by the members of the American Glass Company, but the sales agent has not yet been appointed. New York quotations continue to be 60 and 10 and 5 on American Glass, and 80 and 20 per cent. on imported. Chicago jobbers' price for American Glass on the first of the month was 60 and 10 per cent. discount, except for 16 x 20 single strength, this size being 60 per cent. discount. It is anticipated that about November 10 a further advance of 5 and perhaps 10 per cent. will be made.

White Lead.—There has been scarcely any variation in the market. Consumers' purchases were commonplace and merely fair in amount, while dealings all through were at unchanged prices. There is nothing distinctly new in the condition of the market for crude material or in the outside influences otherwise.

Red Lead.—There has been a rather slow market, but sellers quite generally hold to former prices, with more or less showing of firmness.

Spirits Turpentine.—Prices have weakened off to about 33 to 33½ cents for retail quantities, and merely fair business has been done at the decline.

Old Rags, Paper, &c.—A good demand is noted in nearly all lines of Paper Stock. Prices are firmly held. Dealers are paying about the following rates for New York City delivery :

No. 1 White Rags.....per lb.	2⅝ to 2¾c.
No. 2 White Rags.....per lb.	1¾ to 1⅝c.
Mixed Rags.....per lb.	1 c.
Blues and 3ds.....per lb.	1 c.
Hard Sized White Shaving.....per lb.	1¾ to 2 c.
No. 1 White Book Shavings.....per lb.	1½c.
No. 2 White Book Shavings.....per lb.	¾ to 1 c.
Light Book Shavings .....per lb.	½ to ¾c.
No. 1 Mixed Shavings.....per lb.	¾ to ⅞c.
No. 2 Mixed Shavings .....per lb.	½ to ⅝c.
No. 1 Printed Books.....per lb.	⅞ to 1 c.
Ordinary Mixed Books.....per lb.	½c.
Newspapers .....per lb.	½ to 9/16c.
No. 1 Manila Paper.....per lb.	⅝ to ¾c.
No. 2 Manila Paper.....per lb.	⅜ to ½c.
Bogus Paper .....per lb.	⅜c.
Common Paper.....per lb.	¼ to 9/10c.
Straw Chips.....per lb.	⅜c.
Binders' Clippings.....per lb.	½c.
Jute Butts.....per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging.....per lb.	¾ to 1 c.
Mixed Bagging.....per lb.	½ to ¾c.
No. 2 Bagging.....per lb.	½ to ¾c.
Hemp Twine.....per lb.	1⅜ to 1¾c.
Manila Rope..... per lb.	1¾ to 2 c.
Jute Rope.....per lb.	1½ to 1⅝c.
Mixed Rope.....per lb.	¾ to ⅞c.

Old Rubber.—The demand continues active and prices are firm. Local dealers are paying about the following figures :

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb.....	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb..... ...	4 c.
White Syringes, per lb.....	4 c.

The Chicago schooner " F. W. Gifford," laden with a heavy cargo of iron ore, sprung a leak on Lake Michigan last week and sank to the bottom. It is problematical whether the cargo can be recovered.

The increasing demand for platinum has caused a sharp advance in the price of the metal Preparations are being made for developing more extensively the platinum mines in the Ural Mountains, so as to increase the output.

Charles Parsons, inventor of the steam turbine which fitted in the 100-foot torpedo boat " Turbinia" gave her a speed of 33 knots an hour, is about to construct at New-Castle-on-Tyne, England, a vessel of the torpedo boat destroyer type with turbine engines which it is calculated will attain a speed of from 36 to 40 knots an hour.

IT WILL PAY TO GET OUR PRICES FOR

Genuine Bangor Roofing Slate

BEFORE PLACING YOUR ORDERS.

BANGOR EXCELSIOR SLATE CO., - Easton, Pa.

QUARRIES AT BANGOR, PA.

CLASSIFIED LIST OF ADVERTISERS.

Agate Ware.
Lalance & Grosjean Mfg. Co., 19 Cliff St., N. Y.

Agricultural Furnaces.
Wheeler, Russel & Son, Utica, N. Y.

Architectural Ornaments.
Frand, Martin J. & Co., Camden, N. J.
Friedley & Voshardt, Chicago, Ill.
Mullins, W. H., Salem, Ohio.
Soutner, E. E. Iron Co., St. Louis, Mo.
Willis Mfg. Co., Galesburg, Ill.

Ash Cans.
Central Stamping Co., 23 & 25 Cliff St., N. Y.
Dover Stamping Co., Boston, Mass.

Bathtubs.
Peck Bros. & Co., New Haven, Conn.
Wilson, R. M., Rome, N. Y.

Beer Pumps.
I. X. L. Beer Pump Co., Phila., Pa.

Boilers, Copper.
Randolph & Clowes Waterbury, Conn.

Books.
Tower, F. W., Springfield, Mass.

Bronze and Bronzing Liquid.
Griffing, A. A. Iron Co., 66-68 Centre St., N. Y.

Building Paper.
Kansas City Roofing & Cor. Co., Kansas City, Mo.

Can Makers' Tools and Machines.
Bliss, E. W. Co., Brooklyn, N. Y.
Crosby, G. A. & Co., Chicago, Ill.
Gordon, W. J., Phila., Pa.
Niagara Stamping & Tool Co., Buffalo, N. Y.
Robinson, J. M. & Co., Cincinnati, O.
Stiles & Parker Press Co., Brooklyn, N. Y.

Castings.
Cheney, S. & Son, Manlius, N. Y.
Forest City Fdry. & Mfg. Co., Cleveland, Ohio.

Ceilings, Metallic.
American Corrugating Co., St. Louis, Mo.
Cambridge Roofing Co., Cambridge, O.
Canton Steel Roofing Co., Canton, O.
Eller, J. H. & Co., Canton, O.
Frand, Martin J. & Co., Camden, N. J.
Friedley & Voshardt, Chicago, Ill.
New York Iron Roofing & Cor. Co., Jersey City, N. J.

Cellar Drainers.
Kemp, C. M. Mfg. Co., Baltimore, Md.

Coffee Pots.
Rochester Stamping Works, Rochester, N. Y.
Rome Mfg. Co., Rome, N. Y.

Coils.
National Pipe Bending Co., New Haven, Conn.

Conductor Pipe and Elbows.
Berger Bros., Philadelphia, Pa.
Bowers, L. M. & Co., Binghamton, N. Y.
Cantou Steel Roofing Co., Canton, O.
Cincinnati Corrugating Co., Piqua, O.
Lawrence-Letts Elbow Co., Ltd., Waverly, N. Y.
Lyon, Conklin & Co., Baltimore, Md.

Taylor, N. & G. Co., Philadelphia, Pa.
Wood, W. D. Co., McKeesport, Pa.
Wood Co., Alan, Philadelphia Pa.

Sheets, Galvanized.
Ætna-Standard Iron & Steel Co., Bridgeport, O.
Apollo Iron & Steel Co., Pittsburgh, Pa.
Bruce & Cook, 186 to 190 Water St., N. Y.
Cinn Corrugating Co., Piqua, Ohio.
McCluro & Co., Pittsburgh, Pa.
McCullough Iron Co., Wilmington, Del.
Republic Iron Works, Pittsburgh, Pa.
Taylor, N. & G. Co., Philadelphia Pa.
Wood Alan Co., Philadelphia, Pa.

Shingles and Tiles, Metallic.
Berger Mfg. Co., Canton, O.
Burden, W. J. & Co., Detroit, Mich.
Cortright Metal Roofing Co., Philadelphia, Pa.
Graff Roofing Co., Pittsburgh, Pa.
Meurer Bros. Co., Brooklyn, N. Y.
Montross Metal Shingle Co., Camden, N. J.
Thorn Shingle & Ornament Co., Philadelphia, Pa.

Shot.
Colwell Lead Co., 63 Centre St., N. Y.

Siding. (*See Roofing and Siding.*)

Sinks.
Lalance & Grosjean Mfg. Co., 19 Cliff st., N. Y.

Skylights.
Rasuer & Dinger, Pittsburgh, Pa.

Slaters' Tools.
Galt, Jno. & Sons, 253 Broadway, N. Y.
Salem Nail Co., 292 Pearl St., N. Y.

Slitting Shears.
Watrous & Co., Troy, N. Y

Snow Guards.
Halliday, M., East 9th St., N. Y.

Solder.
Bruce & Cook, 186 to 190 Water St., N.Y.
Follansbee Bros. Co., Pittsburgh, Pa.
Gummey, McFarland & Co., Phila., Pa.
McClure & Co., Pittsburgh, Pa.
Meurer Bros. Co., Brooklyn, N. Y.
Sanborn, J., 217 Water St., N. Y.
Taylor, N. & G. Co., Philadelphia, Pa.

Soldering Furnaces.
Burgess Soldering Furnace Co., Columbus, Ohio.

Speaking Tubes and Whistles.
Ostrander, W. R. & Co., 204 Fulton St., N. Y.

Specialties Manufactured.
Burrows, F. S., 107 Beekman St., N. Y.

Statuary, Sheet Metal.
Mullins, W. H., Salem, O.

Steam and Gas Fitters' Supplies.
Curtis & Curtis, Bridgeport, Conn.
Kieley, T., 7-11 West 13th St., N. Y.

Steel Stamps and Stencil Dies.
Schwerdtle & Siebert, Bridgeport, Ct.

Stove Linings.
McLeod & Henry Co., Troy, N. Y.
Marcy Stove Repair Co., 74 Beekman St., N. Y.
Newton & Co., Albany, N. Y.
Presbrey Stove Lining Co., Taunton, Mass.
Valentine, M. D. & Bro. Co., Woodbridge, N. J.
White, N. E. Co., Utica, N. Y.
Williams Stove Lining Co., Taunton, Mass.

Stove and Metal Polish.
Hoffman, Geo. W., Indianapolis, Ind.

Stove Patterns.
Bascom, H. Clay & Co., Troy, N. Y.
Cincinnati Pattern Works, Cincinnati, Ohio.
Cope, G. W., Detroit, Mich.

Richmond Stove Co., Norwich, Ct.
Ringen Stove Co., St. Louis, Mo.
Schuylkill Valley Stove Co., Spring City, Pa.
Sheppard, Isaac A. & Co., Phila., Pa.
Somerset Stove Foundry Co, Somerset Mass.
Thatcher Furnace Co., 240 Water St., New York.
Van, John, Range Co., Cincinnati, O.
Weir Stove Co., Taunton, Mass.

Stoves and Ranges, Gas.
Adler, H., Tr., Pittsburgh, Pa.
Calovit Heating Co., Brooklyn, N. Y.
Reineke, Wilson & Co., Pittsburgh, Pa.
Ringen Stove Co., St. Louis, Mo.

Stoves and Ranges, Oil, Vapor and Gasoline.
Barstow Stove Co., Providence, R. I.
Miller, Edward Co., Meriden, Conn.
Monarch Stove Co., Mansfield, O.
Rathbone, Sard & Co., Albany, N. Y.
Ringen Stove Co., St. Louis, Mo.

Tea Kettles.
Central Stamping Co., 23 to 25 Cliff St., New York.
Rochester Stamping Wks., Rochester, N. Y.
Rome Mfg. Co., Rome, N. Y.
Sweeney, W. H. Mfg. Co., Brooklyn, N. Y.

Tea Pots.
Rochestor Stamping Works, Rochester, N. Y.
Rome Mfg. Co., Rome, N. Y.

Tinners' Tools, Machines and Supplies.
Berger, L. D., Philadelphia, Pa.
Bertsch & Co., Cambridge City, Ind.
Bishop, G. E., Dowagiac, Mich.
Bliss, E. W. Co., Brooklyn, N. Y.
Bruce & Cook, 186 to 190 Water St., New York.
Follansbee Bros. Co., Pittsburgh, Pa.
Keene, Geo. C. & Co., Cincinnati, O.
Lindas, H., Edgerton, Wis.
Niagara Stamping & Tool Co., Buffalo, N. Y.
North Penn Iron Co., Phila., Pa.
Ohl, Geo. A. & Co., Newark, N. J.
Peck, Stow & Wilcox Co, 27 Chambers St., New York.
Stiles & Parker Press Co., Brooklyn, N. Y.
Tinners' Machinery & Supply Co., 26 Cliff St, N. Y.
West Mfg. Co., Buffalo, N. Y.

Tin Plate. (*Mfrs. of.*)
Ætna-Standard Iron & Steel Co., Bridgeport, O.
Atlanta Steel & Tin Plate Co., Atlanta, Ind.
Beaver Tin Plate Co., Lisbon, Ohio.
Bruce & Cook, 186 to 190 Water St., New York.
Coe, Jas. A. & Co., Newark, N. J.
Follansbee Bros. Co., Pittsburgh, Pa.
Gummey, McFarland & Co., Phila., Pa.
Lyon, Conklin & Co., Baltimore, Md.
McClure & Co., Pittsburgh, Pa.
Meurer Bros. Co., Brooklyn, N. Y.
Morton Tin Plate Co., Cambridge, Ohio.
Osborn, J. M. & L. A., Cleveland, Ohio.
Phelps, Dodge & Co., 11 Cliff St., N. Y.
Phillips Tin Plate Co., Inc., Phila., Pa.
Taylor, N. & G. Co., Philadelphia, Pa.

Tinware.
Central Stamping Co., 23 and 25 Cliff St., New York.
Dover Stamping Co. Boston, Mass.
Keen & Hagerty Mfg. Co., Baltimore, Md.
Kleekhefer Bros. Co., Milwaukee, Wis.
Sweeney, W. H. Mfg. Co., Brooklyn, N. Y.

Tools and Machines, Steam and Gas Fitters'.
Curtis & Curtis, Bridgeport, Conn.
Saunders', D. Sons, Yonkers, N. Y.

Tubing, Brass and Copper.
Randolph & Clowes, Waterbury, Conn.

Valves.
Eastwood Wire Mfg. Co., Belleville, N. J.
Jenkins Bros., 71 John St., New York.

Ventilators and Chimney Caps.
Canton Steel Roofing Co., Canton, O.
Globe Ventilator Co., Troy, N. Y.
Iwan Bros., Streator, Ill.
Washburne, E. G. & Co., 46 Cortlandt St., New York.

Washtubs.
Keen & Hagerty Mfg. Co., Baltimore, Md.

Washers, Valves, &c.
Littleford Bros., Cincinnati, O.
Marston, I. G. & Co., Boston, Mass.

Water Closets.
Colwell Lead Co., 63 Centre St., N. Y.
Kelly, Thos. & Bros., Chicago, Ill.
Kenney Sanitary Mfg. Co, 47 Dey St., N. Y.

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Sent, post-paid, upon receipt of price, by

—A NASSAU correspondent of "The Providence Journal" says: "The American wheels are used almost exclusively here. There are several small agencies where cheap wheels are sold. Two branch stores were in existence this year. The manager of one of them was a Connecticut Yankee. He had come to the island with a stock of brand new $100 wheels. Soon after his arrival he found out that there was no market for a high-grade bicycle at list price. The reason for this was that almost any native, by sending ready cash to one of the factories in the States, could get a $100 wheel at a big discount. In fact, with the duty added, the American bicycles could be bought cheaper in this West Indian settlement than the average dealer could get them in the States. But the Connecticut man was not to be disheartened. He did some tall thinking, and at the end of a week started in to let bicycles. Half way through the season he had so much trade that he announced he would clear his expenses."

WISTER—They say the boy is father of the man.

Lobkins—That's right. You know that Griggs never opens his mouth but he puts his foot in it? Well, hundreds of times when he was a baby I've seen him doing the same thing.—*Boston Transcript.*

WILLIS MANUFACTURING CO.,
128 and 130 North Academy St., - - - - GALESBURG, ILLS.

—A STUDENT in one of the Buffalo medical colleges is responsible for the statement that at a certain place of public entertainment one of the boys was bragging of his manifold accomplishments, until one of the company lost patience and said in a gruff tone: "Now, we've heard enough about what you can do. Come, tell us what there is you can't do, and I'll undertake to do it myself." "Waal," replied the student, with a yawn, "I can't pay my account here; so glad to find you're the man to do it." And the critic paid the score, amid roars of laughter from the party.—*Buffalo Commercial.*

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V BURR.

166 pages, illustrated throughout, cloth, price. $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing. Truing. Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing. Drilling Rims.
Chapter VIII.—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

BRIDGEPORT, CONN.

—American Railroad Material Favored.—Russia is showing herself far more broad-minded than Germany in connection with the railroads about to be built in China. For whereas Germany expressed her willingness to furnish the money needed for their construction, providing the materials were made in Germany, Russia, which has undertaken the job, has announced her intention of getting the engines, the rolling-stock, the rails, etc., in the best market. It is with this object in view that Privy Councillor Joguvitch, who has recently been appointed by the Czar to the post of director-general of the China railroad system, is coming to America for the purpose of making extensive purchases in the United States.—*New York Tribune.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

400-Page Catalogue, also Special Catalogues of

BICYCLE AND ELECTRICAL TOOLS.

No. 74½ Geared Press with Cam-Actuated Stripper Device (Patented).

It is well known that piercing dies having stationary strippers are liable to distort the plates which are pierced by them to such an extent as to require subsequent straightening. These stationary strippers are also a great hindrance to rapid and accurate work, the blank having to be placed under and withdrawn from them in a very inconvenient and time-taking manner.

By attaching the stripper plates to the stripper rods which receive their vertical motion through two cams on the shaft, a clear space is left between punch and die, enabling the operator to manipulate and observe his work quickly and accurately. The stripper plate comes down on the blank first, straightening and clamping it before the punches enter, and holding it under pressure while the punching and stripping is being done. In this manner the work comes out perfectly straight and true. As the stripper plate moves up and down with the punches, they may be made shorter than a stationary stripper would admit of, making them considerably more resistant and durable.

A smaller hole in proportion to the thickness of stock may be pierced in this manner because of the close support which the movable stripper gives to the punches up to the point where they enter the stock.

Write for further particulars. Correspondence Solicited.

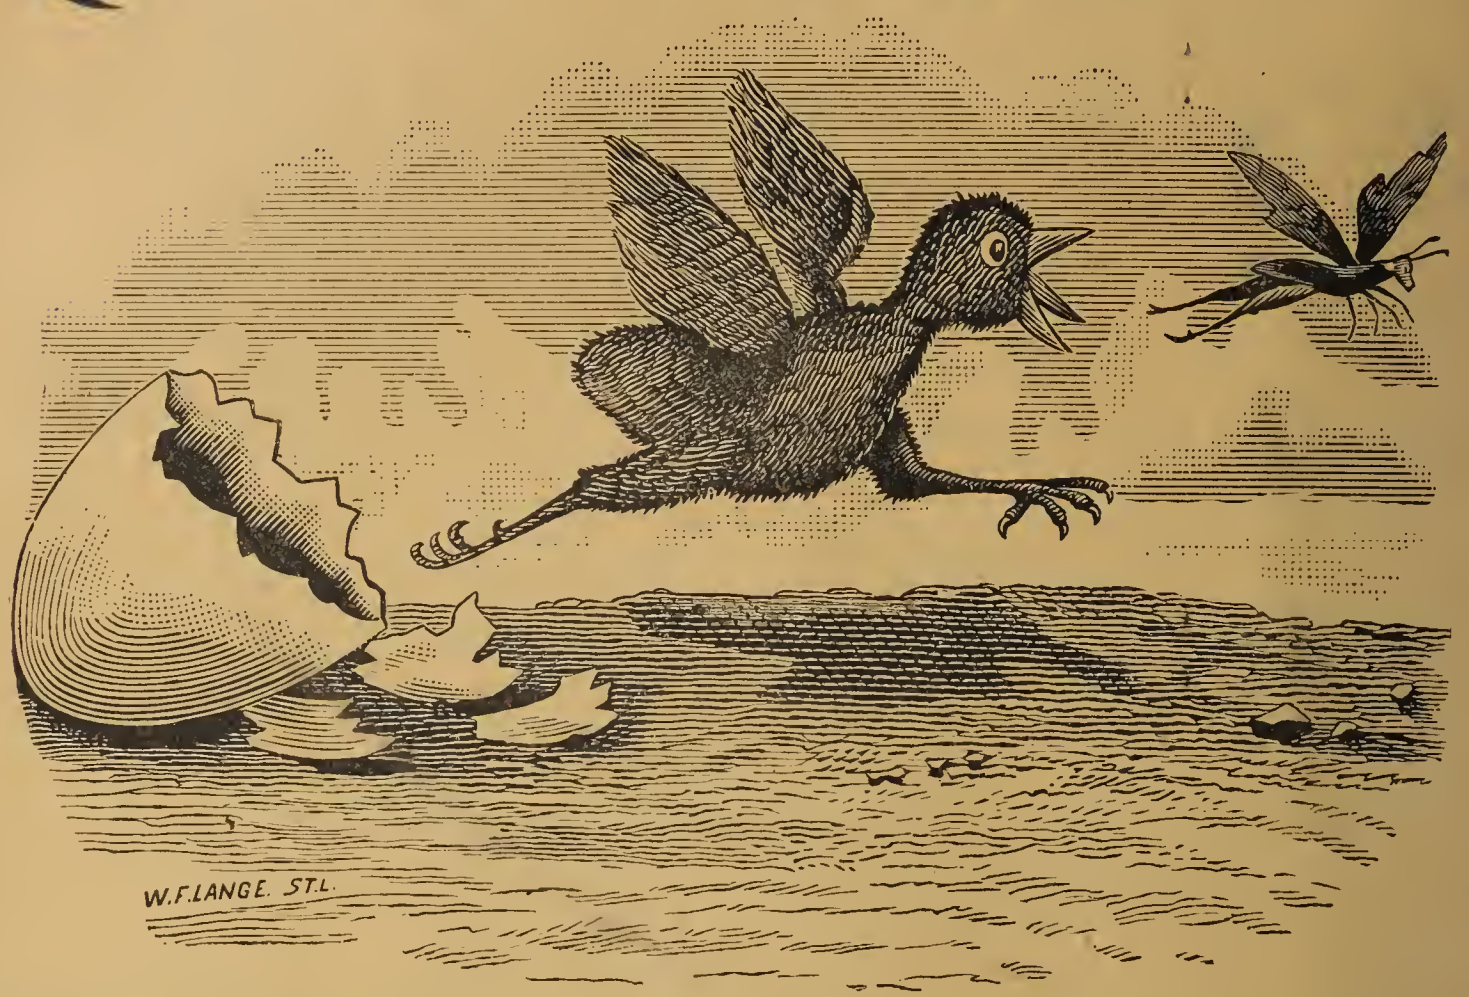
QUICK MEAL



"Quick Meal" Gasoline Stoves.
"Quick Meal" Gas Ranges.
"Quick Meal" Blue Flame Oil Stoves.

We beg to announce to our many patrons that the "Quick Meal" for 1898 will be replete with all the features that have made it famous in the past. Special attention has been given to all details, and improvements have been added to keep the "Quick Meal" fully abreast or ahead of the times.

Encouraged by the unqualified success of 1897, we shall bring into play all our manifold resources to place the "Quick Meal" more prominently before the trade than ever.

Our long experience and our wide reputation give us advantages that others lack. The same onward and upward policy that has marked the progress of the "Quick Meal" in the past will be pursued in the future, and with increased facilities and wider scope this policy will, of necessity, be enlarged upon.

Faithfully yours,

THE GORMAN RADIATOR REST!

A thoroughly practical device to finish under Radiators to assist steam fitter in making nice work.

Protects Floors, Carpets and Ceilings from Heat and Leakage.

Mfd. by GORMAN-ENGLISH CO.,
59 Northampton St., Wilkes-Barre, Pa.
U. S. AND CANADA PATENTS.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF
Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

THE
WASTE-HEAT
RADIATOR

saves the heat that is usually wasted up the chimney; takes the cold air off the floor and heats it; takes the hot air from the ceiling and puts it on the floor; **saves a fourth to half the coal.** As the cold air is drawn in and up from the floor the hot air on the ceiling comes down to take its place, securing a continuous circulation.

The Waste-Heat Radiator Attached to a Stove.

TO STOVE AND FURNACE DEALERS:

DEAR SIRS:—The Waste Heat Radiators have been in use in Minnesota and other parts of the Northwest, where the thermometer often registers thirty to forty degrees below zero, for the past three years and have been thoroughly tested, so they are no experiment; but until within the past few months, they have been made only in a limited way, as each one had to be made to order owing to the difference in the height of the collars on different stoves and furnaces, but now we can make them with sliding collars and that they can be adjusted to fit any stove or furnace, therefore can make them in large quantities and do a general business in them.

The following people have used them during the past two or more years, to any of whom we refer: W. W. Rand, Sec'y Minneapolis Gas Light Co., Minneapolis, Minn.; J. C. Oswald & Co., Minneapolis, Minn.; Wm. Cunningham, St. Paul, Minn.; R. A. Lanpher & Co., St. Paul, Minn.; M. M. Gasser Co., Duluth, Minn.; W. W. Schiffman, Duluth, Minn.

The letter printed herewith from Mr. Clifford Hubbell, Cashier of the Columbia National Bank, Buffalo, N. Y., speaks for itself.

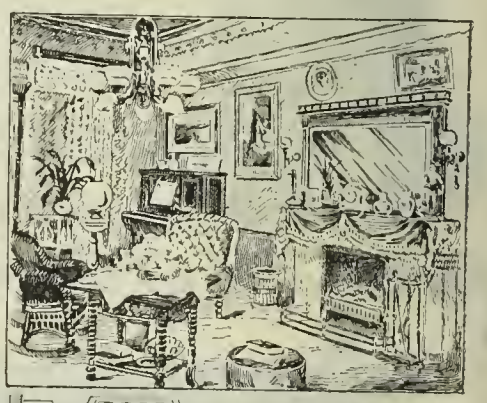
COLUMBIA NATIONAL BANK OF BUFFALO.
JOSIAH JEWETT, President.
CLIFFORD HUBBELL, Cashier.

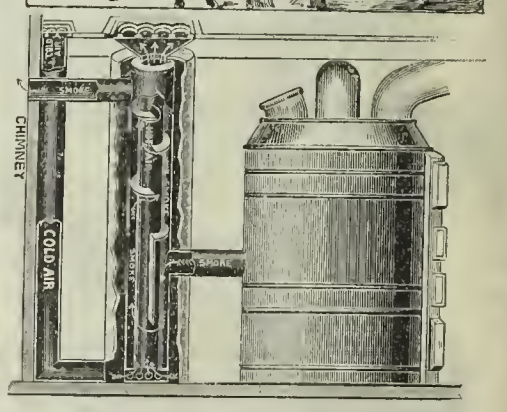
BUFFALO, N. Y.

DEAR SIRS:—Regarding the Waste Heat Radiator which you placed in my residence, No. 71 Highland Ave., I have to say that it has worked admirably. I believe that the furnace burns 25% less coal now than formerly, and I think that that percentage is a very low estimate. In my mind the greatest advantage is that it draws the cold air from that part of the house where the cold air most accumulates, and makes the temperature in the rooms much more even, conducing thereby to comfort and healthfulness. I know that my wife, being skeptical about patent inventions of any kind, before this was put in, has come to acknowledge that this accomplishes the purposes for which it was purchased: viz., to save a large portion of the waste heat that goes up the chimney, and to save in the amount of coal burned, and make the temperature more even.

Yours respectfully,
CLIFFORD HUBBELL, Cashier.

In order to introduce our Radiators we will send one to any reliable Stove or Furnace Dealer and if he finds it as we represent it then we want him to buy it and take the exclusive sale of them in his city; otherwise to hold it subject to our order. Yours truly,

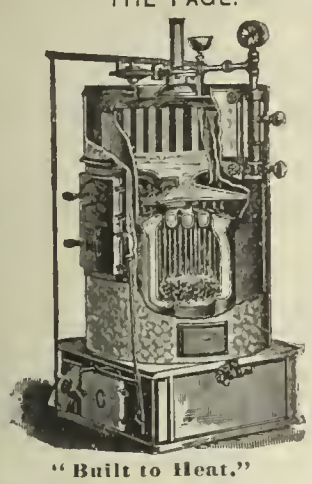




The WASTE-HEAT RADIATOR attached to a hot-air furnace; attaches to steam and hot-water boilers in the same way.

T. H. GREEN & CO., - DULUTH, MINN.

WASTE-HEAT RADIATOR CO., BUFFALO, N. Y.



"Built to Heat."

SPEAKING OF MAN.

Even the "new woman" admits he is "a good thing to have in the house."

STEAM AND HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

"The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*

"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

PRACTICAL HINTS

—ON—

JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

—GOVERNOR DRAKE, of Iowa, in a recent speech, told a new story of a meeting between Lincoln and A. H. Pickering, of Chicago. Mr. Pickering, who is a very tall man, was a resident of Iowa at the time of Lincoln's election, and was engaged in shipping cattle. He and Mr. Drake came to Chicago on business, and, hearing that Lincoln was in the city, they sent up their cards, and were shown to the President-elect's room. "When we got to Lincoln's room," said Governor Drake, in his speech, "he opened the door, and on seeing Pickering asked, 'How tall are you?' Pickering said, 'Six feet four.' 'Why,' cried Lincoln, 'that's my height. Let's measure.'" And then the President of the United States and the cattle-shipper stood back to back, while the first lady of the land, Mrs. Lincoln, who was a little woman, after standing on tiptoe and reaching to the tops of their heads, decided that it was a tie.

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex.

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

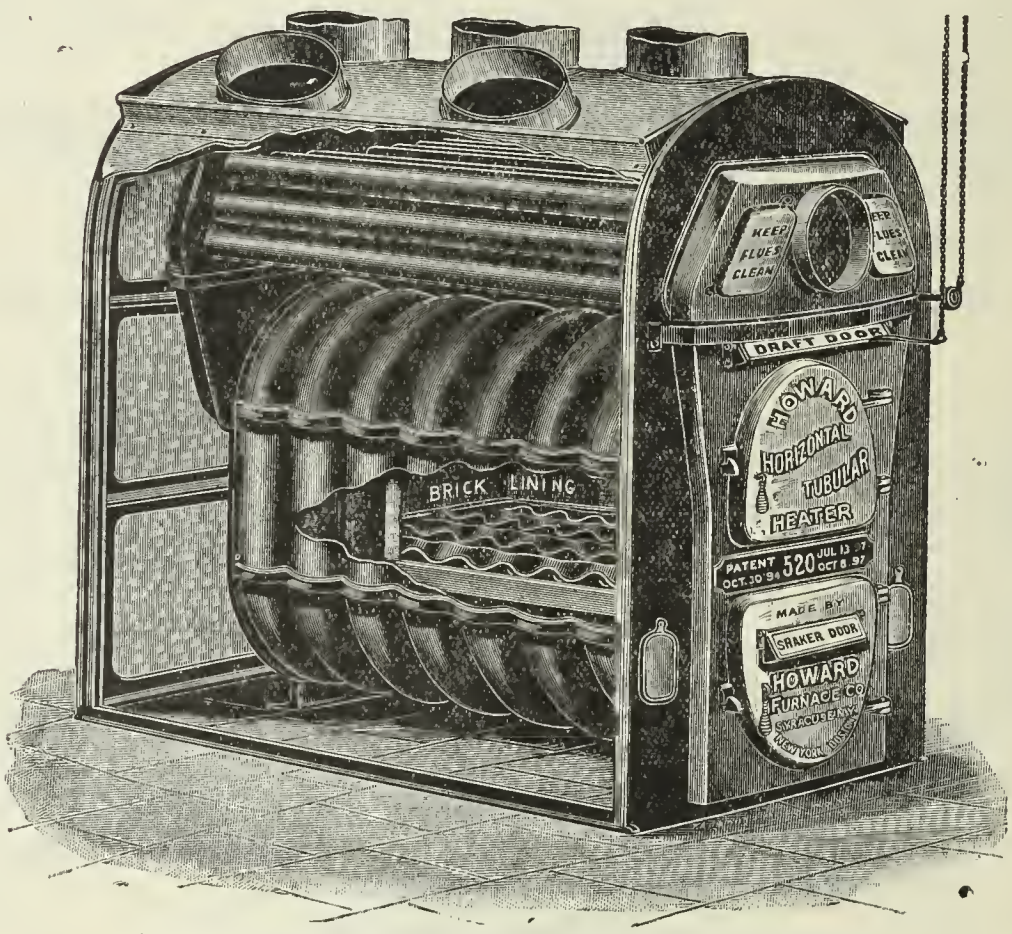
for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

Sent, Express or Postage paid, on receipt of price, FIVE DOLLARS, by

DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., New York.

difference in talk

The wide awake dealer is the successful dealer. He is progressive. He is the man who tries to please his customers. If any new improvements are made he wants to know them. As soon as he finds out the worth of these improvements he buys. He knows that if he buys good goods he can sell them. He knows that all the good new things have merit. It is the merit of articles that he can talk about. His talk sells the goods. If he does not talk, he knows he cannot expect to do much business. If he buys old fashioned goods, his talk is old fashioned. If his goods are ordinary, his explanations to buyers are ordinary, but if he buys the latest and most approved goods his talk is different, his goods are different—in fact, everything about him is so distinctively new, that the public recognize all these things and patronize him in preference to his competitor. Now if all this be true, why not enquire about this new furnace?



Patented: Oct. 30, 1894. July 13, 1897. Oct. 5, 1897.

entices new business

This new furnace means new business. It is made to burn anything that will burn—such as hard coal, soft coal, and wood

The Business Situation.

The advent of cold weather in the South has broken the back of the yellow fever scourge. Quarantine restrictions have been removed, bringing about resumption of traffic and a welcome rush of orders for merchandise from that section. At the same time the more seasonable weather which has followed the rains in the Western and Central Western States has favored the farmers and stimulated the demand for winter goods in that region. For which reasons business throughout a large part of the country is still notably brisk. Otherwise the movement of trade in staple lines has been of the quiet character which usually marks the early winter months. In the Eastern States business is found to be somewhat irregular and of moderate volume all told. Nor is any marked improvement in this respect looked for during the balance of the year. Stocks of manufactured goods in dealers' and consumers' hands are believed to be fairly full, and there is no likelihood of any special pressure of orders in the immediate future. Still a fairly liberal movement of goods is expected to continue during the next few weeks, while the indications point to a marked increase in its volume after the opening of the new year. Meanwhile mills and factories are generally busy on orders and in making up stock to meet the large demand anticipated for 1898. Prices in most lines of trade show no material change, but are holding their ground well. The metal trade seems to be an exception, however, for a tendency toward weakness has been developed in copper, lead and spelter, while tin has lost ground during the week. In the iron and steel trade, a falling off in the volume of orders for manufactured goods is noted, but prices are well maintained and the mills have as much work as they can do in filling the contracts booked during the past two or three months. All the accepted indices of trade, such as bank clearings, railway earnings, records of failures, exports, &c., continue encouraging. Last week's total of bank clearings reached nearly $1,250,000,000, or 6 per cent. above those of the previous week, notwithstanding the occurrence of the election day holiday. As compared with the corresponding week of last year they showed a gain of 17.9 per cent. and of 3 per cent. over 1892. Current railway earnings exhibit a very satisfactory increase of about 11 per cent. above last year. Commercial failures in October were smaller in number and liabilities than in any month for four years, except in July and August of this year and in one month of 1894. Wheat fell nearly 4 cents a bushel during the week, although the exports of the cereal are still unusually heavy, while *Bradstreet's* states the available stocks to be lower than at any previous date since 1890. Corn exports, although still small, in comparison with wheat shipments, showed a marked increase last week over the preceding week and over the corresponding period of former years. The price of corn has advanced slightly, but cotton remains at the low price recently touched. The shipments of the staple are increasing, and all indications point to an enormous crop. Money has developed further ease, a superabundance of loanable funds being held by the banks and the demand from borrowers being comparatively light.

Chicago Strike History.

A very interesting table of strikes in Chicago and their results, covering the last 16 years, was recently contributed by a labor leader to a Chicago daily paper. The list enumerates 76 strikes of all kinds, including railroad employees, and in each case the duration and the number of men involved is given. The success or failure of the movement is also recorded. Of the entire number 28 were unequivocally successful, 21 only partially so, and 27 were totally unsuccessful. The successful strikes were principally, and in fact almost entirely, in the building trades. Only nine strikes are credited to the iron and steel and allied industries during this entire time, and of these only one succeeded, while another was partly decided in favor of the employees. The successful strike was among the ornamental iron workers, during the preparations for the World's Fair in 1893, who demanded increased wages and shorter hours. The partly successful strike was in 1886, when molders in brass and iron foundries went out to secure a reduction of hours. In all other strikes in these special trades the workmen were defeated. The results in other manufacturing industries were relatively of the same character.

Strikes in the Building Trades.

The most important inference to be drawn from this table appears to be that workmen in the building trades in large cities are quite uniformly able to maintain their point in a test of endurance with employers over a question of wages schedules or hours of employment. On the other hand, the inference seems to be equally plain that in manufacturing industries the employers are generally able to sustain their contention when a clash of opinions occurs. On looking into the conditions governing these respective vocations, the reason is not hard to find. House building is radically different from manufacturing, because the product is not portable, and competition from an external source as affecting cost or market price or power to sell is wholly absent. Employers and workmen in the building trades of a city can fix a schedule of wages and hours without regard to the practice in any other place on earth, and their business will not be endangered unless they run the cost of building to

such exorbitant figures that owners are deterred from making improvements. Hence, a decided show of strength and cohesive power among workmen in such lines nearly always wins when pitted against builders or contractors, who know that if they lose the point in dispute the owner or capitalist pays the increased cost. But in manufacturing the situation is altogether different. Other factories at other points are competing in marketing the same sort of product, prices are fixed usually by a variety of circumstances operating in the commercial world, and wages and hours are regulated by influences which an individual manufacturer must recognize or be eliminated from the struggle for business. Therefore the success of labor movements in the building trades cannot be properly cited as an incentive for more radical efforts among labor leaders in manufacturing lines.

A Manual Training School at Pullman.

The will of George M. Pullman includes the following provision: "It is my purpose to found, erect and endow at Pullman, Ill., in my lifetime a free school of manual training for the benefit of the children of persons living or employed at Pullman, and in the accomplishment of that purpose to expend at least $200,000 for lands and buildings and apparatus and to provide a fund of $1,000,000 for the maintenance, management and endowment of such school. If, at the time of my death, I shall have founded such school, but shall not have fully made such expenditure or provided fully such fund, I direct that my executors, out of the remainder of my estate, after satisfying all the provisions hereinbefore made, shall set aside stocks, bonds and notes or other securities of the value estimated by them to be sufficient to make, with the moneys already expended by me for such lands, buildings and apparatus, the sum of $200,000, and the properties so set aside I give and bequeath for said objects to the corporation or trustees representing said school, and I further direct that my executors, out of said remainder of my estate, shall set aside bonds, stocks and notes or other securities of the value estimated by them to be sufficient, with the fund already provided by me for the maintenance, management and endowment of such school, to make the sum of $1,000,000, and the properties so set aside I give and bequeath for said objects to said corporation or trustees. If, at the time of my death, I shall not have founded such school, I hereby give and bequeath, out of said remainder of my estate, the sum of $1,200,000 for the founding, erection, maintenance, management and endowment of the Pullman Free School of Manual Training, at Pullman, Ill. and I direct that my executors shall, so soon as practicable, cause a corporation to be formed, either through act of the Legislature of the State of Illinois or under the laws of said State, for the purpose of receiving said bequest and accomplishing the objects thereof. And I request that my executors, Norman B. Ream and Robert T. Lincoln, and my friends John M. Clark, John S. Runnells, Frank O. Lowden, Charles E. Perkins and John J. Mitchell, act as the first Board of Directors or Trustees of said corporation."

William Connor's New Works.

The Olympic Mill property, 669, 671, 673 and 675 River street, Troy, N. Y., has been bought by William Connors for $40,000. This is one of the best manufacturing sites in Troy and has been owned by Orrs & Co. since 1835. It has two large water wheels of 150 horse-power each. Mr. Connors proposes to remodel the present building and equip it especially for the manufacture of American Seal paint, and erect a separate building, which will be used exclusively for the grinding of dry colors. The machinery to be used in operating this plant will be entirely new, of which Mr. Connors is the sole owner and patentee. This extensive improvement is actuated by the steadily increasing demand for American Seal paints, and when completed will be one of the finest plants of its kind in this country. It will be five stories high, with a frontage on River street of 123 feet, running back to the river about 100 feet. Plans are now under way and work will be begun at once and must be completed before March 1.

United States Consul Duester, at Crefeld, Germany, reports to the State Department the discovery there of a new illuminating gas. According to Mr. Duester's account a single jet of this gas of ordinary size gives a light of more than 1000 candle power, and fine print can he read at a distance of 100 feet. The inventor says that the cost for a light of 1500 candle power is only 4½ cents per hour, while that for an ordinary electric light of 400 candle power is 14 cents per hour.

Nashville Awards.

Dr. Gardner Hubbard, Commissioner of Awards, and Dr. David T. Day, secretary of the Jury of Awards, of the Tennessee Centennial Exposition, have reported the awards made in all classes of exhibits. Those of special interest to the readers of *The Metal Worker* are as follows:

Diploma of Honor with Gold Medal.

Schill Bros., Crestline, Ohio.—Warm air furnace.

Diploma of Excellence with Silver Medal.

Wagner Mfg. Company, Sidney, Ohio.—Aluminum. A creditable exhibit of tea kettles, saucepans and other utensils.

Seates Furnace Company, Knoxville, Tenn.—Warm air steel furnace.

Kernan Furnace Company, Utica, N. Y.—Hot air furnace.

Instantaneous Water Heating Company, Chicago, Ill.—Water heaters.

H. Witter Mfg. Company, Memphis, Tenn.—Cooking stove and kitchen ranges.

Buck's Stove & Range Company, St. Louis, Mo.—Buck's steel ranges.

The Michigan Stove Company, Detroit, Mich.—Stoves and ranges.

Phillips & Buttorff Mfg. Company, Nashville, Tenn.—Heating and cooking stoves.

The Cortland-Howe Ventilating Stove Company, Cortland, N. Y.—Stoves.

Nashville Gas Light Company, Nashville, Tenn.—Combination stoves for gas, coal or coke; gas range with hot water attachment.

Bucket Pump Company, Cincinnati, Ohio.—Corrugated triple bottom coal hod, made out of one piece of pressed steel.

Webb, Stevenson & Phillips, Nashville, Tenn.—Stoves, heating and cooking; wood mantels, refrigerators, china, lamps, &c.

Trans Abr Santesson, Stockholm, Sweden.—Hollow ware of tin plate.

To Incinerate Chicago's Garbage.

Andrew J. Murphy has contracted with the city of Chicago to dispose of garbage and ashes for five years at a total cost of $1,251,351. It is his intention to use the Wright system of incinerating the garbage, which is not familiar to Americans but is in use in a number of English and Continental cities, notably London, Liverpool, Birmingham, Leeds and Hamburg. Six incinerating plants are to be built at as many different points in Chicago.

The furnace, which is the essential point of the plant, is built in cells, each cell having a capacity sufficient to accommodate 1 ton of garbage. The cells are lined with fire brick and have a hearth sloped from the center outward, forming a central ridge on which the garbage strikes when dumped into the furnace. The products of combustion pass through separate flues from each cell into the main flue or tunnel, which is in the central part of the furnace, and where the gases are burned before entering the chimney. This fire flue is underneath the bed of the furnaces and serves to keep them heated. The heat for burning the garbage, however, is secured from the flame of crude oil injected from the side of the cell. The amount of garbage that is to be collected daily in Chicago is estimated at 600 tons, so that each of the six furnaces is to have a capacity of 100 tons. Each furnace contains ten garbage cells, holding 1 ton each, and it is estimated in an hour's time this amount will be consumed, so that the furnaces will have to be worked ten hours a day to destroy the entire garbage of the city. The ashes resulting from the garbage, it is expected, will prove a valuable fertilizer, and will be packed in bags and sold. Householders will have to separate the garbage from the ashes and provide a galvanized iron receptacle for the former, the garbage being collected in water tight iron wagons.

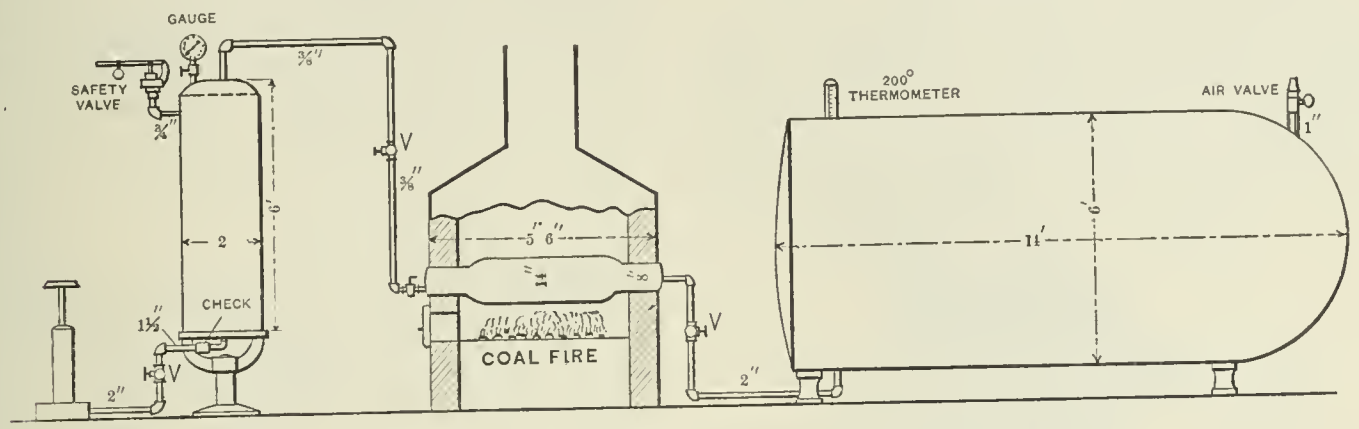
Frederick Haberman of the Haberman Mfg. Company was elected Alderman on the Democratic ticket in the Twenty-ninth district, New York City.

The Glidden Varnish Company, Cincinnati, Ohio, have just completed an addition to their plant, a new brick building 75 feet in length, to give them facilities for the large increase in the demand for their products. They have also added much new machinery to their equipment, and as a result a larger trade is being done.

THE LETTER BOX.

Heating Compressed Air for Vulcanizer.

From H. L. T., Flemington, N. J.—Will you please advise me through the columns of *The Metal Worker* if I can heat compressed air by the plan I send with this letter, Fig. 1. I want to heat molds in a vulcanizer 14 feet long and 6 feet in diameter to 200 or 212 degrees under 30 to 35 pounds pressure. Can it be done? If not by this plan, what suggestion would you offer to heat the air? It is positively necessary to have a dry heat.



Heating Compressed Air for Vulcanizer.—Fig. 1.—Sketch Sent by Correspondent.

Answer.—The heating of a vulcanizing cylinder to a temperature of 212 degrees F. can be readily done by hot compressed air, as our correspondent asks, but the sketch that accompanies his inquiry, which we have reproduced in Fig. 1, does not seem to us to be adequate in detail to accomplish the desired work in the large vulcanizing cylinder shown. We therefore have designed the detailed arrangement, as shown in Fig. 2, with the figured conditions of compression, cooling to condense moisture, reheating for ultimate dryness and temperature, and expansion of the hot air to the required condition of the vulcanizer. The quantity of air required we cannot estimate without knowing the nature of the work to be done. The molds and the shell of the vulcanizer will absorb a large amount of heat at the commencement of each operation, and, as the specific heat of air is very low at the atmospheric pressure (less than one-quarter as much as water per pound, as it requires 13 cubic feet of air to weigh 1 pound) it will readily be seen that a considerable quantity of free air must be passed through the apparatus. Probably 54 cubic feet of free air, or about 14 cubic feet of compressed air at 40 pounds pressure, will be required to do the work in heating equal to the use of 1 pound of water. The drying properties, due to the expansion of hot compressed air, as shown in our illustration, which has been cooled from the compressor and then reheated, is very great. In the modification of our correspondent's plan, we recommend a larger pipe for conveying the air from the compressor to the heater, a cooler of coiled pipe arranged to let the condensed moisture drip into a receiver and a coil of pipe in the heating furnace as being cheaper and more effective than the cylinder shown in the sketch. The hot air should enter the vulcanizer at the top and be allowed to escape at the bottom with the pressure and temperature controlled entirely by the inlet and discharge valves. By this method of governing, the cold air, or air made cooler by contact with the goods and shell of the heater, will sink by gravity to the bottom of the vulcanizer and toward the discharge outlets at each end. Otherwise uniformity of temperature cannot be obtained. By this process very dry air will be obtained and in quantities to meet the requirements. It will also be found that a compressor of more formidable dimensions than the hand appparatus shown in the sketch of our correspondent will be needed for the work required in a vulcanizing cylinder so large as 6 x 14 feet. We suggest a power compressor with a 6 x 7 inch air cylinder.

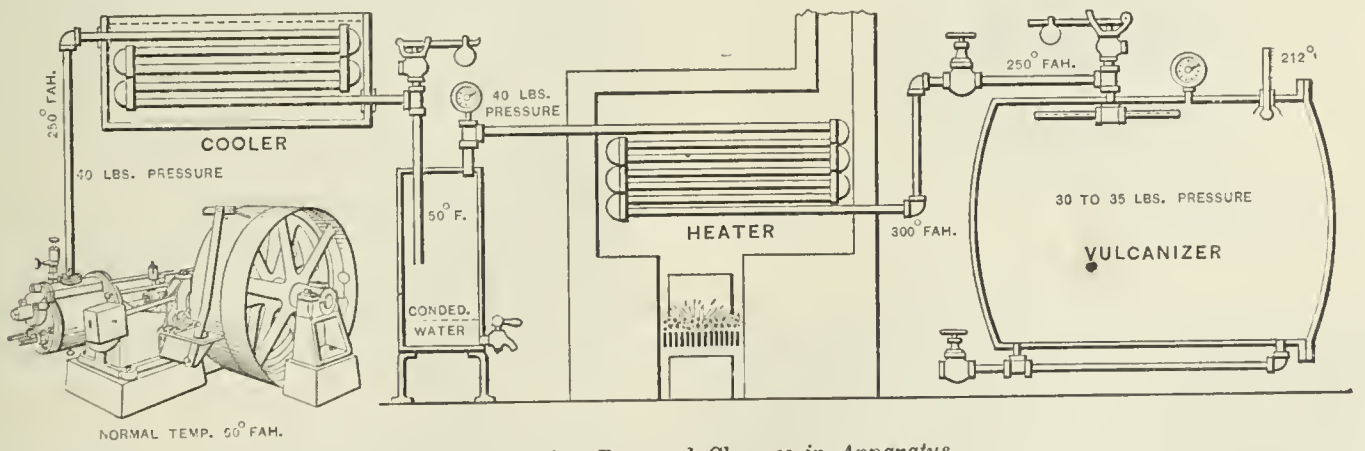


Fig. 2.—Showing Proposed Changes in Apparatus.

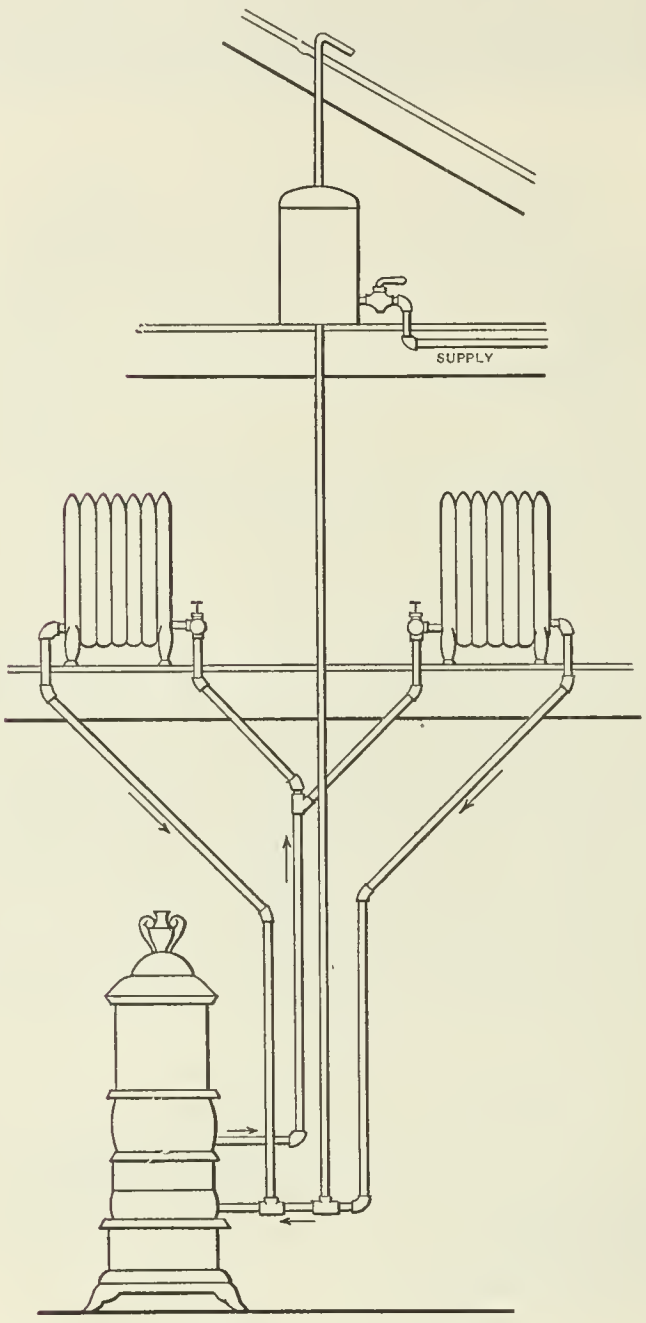
Heating From Stove Coil.

From M. & G., Hartington, Neb.—We submit herewith a sketch and description of a hot water heating apparatus which we wish to install. The fire pot in the stove which we intend to use is 17 inches in diameter and we had calculated to use 29½ lineal feet of ¾-inch pipe

to heat 100 square feet of direct radiation located on the floor above the stove, as shown The question which arises in our mind is, Does the coil have a waterway large enough to fulfill the requirements? We think the ¾-inch coil is too small and that a 1½-inch or 2-inch coil should be used.

Answer.—The ¾-inch coil would heat the water, but it has been found in practice that the circulation is restricted and the water overheated so that steam is liable to be generated when a large coil of such small caliber is used. We notice that the coil in question exposes about 9 square feet, or about 1 square foot of surface for every 10 feet of radiation to be heated, and ordinarily 1 square foot of heating surface in a coil, even in a stove, is looked

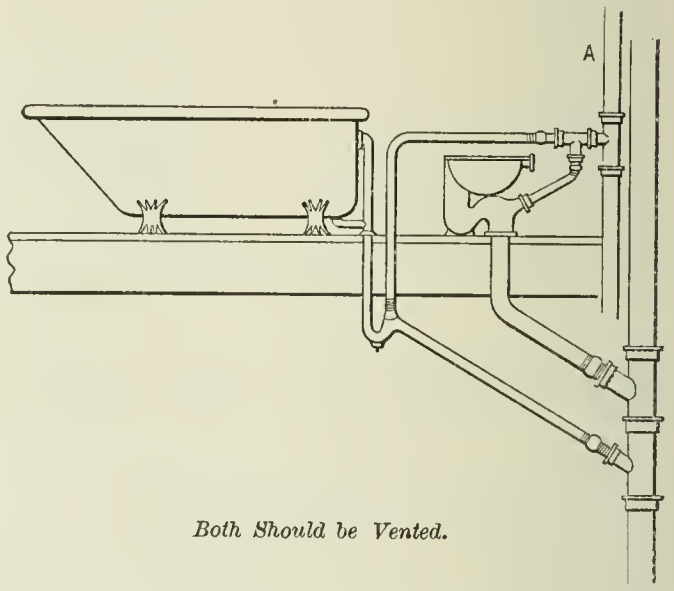


Heating from Stove Coil.

upon as capable of heating more radiating surface than that. Figuring on the basis of 20 square feet of radiating surface to every foot of surface in the coil, 5 square feet of surface would be all that would be required. To determine the size of the pipe that should be used in the coil the size of the radiator connections must be considered. These should be 1 inch for each radiator, and it is generally conceded that a 1¼-inch pipe will supply two 1-inch pipes, and we would suggest that this size would be sufficient for the mains to and from the coil and also that it would be advisable to use this size of pipe in the coil. This, however, is not absolutely necessary, and in this case 1-inch pipe might be used if it can be bent more readily. If our correspondent desires to reduce the amount of piping, the return mains might be connected the same as he has connected the flow mains, and the pipe to the expansion tank might be connected with the return from one or the other of the radiators. If the expansion tank is to be located in a place where there is any possible danger of freezing it would be better to connect a ½-inch pipe with a flow main and run it into the expansion tank at a point below the water line, so as to keep up circulation in it and prevent freezing. If possible the vent or overflow pipe should discharge at a point where it is not likely to freeze. The vapor that may arise from the hot water is liable to collect in the form of frost and finally stop the outlet, and under some conditions would be sufficient to put the whole system under a high pressure and cause its wreckage.

Both Should Be Vented.

From Oliver Twist.—The sketch shown in *The Metal Worker* of September 18 accompanying the letter of "J. R. L," Charleston, is a sample of many such connections. To vent or not to vent is not at the present time a very vexed question. Whatever changes time may make, at the present it is considered by those competent to judge that all traps should be vented. The objection is raised by the house owner usually that to vent all traps is an unnecessary proceeding, making more complicated an already extensive arrangement of piping and whose only good is to swell the plumber's account. People who argue on this line are usually under the impression that it wouldn't matter much if the trap also were omitted or else one was made to answer for several fixtures. If a plumbing job is well planned, neither the waste nor vent pipes will be any longer than are necessary, but however short they may be, the more fresh air that can be got to circulate through and around them the more sanitary they will be and the longer they will last, for to confine sewer gas in a pipe is to assist its corrosion.



Both Should be Vented.

Some regulations require traps to be vented from the crown or the highest point of trap, while others claim there is less liability of the entrance to the vent pipe becoming choked if the junction is made a little further around the bend, as shown in the closet trap in the sketch herewith. It is better practice to connect the bath waste to the soil pipe with a separate branch than to join with the bend beneath the closet, as it will surely be choked by the accumulation of filth passing over it continually if arranged as shown by "J. R. L.," and the bath trap could not resist siphonage for any length of time.

The vent stack A is preferably continued through the roof independently and should be connected to the soil pipe stack with an eighth bend below the lowest fixture, the idea being to remove all condensation.

The fire loss of the United States and Canada for the month of October, as compiled by the *Journal of Commerce*, amounted to $11,387,500, the largest monthly figures in the current year, with the exception of the month of January. The aggregate fire losses for the first ten months of 1897 is, however, still more than $7,000,000 below the losses for the same period of last year and $18,000,000 less than in 1895.

HEATING AND PLUMBING.

Unsatisfactory Prices.

With iron pipe and fittings at a higher price it would seem natural that other heating goods should keep them company. That they do uot is not strange, however, when on investigation it is found that the amount of pipe and fittings used for heating is only a drop in the bucket, as it has been expressed, compared with the amount used in other fields. The downward treud in prices on other heating goods which is being struggled against is the after result of many architects having been poorly employed during the year.

A member of the radiator trade has remarked that prices are unsatisfactory. While the small buyer or the purchaser of a few hundred feet of radiation may not note any waver in the market, it is freely asserted that buyers of large quantities have only to wait to have the goods offered below what is considered the ruling price. A manufacturer of house heating boilers described the situation by saying they held their prices satisfactorily till the opening of the year and then they started in to stiffen up, but in the summer things changed, and changed so much that they simply had to lower prices iu order to get their share of the trade.

Many houses that from the boilerman's standpoint should be heated by steam or hot water have been arranged for furnace heating, as there seems to be strong objection on the part of the buying public to purchase anything that is not low in cost.

Letter from President Culloton.

We have the following letter from President Thos. P. Culloton of the National Association of Master Plumbers, dated Chicago, November 3:

I regret to note in your issue of October 30 an article entitled "Dissatisfaction Amoug Westeru Plumbers," and stating that "Dissatisfaction has arisen over some questions in which it is claiued that the Eastern members have exercised undue influence in the national body. The largest membership in the National Association being in the East, the charge is made that the interests of the West are not so well cared for as they would be with a purely Western association composed of membership residing in the Western States."

This is news to me, as it is to many others in this section and further West, and I think a most erroneous report, for such feelings or conditions I do not believe exist in any quarter of the country, not alone the West. The master plumbers are loyal to the National and there is no desire to form a Western association, composed of members residing in the Western States, apart from the National; and no feelings of any kind but of a harmonious nature exist between the master plumbers in all parts of the Western States as members of the National Association.

Lead Poisoning from Domestic Water Supply.

The following, published in the "Excerpt Minutes" of the British Institution of Civil Engineers, is translated from the *Gesundheits Ingenieur:*

An account is given of a case of lead poisoning which occurred in a forester's lodge situated in a bathing resort in the mountains. The supply of water was formerly taken from a spring, distaut about 50 m. or 60 m. from the house, bnt for the sake of convenience a pump was fitted up in the house and a lead suction pipe was connected with the spring. It came out in the evideuce that the plumber, in laying the pipe, allowed a lot of the lead filings to remain in the joints, soldered in the usual way. A very few days after the completion of the work the daughter of the forester fell ill, and subsequently the mother and the father suffered acutely from colic. Finally the girl died; lead poisoning was diagnosed, and a Government inquiry was instituted into the water supply. The post-mortem had demonstrated the preseuce of lead in several of the organs, and the water, which was extremely pure, was found to contain 0.95 mg. of dissolved lead per liter (about 1½ grains per quart). The degree of hardness was only 1.4. The anthor directs attention to the facts of this case as elicited in the course of the inquiry, and to the manifest danger of the nse of lead service pipes in the case of a water supply of great purity and freedom from hardness.

A New Water Closet Floor Connection.

This invention, exhibited by the Dimock & Fink Company, 220 East 125th street, New York, and 285 Warren street, Jersey City, N. J., at the American Institute Fair, lately held in Madison Square Garden, attracted a great deal of atteution from plumbers, architects and builders on account of its practicability and the advantages it possesses as a sanitary method of connecting a water closet with a house drainage system. The connection is the in-

A New Water Closet Floor Connection

vention of C. H. Moore and consists of a brass screw fitting, so made that it sets into a corrugated and notched recess in the base or foot of an earthenware closet, and is calked with lead and cemented in a tight and immovable manuer, as shown in the cut. A corresponding threaded brass coupling, marked 4, is then soldered to the end of the lead soil pipe or bend, marked 7, that extends through the floor. The closet is screwed into this coupling, giving a permanent and rigid joint which cannot be broken by the jarriug of the closet or the settling of the building. A little paste of oil and plumbago smeared on the threads is used to facilitate screwing up the joint. The brass coupling 4 is marked "Front," so that the plumber when soldering it to the lead bend, marked 7, puts the part so marked to the frout, thus insuring the right position of the closet when screwed down until the base touches the floor slab.

A few of the advantages which are claimed for a closet fitted with this connection are as follows:

The closet cannot be put in place without being screwed down, and therefore nothing but a tight and durable joint can possibly be effected

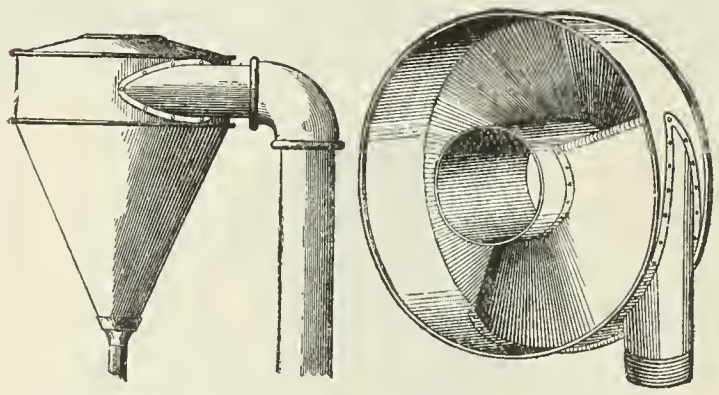
It the closet has to be removed it is only necessary to unscrew it.

Any settling of the building cannot affect the joint.
No liability of breaking the earthen flange.
No liability of discoloring a marble floor with oily substances.

Circulars giving full description and instructions for setting will be sent on application to the manufacturers.

The Common Sense Exhaust Head.

The exhaust head manufactured by Bingham & Co., 221 Cherry street, Philadelphia, contains but one chamber, into which the steam enters at the top. The steam inlet is connected horizontally with the head, and the force of the steam coming into the chamber at the tangent gives it a lateral rotary motion which sweeps it around and around the wall of the chamber. This rotary motion brings the particles of water, grease and oil with which the steam is charged into contact with a very large condensing area, upon which they collect, then run, by gravity, to the drip below. A spiral deflecting plate is so placed as to offer no obstruction. Its only object is to direct the steam downward, so that in the second and succeeding revolutions there can be no conflict or confusion with the incoming steam, and consequently no noise. The discharge pipe does a double duty, being also the trap. It is very deep, the depth being in all size heads three times the diameter of the steam inlet. It will thus be seen that the steam must make quite a number of



The Common Sense Exhaust Head.

revolutions before it reaches the opening of the discharge. By this time it has been divested of all water, oil and grease, so that nothing but dry steam escapes to the outer air. The sectional area of the discharge pipe is three times that of the inlet, free discharge being thus assured.

NOTES.

Hickey & Farrell have opened a plumbing shop in the Gamwell Block, on Columbus avenue, Pittsfield, Mass.

The C. A. Bray Company have been incorporated, with C. A. Bray as president and treasurer, with a capital stock of $5000, at Boston, to carry on a sheet iron work and plumbing business.

At the last meeting of the Board of Health of Williamsport, Pa., a committee of master plumbers entered a complaint that the regulations of the city were not being enforced, and that those plumbers who had paid their license fees and conformed with the law were forced to compete with plumbers who had saved themselves the expense of taking out a license and paid no attention to the city regulations.

We have received from D. A. Streeter, Waterbury, Conn., a circular of his Pipe Plug. The Plug is designed for use in cast iron service and drainage pipes, and is so made that it can be readily removed when the piping system is to be extended, or may be used for testing, being so constructed that it can be calked in the regular way and yet be easily taken out.

The Stradling Heating & Plumbing Company of Utica, N. Y., have secured the contract for heating and ventilating the Masonic Temple now being erected in Utica, The contract calls for two No. 92 Royal Steam Heaters. made by the Hart & Crouse Company, of Utica; Electric Exhaust Fans and Direct and Indirect Radiation. G. Edward Cooper, Utica, N. Y., is the architect of the building, and the heating and ventilating system was designed by W. M. Mackay of New York City. The system will cost about $4000.

James H. Lyons, a prominent business man of Philadelphia, died at his residence, 1608 Wallace street, in that city, on November 5, aged 58 years. He began his business career as a plumber and afterward became an operative builder, putting up over 1000 houses in the northwest section of Philadelphia. Six years ago he built the Keystone Pottery, at Trenton, N. J., and operated it with two partners. On April 1 last he withdrew from the concern and organized the Lyons Pottery Company, for the manufacture of sanitary ware, at Camden, N. J., in which business he was actively engaged at the time of his death. He leaves a widow, two sons and one daughter.

The Norwich Nickel & Brass Company have been incorporated at Norwich, Conn., with a capital of $15,000, of which $3000 is paid in. The incorporators are William A. Aiken, Eliza C. Aiken, William B. Aiken, Alfred L. Aiken and Edwin A. Tracy.

Charles A. Kinney, the New England representative of Clark & Howard, at Mexico, N. Y., has sold a Safety Engine and Boiler to William B. Cashen and James T. Kay, plumbers, of Meriden, Conn., to run three pipe machines. The boiler is so constructed that it may be used for either steam or hot water heating.

Thomas McBride of the plumbing firm of E. & T. McBride, Portland, Maine, died recently at his residence at the age of 39 years.

W. T. Holton, Boothbay, Maine, is putting a Gurney Hot Water Heating System in the Post Office Building and the dwelling of W. Morrison.

W C. Joy, 152 Centre street, New York, manager of the Titusville Iron Company, Titusville, Pa., informs us that the company made during the month of October one-third more Radiators than they had ever made in any one month heretofore. They have recently shipped three carloads of Radiators to such widely separated points as Portland, Ore.; San Francisco, Cal., and London, England. Their Zenith Radiators were used in refitting Marlborough House, the London residence of the Prince of Wales.

C. F. Gessert, 42 Dey street, New York, is handling promptly the orders for Radiators which the heating contractor places with him, and he exhibits a fine line to select from.

The Gorton & Lidgerwood Company, 96 Liberty street, are exploiting their Gorton Wrought Iron Side Feed Boilers for hard or soft coal on a new line. They have a fine collection of "long service" testimonial letters from those who have used the Gorton boiler for a dozen or more years with no expense for repairs.

The H. B. Smith Company, 133 Centre street, New York, have now on their sample floor one of the new large size No. 3 Mercer Boilers, fitted for steam, among other attractions to the heating contractor.

The Calcium Carbide used in the generation of acetylene gas is manufactured by the Acetylene Light, Heat & Power Company, Niagara Falls, N. Y.

Charles J. Gillis of the firm of Gillis & Geoghegan, heating contractors, 537 West Broadway, New York, who spent the summer abroad, discourses entertainingly on the methods of heating on the Continent. The heating of the best hotels in St. Petersburg, he says, is very primitive compared with the heating of such buildings here.

The Armstrong Mfg. Company, Bridgeport, Conn., and 139 Centre street, New York, report that their new No. 0 Pipe Machine has proven so popular as to have kept their plant running overtime to meet orders. They are making the threading tools that are used for threading the light interior-insulated tubing used for electric conduits.

An unusually large number of Wind Mills have been shipped recently from this country to Australia in response to orders, and it is believed by export houses that a good market for these goods is likely to be found there. There have been also some large shipments of Bathtubs to Australia lately.

The investigations which have been made in New York State as to the liability of natural gas being found have been rewarded with considerable success, and as a result companies are being formed and collections are being made to bear the expense of sinking gas wells in a territory covering a large section of the State. At Rome, N. Y., the gas wells have been utilized by the manufacturing companies for running their various plants. Men who have had experience in drilling for gas in Pennsylvania and Indiana are finding occupation in New York State. In many of the smaller towns, where a good flow of gas has followed the drilling, the effect has been beneficial to local industries. This has been a sufficient incentive to continue the search in other places, and from the accounts coming in it may be assumed that the labor has been attended with success.

The Smith & Anthony Company, proprietors of the Sanitas Mfg. Company, 48-54 Union street, Boston, Mass., are enjoying an excellent demand for their Sanitas Closet Range, a ventilating closet with a series of seats operated automatically from one tank, which has been on the market but a short time. A number of these closets have been placed in Bowdoin College, Brunswick, in a school at Lewiston and various other places in Maine. One hundred and twenty-five are placed in schools in Hartford,

Conn., and the company have orders for 46 more in Providence and Chicopee, Mass. They are also placing them in Amherst and elsewhere in New England, besides having sold them for use in a school at Plainfield, N. J. George W. Knapp, who is with the Smith & Anthony Company, speaks in the most enthusiastic terms of this sanitary device, and as he is thoroughly conversant with all forms of closets and waste disposal apparatus, he is in a position to back up his opinion with persuading arguments.

A recent issue of an English journal describes a new system of hot water heating introduced by Cope, Allman & Co., Birmingham, England. The description is very inadequate, but it appears, however, to be a system in which the water is heated by a steam jet from a neighboring steam boiler and the circulation is effected by the pressure of the steam. The water, it is claimed, can be circulated any required speed from 300 feet upward per minute. Among the advantages claimed are a saving of one-third in fuel and the rapidity with which a large building may be heated. The pipes may be placed over or under doors or any obstacles, and may be twisted in any desired form without interfering with the circulation, and the apparatus will work with as low as 10 pounds pressure of steam.

M. E. Monash of the Monash-Younker Company, Chicago, has been spending a few days at their New York office at 96 Centre street. He reports a growing trade for the Star Couplers among the steam and hot water heating trade. The Couplers are used for making a connection with house water service to supply the boilers. With these Couplers the pipe fitter can readily do the work.

Fred. J. O'Brien has purchased the plumbing business of Charles E. Wills on lower Second avenue, Lansingburg, N. Y.

Plumbers' licenses have been granted to H. E. Blaisdell, W. M. Debet and Thos. Lydon of Berlin, N. H.

The Polaski Block, Alma, Mich., has just been completed and accepted. The plumbing was done by Brown Bros. and the galvanized iron work by J C. Albright of Saginaw, Mich.

In a communication from the International Radiator Mfg. Company, Cheektowaga, N. Y., they announce the resignation of C. E. Safford, who was formerly president of the company. At a meeting of the company, held at the works at Cheektowaga, November 6, 1897, the following officers were elected: S. M. York, Cleveland, Ohio, president; Fred. D. Johnson, New York City, vice-president; John W. Fisher, Buffalo, secretary, and F. D. Gridley, Buffalo, treasurer. The company have now finished and ready for shipment a new Radiator, exposing 5½ feet per loop, with 2½-inch centers, decorated in the Empire style, and are shipping samples to some of their trade. Their general sales agents, Fred. D. Johnson & Co., 80 Centre street, New Yory City, will quote the trade prices on application.

John H. Welteroth, a well-known contractor and plumber of Williamsport, Pa., figured in a hunting adventure last week that will make him envied by many ambitious Nimrods. Accompanied by H. B. Fries he went to Laurel Hill on a hunting expedition and the second day brought an unexpected adventure in the shape of a 200-pound bear, which, according to all accounts, made itself decidedly disagreeable and would shortly have proved responsible for a coroner's inquest had it not been for some well directed shots from Mr. Welteroth's rifle, which stopped its career. Mr. Welteroth, it appears, was unprepared for the attack, and had it not been for the fact that his companion fired a charge of bird shot into the bear and distracted its attention the attack might have proved serious. An illustration in one of the Williamsport papers, which does not purport to have been made from a photograph taken on the spot, presents an exciting situation, but hardly a flattering portrait of the hunters engaged.

The interests of T. W. Fritts & Co. and Tom Fritts Hardware Company, Chattanooga, Tenn., have been consolidated under the latter style, and the business will be continued at the old stores, 819 Broad and 721 Market streets. A wholesale as well as retail trade is done in Shelf and Heavy Hardware, Agricultural Implements, Sporting Goods, Mill Mine, Railroad and Plumbers' Supplies, Harness, &c. The company expect to occupy a new storeroom on Market street by April of next year. The building will comprise four stories and basement, 24 feet wide by 200 feet in length, and will be fitted up in the most approved fashion.

The Metal Worker is indebted to the Paterson, N. J., Master Plumbers' Association and the courtesy of the secretary, John Campbell, for an invitation to be present at the "smoker" of the association, to be held at the close of the State Convention on Wednesday, November 17, in Helvetia Hall, 56 Van Houten street. The invitation gives the names of the officers and members of the association.

S. H. Woodbury & Co. of Brewer, Maine, have been licensed under the Bangor laws as plumbers.

Runyan Brothers, New Castle, Ind., have moved their plumbing shop from the room on East Broad street to the basement of L. A. Jennings' hardware store.

The American Boiler Company, Chicago, have enjoyed some good orders recently, among them being one for a full carload of boilers to go to a Western city. Their business is now, however, showing some signs of the usual tapering off with the approach of winter.

Expanded Metal in Pavement Work.—In San Francisco, Cal., a paving material consisting of steel and concrete in combination is being laid in some of the principal streets which is expected to give the best results. Expanded metal is the form in which the steel is used. The earth of the street is then graded into shape and covered with a bed of sand. On this sand is laid the sheet of expanded steel. Over the steel is then laid a layer of concrete. The concrete is stamped into the meshes of the metal, forming a perfect bond. This makes a foundation that will never give way. Upon it can be laid asphalt, bituminous rock, basalt blocks, wood blocks, brick or any kind of surface pavement desired, the permanency of the entire pavement depending entirely upon the character of the top work.

The Pittsburgh Reduction Company, manufacturers of aluminum from the ore, have appointed C. Sidney Shepard & Co., 23 and 25 Randolph street, Chicago, agents for the sale of their products. These consist of aluminum in ingots for remelting, aluminum alloys, castings, rods, wire, bars, shapes, sheets, plates, seamless tubing, &c. The company have closed up their Chicago branch, in which they formerly carried large stocks. The acquisition of this business gives the house of C. Sidney Shepard & Co. more prestige than ever in the metal trade. They have always been prominent in this line, but the addition of aluminum, as representatives of the producers, greatly increases their importance. They have just issued an aluminum price-list, which they will be pleased to furnish on application.

A Boston engraver, Joseph D. Young by name, has engraved the whole of the Lord's Prayer on the head of an ordinary pin. The lettering starts on the edge of the pin head and circles round in a spiral until it finishes in the center. Seen through a powerful magnifying glass the letters are said to be as distinct as the type of a newspaper, showing surprising delicacy of touch on the part of the author.

The total miles of telegraph wire in the world is estimated to have reached 4,908,921, not counting 180,440 miles of submarine cable. Were this all in one continuous line it would wrap around the equator about 198 times. The moon and earth could be connected by 20 lines, with enough to spare to connect every country on the earth. Of the total amount, Europe has 1,764,790; Asia, 310,685; Africa, 99,419; Australia, 217,479, and America, 2,516,548.

Probably the most novel feature of the Trans-Mississippi and International Exposition, to be opened at Omaha, Neb., on June 1, 1898, will be the "Sherman's Umbrella," a mechanical invention by which passengers will be elevated to a hight of 300 feet and revolved slowly within a circle of 250 feet diameter. The "umbrella" will exceed in hight the celebrated Ferris wheel.

Washington Hardware Company, 928 Pacific avenue, Tacoma, Wash., who are making a specialty of Alaska outfitting, are issuing with their compliments Gascon's map of the gold fields of Alaska, showing the latest discoveries, the new passes, proposed railroad route and supplying other information on the subject. They also send out a circular giving a copy of the laws that govern placer mining on the Yukon River, and full information as to nature and size of claims, the forms of assignment, applications for grants, &c. Besides their regular stock the company are carrying a full line of Prospectors' and Mining Tools and Boat Builders' Supplies.

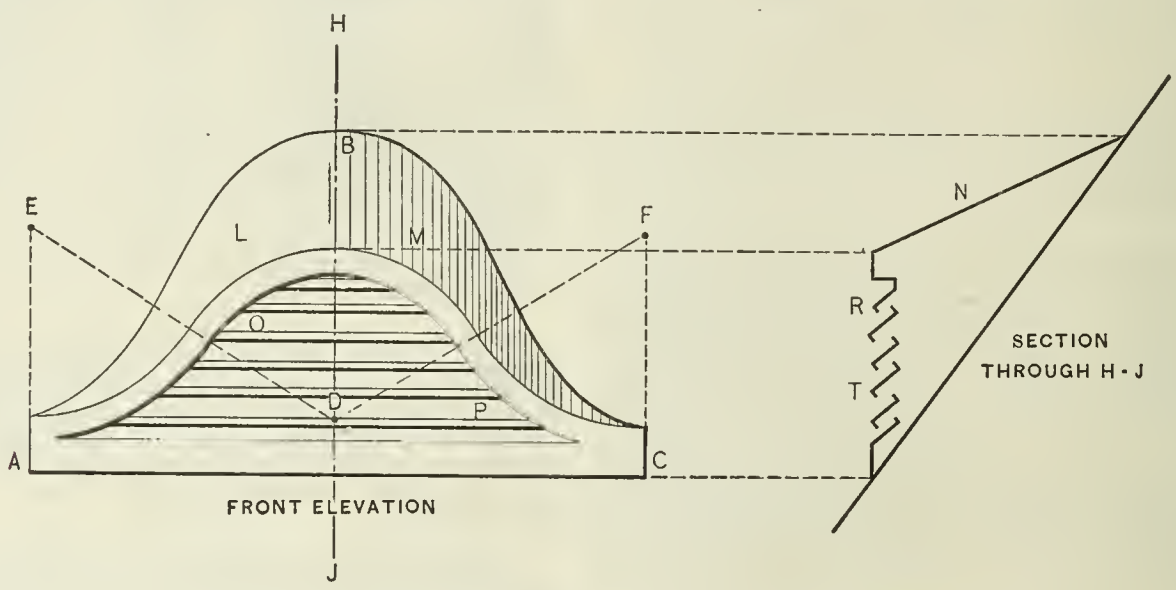
Major Moses P. Handy, commissioner-in-chief for the United States to the Paris Exposition of 1900, has obtained 200,000 square feet of space for American exhibits in the engineering and machinery line. From present indications Major Handy looks for a very large and representative collection of exhibits from this country. He regards the opportunity offered by the forthcoming exposition as the most favorable that has yet been afforded to the manufacturers of America for the extension of their trade in Europe and the countries of the Orient.

SHEET METAL WORK.

PATTERNS FOR AN EYEBROW VENTILATOR.

A correspondent, writing for the patterns for an eyebrow ventilator, says : Please let me know how to cut the patterns of an eyebrow ventilator on a pitched roof, a sketch being shown in Fig. 1. In this view A B C represents the front elevation of the ventilator, the arcs being struck from the center points D, E and F. A section taken on the line H J in elevation is shown at the right, L M shows the roof of the ventilator represented in section by N, while the louvers are shown in elevation by O P and in section by R T.

Let A B C, in Fig. 2, represent one-half the elevation of the ventilator, and E F G a side view, of which E G is the line of the ventilator, E F that of the roof and G F the line of the pitched roof against which the ventilator is required to miter. The front and side views being placed in their proper relative positions, the first step is to obtain



Patterns for an Eyebrow Ventilator.—Fig. 1.—Elevation and Section.

sections on E G and G F. Trace a line through the points of intersections thus obtained ; then will P R S T represent one-half the pattern for the roof. For the pattern for the shape of the opening to be cut in the roof proceed as follows : Transfer the line G F with the various intersections thereon to any vertical line, U V, as shown by the small figures 1^6, 2^6, 3^6 4^6, &c. In similar manner transfer the line C B in front view with the various intersections thereon to the line Z Y, which is drawn at right angles to U V, as shown by the small figures 1, 2, 3, 4, &c. Now at right angles to U V and from the small figures in the same draw lines, which intersect with those of similar numbers drawn at right angles to Y Z. Trace a line through the points thus obtained; then will U X Y Z be one half the pattern for the shape of the opening to be cut into main roof.

For the patterns for the louvers or slats proceed as follows : Let A B C, in Fig. 3, represent a duplicate of a true section at right angles to E F, as follows : Divide the curve A to B into a number of equal spaces, as shown from 1 to 9. At right angles to A C or E G and from the small figures on A B draw lines intersecting E G in side view, as shown Then from these intersections and parallel to E F draw lines, intersecting the roof line G F at 1^5, 2^5, 3^5, 4^5, &c. Parallel to E F and from the point G draw any line indefinitely, as G H. At right angles to E F and from point E draw the line E H intersecting lines previously drawn at 1^1, 2^1, 3^1, 4^1, &c., as shown. Now take a duplicate of the line E H with the various intersections thereon and place it on the center line A C extended as K J.

At right angles to K J and from the small figures 1^2, 2^2, 3^2, &c., draw lines, which intersect with those of similar numbers drawn at right angles to C B, and from the points on the curve A B. Trace a line through the points of intersections thus obtained; then K L M J will be one half the true profile on the line E H in side view, and from which the stretchout will be obtained in the development of the pattern.

For the pattern for the roof of the ventilator proceed as follows : At right angles to E F in side view draw the line N O, upon which place the stretchout of one-half the true profile on line E H, as shown by the small figures 1^4, 2^4, 3^4, 4^4, &c. Then at right angles to N O and through the small figures draw lines, which intersect with those of similar numbers drawn at right angles to E F from inter. the inside opening of the ventilator shown in Fig. 2, and let 1 2 3 4 5 represent the sections of the louvers which will be placed in this opening. As the methods of obtaining the patterns for the louvers are alike, the pattern for louvre No. 4 will illustrate the principles employed. Number the various bends of the louver, as shown by points 6, 7, 8 and 9. At right angles to A C and from these points draw lines intersecting the curve A B at 6^1, 7^1, 4^1, 8^1, 9^1. On A C extended as E D place the stretchout of the louver No. 4, as shown by the small figures on D E. Since the miter line is a curve it will be necessary to introduce intermediate points between 7 and 8 of the profile in order to obtain this curve in the pattern. In the present instance the point marked 4 has been added. Now at right angles to D E and through the small figures draw lines, which intersect with those of similar numbers drawn parallel to A C from intersections 6^1, 7^1, &c., on the curve A B. Trace a line through points thus obtained, and F K J H will be one half the pattern for louver No. 4.

FLASHINGS.

Quite recently J. M. Robinson & Co., Cincinnati, Ohio, have added several improvements to and increased the power and strength of their 10 and 12 foot V-Crimping and Corrugating Machines used for pressing sheet metal in 10 and 12 foot lengths into various forms for architectural iron work. The improved machine will press 2½-inch pitch by ⅝-inch deep corrugations into No. 8 gauge gal-

vanized sheet iron, or No. 16 gauge with 3-inch pitch by 1-inch deep corrugations, in sheets 10 and 12 feet long. The finished sheets, the company state, are true without a curvature, and will lie flat on the floor without pressure, the value of which will be appreciated by all manufacturers of sheet metal roofing, siding and ceiling. The same machine will press three or four sheets at a time of lighter gauges, and will press weather boarding, skylight bars, brick siding and roll capping. Recent demands have been made for heavy gauge material for use in architectural work, and Messrs. Robinson & Co. have in consequence brought out the above named improvements, thus enabling their patrons to comply with all demands for light and heavy gauge sheet iron formations.

Orders for Galvanized Sheets from South America are still going in large volume to England. The British makers' quotations are said to be about 7½ per cent. below the figures obtained from the United States. A great deal of Galvanized Corrugated Iron is being used for building purposes on the Southern Continent.

John Schwing, Bridgeport, Conn., is getting out the copper cornices, dormer windows and skylights for the Pequonnock Bank Building. He also has the contract for the copper work on the boiler house, cottage and potting house of John T. Williams at Glenbrook, cornice work for C Swartz's building in South Norwalk and skylights for M. Flaherty's new block in Derby and the Jackson photograph gallery in Norwalk.

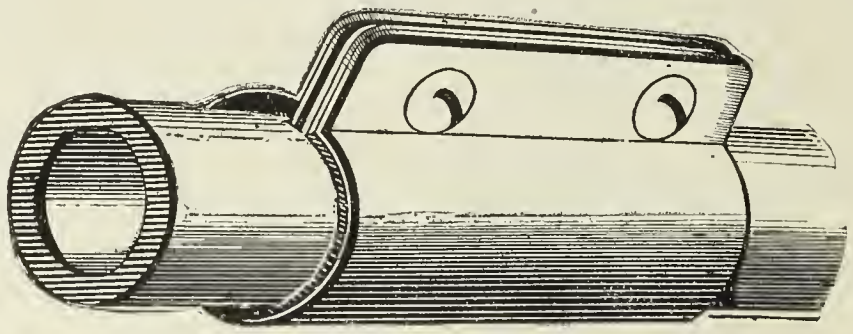
Articles of incorporation of the Art Metal Relief Company have been filed with the County Clerk of Covington, Ky. The incorporators are John G. Meyer, John Weitzel and Richard Kabitzch, the capital stock being $5000.

Judge Grosscup of the Federal Court in Chicago has rendered a decision holding the World's Columbian Exposition Company responsible for the losses to the French Republic and French exhibitors by reason of the fire which took place on January 8, 1894.

THE RETAIL STORE.

Smith's Pipe Patch.

Kenmore Mfg. Company, 75 Chambers street, New York, are marketing Smith's pipe patch, here illustrated. It consists of a plate of zinc, formed as shown in the cut, having a double thickness where the round head stove bolts clamp the parts together. Inside the tube is a piece

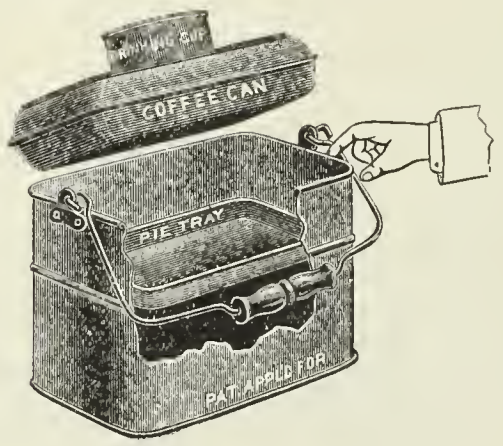


Smith's Pipe Patch.

of rubber packing to insure a tight joint. This device is designed for repairing sudden leaks in lead pipe by any individual without the use of solder, by simply opening the patch wide enough to receive the pipe and then screwing until tight. The goods are supplied in ⅜, ½, ⅝, ¾ and 1 inch sizes.

Granite Steel Dinner Pail.

Herewith appears an illustration of the new Granite steel dinner pail just brought out by Kieckhefer Brothers Company, Milwaukee, Wis. The illustration represents the side of the pail broken away, disclosing the interior arrangement. A prominent feature of this pail, aside from the fact that it is made of the company's Granite steel ware, is the reversible cover. This cover forms the coffee receptacle and has a drinking cup on top. The pail is constructed so as to act as a spring in holding the cover in place when put in the pail. The cover can be reversed, so



Granite Steel Dinner Pail.

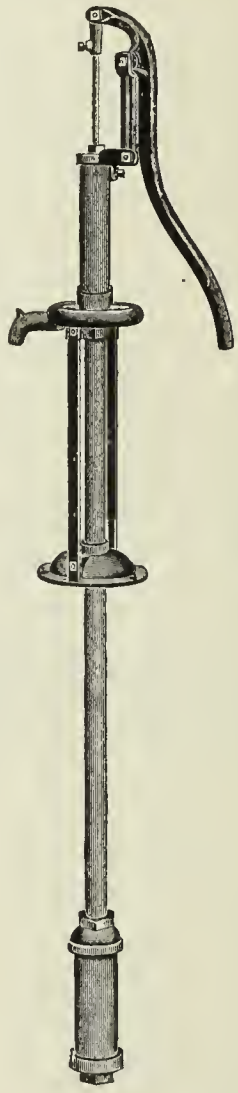
that the drinking cup will be under it and concealed from observation. Three sizes are made, consisting of small, medium and large sized pails.

Matthai, Ingram & Co., Baltimore, Md., are now engaged in the erection of a large addition to their plant. The new structure will be six stories high, 55 feet wide and 300 feet long on Ohio avenue, with an ell extension of 40 feet, making a total length of 340 feet. With this enlargement their factory, which occupies almost two city blocks, will have a floor space of over 11 acres. The new premises are designed to furnish increased shipping facilities and will also be devoted to the manufacture of some new goods which the company are intending to put on the market.

Louis Fontenot, dealing in Stoves and Tinware at Crowley, La., has recently moved his establishment to Parkerson avenue, between Stagg Brothers and the Hincliffe Building, where he will be more centrally located.

The Rainbow Pump.

An illustration is herewith given of a new pump brought out by the Moline Pump Company Moline, Ill. and named the Rainbow. It is a single acting pump, which, it is stated, throws as perfect a continuous stream as any double acting pump. The company claim to have been the first to succeed in accomplishing this feat, which has been often attempted by pump manufacturers. The base is adjustable. The finish is a departure from the old colors and very attractive. It is made with 2½, 2¾



The Rainbow Pump.

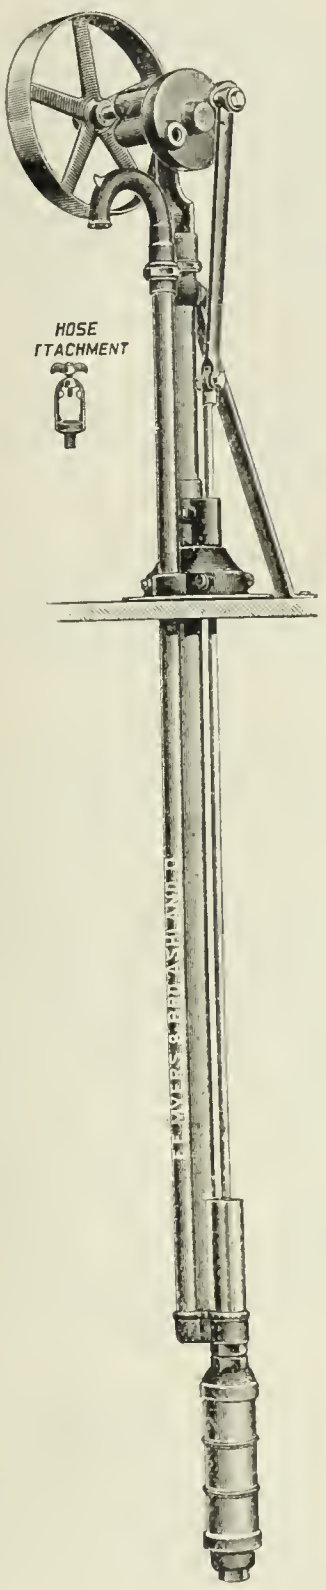
and 3 inch cylinders, all having 1¼-inch suction and 7-inch stroke.

A seasonable device is presented by the Cleveland Stamping & Tool Company, Cleveland, O., in the Lackawana Ash Sifter, which is illustrated in our advertising columns. It is designed to separate the coals from the

ashes in the ash pit of the furnace, so that dust is carried off by the draft. It is made in two sizes, and is said to be adapted for all kinds of furnaces.

Dairy and Factory Pump.

F. E. Myers & Bro., Ashland, Ohio, are introducing for dairy and factory purposes a pump, as here illustrated. It is referred to as light and back geared 2½ to 1, being



Force Pump for Dairy and Factory.

constructed on the form of their branch pipe pumps. It is designed to operate in any well having a depth of from 10 to 200 feet, and has 4, 5½ and 7 inch stroke. The construction is said to be the very best throughout, and the pump is offered with the belief that it will fill a requirement that has not been met—viz., a force pump with great power, so adapted as to operate in almost any depth of well, and all self contained.

The Baldwin Refrigerator Company.

The Baldwin Refrigerator Company, Burlington, Vt., are sending out their 1898 catalogue of Refrigerators, which is a very complete and attractive volume, and exceeds in size and appearance any of their former issnes. A large assortment of sizes and styles is shown, covering some 110 varieties, and including Soft and Hard Wood Refrigerators for residences, apartment houses, restaurants, grocers, hotels, &c.; also Ice Chests and Boxes. A large line of Sideboard Refrigerators in a variety of handsome designs are included in the catalogue. Illustrations are given of special Refrigerators and Coolers, such as the company build for hotels.

Combined Anvil, Vise, Drill, Pipe Clamp and Grindstone.

The accompanying engravings show the combined anvil, vise, drill, pipe clamp and grindstone which J. W. Cregan, The Bourse. Philadelphia, is putting on the market. Fig 1. shows the device with the drill and pipe clamp attachment. When it is desired to use the grindstone the

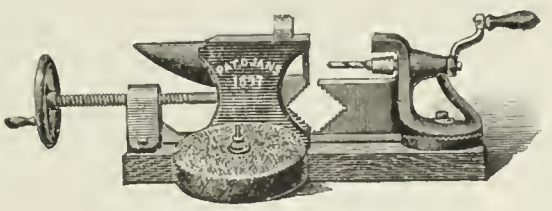


Fig. 1.—Combined Anvil, Vise, Drill, Pipe Clamp and Grindstone.

pipe clamp is easily withdrawn, as shown in Fig. 2. The drill is also easily removed when the pipe clamp is required for use. Fig. 2 shows the drill and pipe clamp detached and the grindstone in position and ready for use. When the tool is reqnired for boring heavy timbers, the back jaw or bearing end may be set to any desired angle, and is adapted for accommodating any size of auger bit. The device has been designed principally for the use

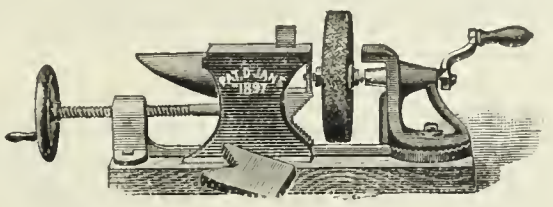

Fig 2.—The Grindstone in Use.

farmers and others frequently having odd repair jobs to execute and calling for the use of tools such as are found in this combination. The tool is neatly finished and painted with a dark varnish filler, and is made in two sizes weighing when crated 60 and 80 pounds respectively.

MEMORANDA.

Martin Bingman has opened a tin and general repair shop at Shelton, Wash.

J. E. Hutchinson has opened a tin shop at 710 First street, Hastings, Neb.

We regret to announce the death of James S. Hagerty, senior member of the firm of Keen & Hagerty of Baltimore, Md., the well-known manufacturers of Tinware. Mr. Hagerty died at his home in Baltimore on November 9 from a complication of diseases, after a comparatively brief illness, at the age of 68 years.

We are officially advised that the report that the business of the Wheeling Stamping Company, Wheeling, W. Va., manufacturers of Lanterns, Oil Cans and other metal specialties, and until June 1, 1897, known as the Nail City Stamping Company, will be consolidated with the business of a concern located in Bellaire, Ohio, is untrue. There is no intention of changing the present organization of the Wheeling Stamping Company.

John F. Weyand, wholesale and retail dealer in Hardware, Stoves, Tinware, Implements, &c., Pennsbnrg, Pa., expects soon to take possession of his new store.

J. D. Russ, retailer of Hardware, Stoves, &c., Rawson, Ohio, will remove to Arlington in the spring.

Opp & Davis have opened a new Hardware store at Weiser, Idaho. They are carrying a line of Heavy and Shelf Hardware, Stoves, Tinware, Agricultural Implements and Sporting Goods.

Huss & Batis, Arenzville, Ill., have opened up their new store and are now ready for business. They have added Stoves and Tinware to their former stock.

C. E. Krusen has sold out his Hardware business at Westfield, Pa., to F. E. Kinsman, formerly of Greene, N. Y. The stock comprises Hardware, Stoves, Tinware, Fishing Tackle, Guns, Paints and Oils.

C. H. Collins & Co. are a new firm at Le Sueur Centre, Minn. They are retailers of Shelf and Heavy Hardware, Tinware, Stoves, Agricultural Implements, Sporting Goods, &c.

TIN PLATES.

The American Tin Plate Company.

The magnitude of the works of the American Tin Plate Company, at Elwood, Ind., is forcibly indicated by the statement from official sources that the buildings for making tin plate placed end to end would extend 3100 feet. This only includes the black plate mills, tinning houses and their adjuncts, and excludes the new bar mill and a number of other buildings, which in themselves would form a plant of good size. In planning these works the managers of the company, with great forethought, made ample provision for the enlargement of each department if the growth of their trade would justify it. Their most sanguine expectations have been realized in this respect. Beginning with four hot mills, which was considered qnite a good plant at the time, they have enlarged in abont five years to 20 mills, with a daily product of about 250 tons of tin plates. This enlargement has been made, owing to the care taken with the original plans, without disturbing the symmetry of the works or the convenience of the initial relations of the several departments.

Demand for Ternes.

As bearing on the subject of the decline in the consumption of roofing plates, to which reference was made recently in these columns, the following observations by Charles S. Trench & Co. of New York in a recent circular are of interest:

The small demand for terne plates, less than last year and considerably below former years, has created some discussion. Many hold the opinion that the use of other materials and the character of buildings being erected indicate a change in the trade, but our investigations lead us to the opinion that the real cause is the continued stagnation in building operations in the smaller towns and country districts. Close investigation in three of the most important States, New York, Pennsylvania and Ohio, through a medium ot correspondence and travelers, has brought out the almost unanimous opinion that the falling off is due to the stagnation in the building trade, and this has been confirmed by the sellers of other roofing materials, whose experience in decreased sales has been identical with the tin plate trade.

SCRAP.

The Humbert Tin Plate Company's plant, at South Connellsville, Pa., is running steadily night and day, and is reported to have orders ahead until the coming spring at good prices. The difficulty experienced by many Tin Plate works in getting bars has not affected the company, as they have their steel bought to January 1 next.

A dispatch from Sharon, Pa., says that State Treasurer Haywood has donated a site for the proposed Tin Plate plant at that place and will become a stockholder in the company.

Commenting on the remarkable development of the American Tin Plate industry, as illustrated by the figures given in *The Metal Worker's* last quarterly lists, the London *Ironmonger* takes particular notice of the growing tendency in the United States for the manufacture of Tin Plates to be carried on in large plants and its combination with the manufacture of Bessemer or open hearth steel. This tendency, it believes, is bound to grow, seeing that the production of Tin Plates will provide an outlet for large quantities of steel which would otherwise be difficult to sell. In this plan our English contemporary sees a possible opportunity for the manufacturers of South Wales to preserve a large part of their declining trade, and it asks, Why do not some of the large Welsh steel works, such as Dowlais, Cyfarthfa, Ebbw Vale or Tredegar, go into this business and so preserve its old habitat?

At a recent meeting of the Welsh Tin Plate Workers' Union the president stated that 93 mills were working at reductions varying from 10 to 15 per cent., and 62 mills at promised reductions. The workmen at 154 mills had been asked to submit to reductions, but the employers had deferred the matter until after the council meeting. There were thus about 36 mills working on the list the workmen of which had not been approached by the employers for any reduction. The delegates finally agreed to the following resolution: "That, inasmuch as several leading works in the trade have given way to a reduction in wages, we propose that a reduction of not more than 15 per cent. off the 1874 list be submitted to in works where asked, to commence on November 1." It was then decided that a contribution of 2½ per cent. on all wages earned should be paid into the union funds, to support those works where more than 15 per cent. was demanded by the employers.

British exports of Black Plates for tinning in the nine months ended September 30, 1897, made a good showing, offsetting to some extent the decline in the exports of Tin Plates. They increased to 44,023 tons, as compared with 36,354 tons in the first three quarters of 1896, and 24,10 tons in 1895. Germany and Russia were the heaviest buyers.

The Neshannock Sheet & Tin Plate Company of New Castle, Pa., were granted articles of incorporation on November 4. The concern have a capital of $10,000 and the following directors: George W., William L. and C. H. Johnson and G. W. Hartman of New Castle and W. O. Kirkland of Beaver, Pa.

McGranahan & Faulkner, Wheeling, W. Va., have been awarded the contract for the erection of the new Tin Plate plant of the Laughlin Nail Company, Martin's Ferry, Ohio, and have begun preliminary work on the structure. The firm built the Tin Plate works of the La Belle Iron Works, at Wheeling.

The lease of the Stickney Iron Company's two-mill Tin Plate plant, at Baltimore, Md., by the Humbert Tin Plate Company, South Connellsville, Pa., is announced to have been definitely concluded. The lease runs for three years. The Stickney mills will probably be started up next week, and will be used to supply the local market.

The hammer shop of the Cumberland Steel & Tin Plate Company, Cumberland, Md., including the molding and blacksmithing departments, was totally destroyed by fire on Monday. The building was one story high, 100 x 55 feet, and contained four steel hammers and other machinery, besides a number of furnaces. About 25 men were employed in the building, but all had gone home. The other departments, however, were working at night, and when the alarm was given the employees, with the use of the fire fighting apparatus connected with the works, prevented the fire from spreading to the big mill only 15 feet away, which, if burned, would have been a loss of over $50,000. The loss is estimated at $10,000, and is fully covered by insurance.

The British Board of Trade returns place the total exports of Tin and Terne Plates from British ports to the United States in October, 1897, at 5036 tons, as against 4656 tons in the previous month and 10,590 tons in October, 1896. This makes the total exports of Welsh Tin Plate to this country in the first ten months of the current year 69,782 tons, a falling off of 31,341 tons as compared with the corresponding period last year.

The Totten & Hogg Iron & Steel Foundry Company of Pittsburgh, manufacturers of Rolling Mill Engines, Rolling Mills and Tin Plate Mills, have received an order from the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., to equip their plant with Freeman's Patent Furnace Charger for charging annealing furnaces.

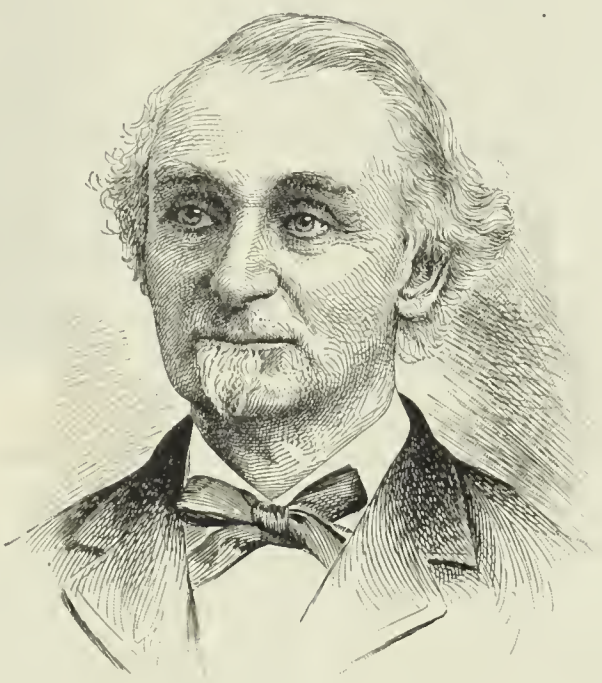
It is announced that the Atlanta Steel & Tin Plate Company of Atlanta, Ind., have decided to double the capacity of their plant. They have three hot mills at present. When the improvement is completed they will manufacture 2800 boxes of Tin Plate per week, and their monthly pay roll will be increased from $10,000 to $20,000.

A Washington dispatch states that the Government is now favorably considering the question of returning to the system of reciprocity in order to encourage our commercial relations with Canada. Mr. Kasson, who has been especially charged with the arrangement of reciprocity plans under the new Tariff act, is said to be in favor of such a course.

STOVE TRADE NOTES.

John Magee.

A wide circle of friends, both in and out of the stove trade, will learn with sorrow of the death of John Magee, which occurred at his home in Beverly, Mass., on Friday, November 5. He had been in poor health for several years and for some time past had been confined to his home on account of a stroke of apoplexy. He was widely known among the trade through his long connection with the Magee Furnace Company, and was in every way an example of New England probity and genius. Mr. Magee was born in St. Johns, New Brunswick, December 24, 1821. Before he was a year old his parents removed to Andover, Mass., where his boyhood was passed. His parents were poor and he was under the disagreeable but beneficial necessity of working from an early age in one of the large woolen mills of the place. At 16 he was advanced to the position of second foreman in one of the principal departments, but the business was evidently not suited to his taste, for about the time he became of age he left the mill and apprenticed himself to learn the tin, sheet iron working and plumbing trades. He made such progress that before the expiration of his term of apprenticeship he was given the foremanship of the entire shop. Later he established himself in the retail stove and plumbing business in Andover, and there he continued until he was 26 years old. At that time he started, in connection with a friend, a small woolen mill in Danvers. He remained in this business only about a year, and in 1849 went to California to search for gold. In 1852 he returned home and became superintendent of the tin and trimming department of the N. E. Glass Company of Cambridge. In 1854 he again started for himself in the retail stove and plumbing business in Lawrence, Mass., and at that time became desirous of making stoves, one which he invented being placed on the market in 1856 under the name of Diamond.



JOHN MAGEE.

For about five years Mr. Magee's stoves were manufactured for him, but in 1861 he was invited to become a partner in the concern which had made his castings. This he did and the firm were reorganized as the Norton Furnace Company. The principal foundry was at Norton, Mass., but part of the time another was run at Providence, R. I. In 1864 they began a foundry in Chelsea, Mass. The partnership formed in 1861 was dissolved in 1866, and in January, 1867, Mr. Magee started again with new associates, forming what was known as the Magee Furnace Company. His connection with the stove business always had to do with the practical part of it. For a long term of years he personally managed the work at the foundry, and gave his whole time to the production and improvement of stoves and furnaces. He took a very active personal interest in the production of the well-known Ideal stove, and found much pleasure and satisfaction in showing by a great variety of useful and ornamental art castings what beautiful results were possible in cast iron under good conditions and with good foundry management. Personally Mr. Magee was a man with rare charm, and the simplicity and sweetness in his character endeared him to all who knew him. During his whole connection with the stove business the idea of making money seemed to be furthest from his mind. He was determined that his goods should be fine in quality and superior in workmanship, and he was much more a manufacturer than a merchant. He was granted a large number of construction patents, besides a great many design patents, many of which have long since become public property and are now in general use, while others are exclusively employed by the Magee Furnace Company. Mr. Magee leaves two sons, Frank A. of Wenham and John of Chelsea. The funeral took place Monday noon at his home on Ober street.

William L. Bridgeford.

The stove trade of the country will learn with regret of the sudden death of William L. Bridgeford, which occurred at his residence in Louisville, Ky., on the morning of Wednesday, November 3, the trouble being an affection of the heart. About six weeks ago Mr. Bridgeford was attacked with a mild form of heart trouble, but for the first few days his condition was not regarded as critical. Pneumonia later developed, but he rallied and continued to improve until he was thought to be convalescent until Wednesday morning, when his condition suddenly changed for the worse.

Mr. Bridgeford, who was the senior member of the well-known stove manufacturing concern of Bridgeford & Co., was born in Louisville in 1847. His father, James Bridgeford, was the founder of the firm of Bridgeford & Co. and a man prominently identified with the business interests of Louisville for a period of over 40 years, being noted as a banker as well as a manufacturer. The son, William, entered his father's employ and by close attention to business soon raised himself to a position of importance, and for several years before his father's death, which occurred about ten years ago, was practically the head of the concern. The business, with other properties pertaining to Mr. Bridgeford, Sr., afterward passed into the control of the Fidelity Trust Company to be distributed among the several heirs, and when the stove plant was offered for sale it was purchased by William L. Bridgeford. He immediately reorganized the company, associating with him C. W. Adams of Somerset, Ky., and George Ogle, who for 30 years had been foreman of the tinning department. Mr. Bridgeford was a graduate of an American college and afterward went to Heidelberg, Germany, where he took a special course. He leaves a widow and four children.

The Weir Stove Company, Taunton, Mass., show a great deal of originality and good taste in the advertisements which they prepare and distribute widely in the local press in New England and through other publications. The firm for some years have had their own printing office, with two presses and a full assortment of standard and display types, where they prepare a vast amount of printed matter that serves to keep the Glenwood Stoves

and Ranges prominently before the public. The wording of the advertisements and the striking manner in which they are displayed are the result of R. H. Babbitt's genius in this direction.

PHILADELPHIA STOVE TRADE.

There is quite a steady movement of goods from the warehouses, and while individual orders are not of a bulky character there are enough of them to make the volume of business large. A bright feature of the trade is its steadiness in the absence of anything approaching cold weather. Already the amount of business done greatly exceeds the figures reached at this stage of the season last year, and there is every indication that the total business for the season of 1897-98 will equal and perhaps exceed that of 1895.

The demand for cast iron heating goods is, on the whole, satisfactory. The heavy demand for tamale stoves has, as might be imagined, affected to some extent the movement of cast iron heating goods and dealers are consequently placing orders for coal stoves for regular requirements somewhat cautiously. In view of the improved condition of the industrial classes, however, business in coal goods is expected to even up later on and leave little room for complaint.

Cooking goods are in active demand, but makers complain very much in regard to the low prices obtained. More particularly is this the case with shipments to the Southern market, where some lively competition is offered by Western houses. A sale recently reported as made by a Western concern, and occasioning much comment in this market, was one of a carload of cook stoves, of up to date style and attractive design, weighing, it is said, 130 pounds, well finished and desirable goods in every way, which were laid down at a point in Georgia at a cost to the buyer of $2.73 each. A similar stove had previously been sold in the same territory at a figure in the neighborhood of $4 85, laid down. Allowing for freight at an extremely low rate, these stoves must have left the factory at an invoice price of less than 2¼ cents per pound. Founders look upon the transaction as an example of extraordinary price cutting, and dealers who have heard of it naturally wonder where their profit is to come in on cook stoves to be handled in the future at such a low basis of cost. It is to be hoped for the sake of the trade that the shipment mentioned will not be duplicated unless at a profitable price, as 2¼ cents per pound for a finished cook stove is a price bordering upon the ridiculous.

The furnace trade is brisk. While the orders coming in from building operations are few, the business aggregating from individual householders installing new heating apparatus is large and increasing.

There is much complaint in regard to collections, which are reported to be exceedingly slow.

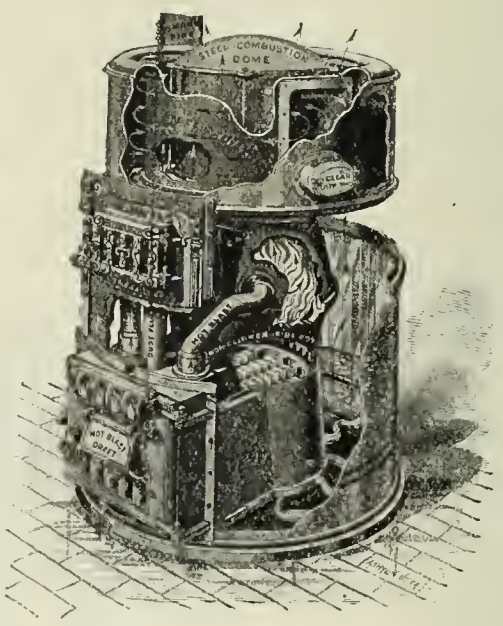
The Buckwalter Stove Company,

Royersford, Pa., are sending out new circulars covering some of their furnaces. The company claim to make a greater variety of styles of furnaces than any other maker in their State, and to have styles to suit all conditions at a wide range of prices. One circular describes the Eclipse, one of their leaders, a very heavy gas and dust tight furnace for hard or soft coal, powerful and self cleaning, special check damper and dust flue, and triplex grate ; another describes the Eclipse Duplex, said to possess more radiating surface than any other heater and to be the only furnace made with three radiating drums ; a third describes the Eclipse Junior, a low priced furnace in five sizes, having an inner dome made in a single piece casting, thus combining gas and dust tight construction with ample radiating surface, and adapted for burning hard or soft coal ; a fourth circular describes the Storm, a drum furnace in three sizes, with ten steel air pipes running through the drum, and the drum so designed that it can be mounted to make the furnace suit low collars. The company have studied the requirements of furnace dealers and users to an extent which has been much appreciated, and are consequently enjoying an increased demand for their products.

James Spear, a well-known Stove manufacturer of Philadelphia, Pa., says: " It is a singular thing that many architects and builders do not understand the construction of chimneys. Many of them plan a flue which is but a few square inches in size to carry away smoke from an open fire place whose dimensions may be a yard or more. It doesn't take a very bright mind to understand that when the smoke from a roomy fire place rolls up against a flue which is only a few inches square it is not all going up the chimney. Part of it is bound to be rolled back, and yet year after year houses are constructed with chimneys built in this fashion, and they often have to be torn out and reconstructed. A good chimney is one of the most necessary requisites of a dwelling, and too much care and thought cannot be given to its construction."

The New Superior Hot Blast Furnace.

A hot blast warm air heater which is especially adapted for burning soft coal has just been brought out under the name of New Superior by the Superior Foundry Company of Little Falls, N. Y. This heater, we understand, has been developed after two years of experimentation with soft coal, and the principal feature in its construction is the provision for "injecting into the combustion chamber above the fire pot a large volume of highly heated oxygen, which, mingling with the nitrogen gases, sulphur, tar and smoke arising from the fresh coal supplied, thoroughly ignites and consumes these gases, thus insuring a perfect combustion and coking the coal, which presents all the advantages of a hard coal fire." The New Superior embodies among other features a cast shield front, extra deep ash pit, non-clinker fire pot cast in two sections and fitted with Superior flat shaking and dumping grate, extra heavy cast iron dome, steel combustion chamber with large radiating surfaces, large ash pit door and mica rake off, with the company's new positive dust escape. The furnace castings are made extra heavy and the parts are carefully mounted, fitted and inspected before shipment. The New Superior is made in five sizes, having a diameter of grate ranging from 15 to 22 inches and diameter of fire pot ranging from 17 to 30 inches. The hight of the furnace ranges from 42 to 62 inches and the square feet of radiating surface from 36 to 78 inches, with a heating capacity stated to be from 10,000 to 60,000 cubic feet. The illustration of the heater which we present herewith shows it with the outer casing removed and some of the parts broken away, indicating the interior construction and the course of the air currents.

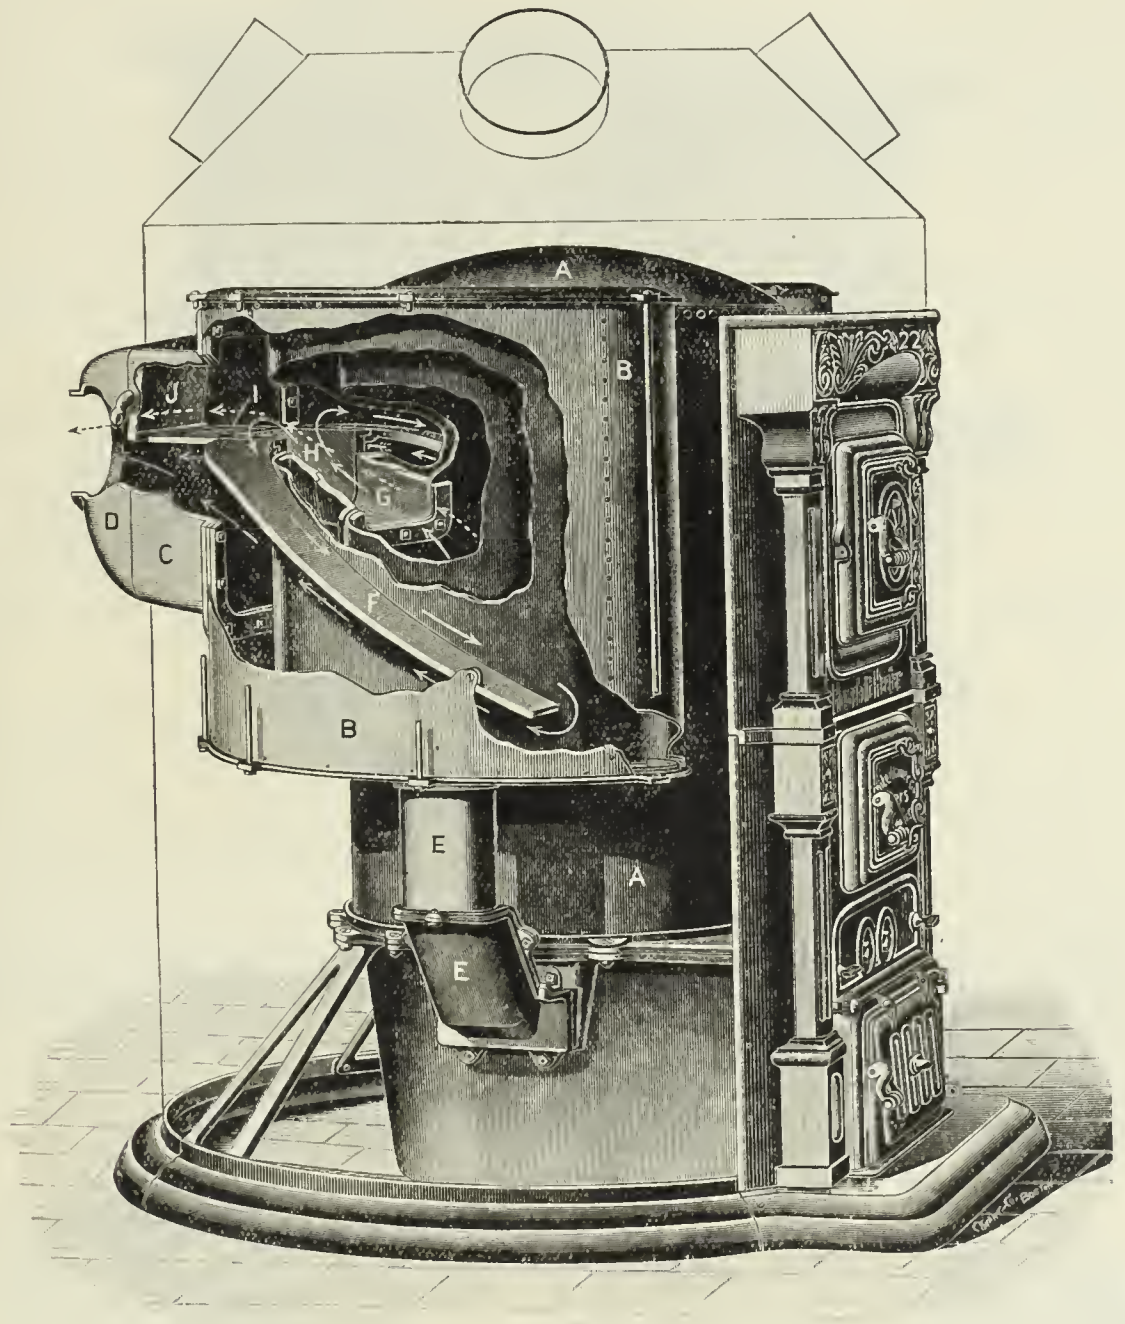


New Superior Hot Blast Furnace.

The Charter Oak Stove & Range Company, St. Louis, Mo., are in receipt of a somewhat unusual testimonial letter from J. T. Strother, Waco, Texas, who informs the company that he is using a Charter Oak Cook Stove which he bought in 1867, and that it has been fired up three times a day since that time to cook for a family varying from 6 to 20 in number. The Stove, which is of the pattern of 1853, improved in 1859, had been in use for one year before Mr. Strother bought it, so that its total life up to date is 31 years. Mr. Strother ends his letter thus : "Thirty-one years seems a long life for a Stove in active operation every day. But this Stove is, I believe, good for ten years to come. I shall name it in my will in connection with my youngest girl. The statements above given open the way for a little gratuitous advice, at which, I hope, under the circumstances you will take no offense. Advice : Cease making Stoves that last a lifetime, you'll ruin your business."

The Household Heater.

The engraving presented herewith is a broken view of a new hot air furnace known as the Household heater, manufactured and put on the market by the White, Warner Company, Taunton, Mass. H. A. Tinkham of the above firm has given a great deal of thought to the design and construction of this furnace, and the result is what he believes to be an unusually efficient and excellent form of heater. The main radiator A is described as made of the best quality of boiler iron with riveted gas tight joints. A particular feature of the heater is the auxiliary radiator B, which is referred to as something new in this style of furnace, adding greatly to its power. The manufacturers significantly state that it is made under Letters Patent No. 350,590, of which they are the sole owners for New England. Consulting the illustration it will be noted that in the auxiliary radiator is the deflecting plate F, which, when the direct damper J is closed, carries the products of combustion around this radiator in a downward course toward the front, then backward and rising to the outlet into the smoke pipe as shown by the arrows. The space between the radiators A and B furnishes a very efficient heating chamber, and with the other surfaces provides that all the cold air admitted to the furnace shall come in direct contact with hot surfaces. The clean out of the furnace is made large and roomy, so that all parts of the radiator can be reached by the opening in the back when the outside collar is removed. Another feature in the construction of this furnace which the makers allude to as entirely new and novel is the method of hanging the grate bars. By the method adopted they have done away with bolts, and yet allow the grate bars to be taken out and replaced in a few moments. This is accomplished by means of a cast hanger keyed in place by a pin, the hanger supporting the outer ends of the grate bars, two hangers swinging from either side being used for the entire grate. By simply removing the pin the hanger can be dropped and the bars can be taken out. Another detail to which attention is directed is the arrangement of the dust damper, which can be taken out and replaced by merely unscrewing a knob on the outside of the front, then placing the hand inside and removing the damper. The course of the products of combustion is clearly shown by the arrows in the engraving, the hot gases from the fire passing through the collar G connecting the fire chamber with the outer radiator. When the damper J is dropped the draft is direct to the chimney, and when raised it is thrown back and around through the radiator B. The plates G, H, I and F are made very heavy, and all except G and F can be taken out at the back when D is disconnected from C, which is readily done by taking out a couple of pins.



The Household Heater.—Broken View.

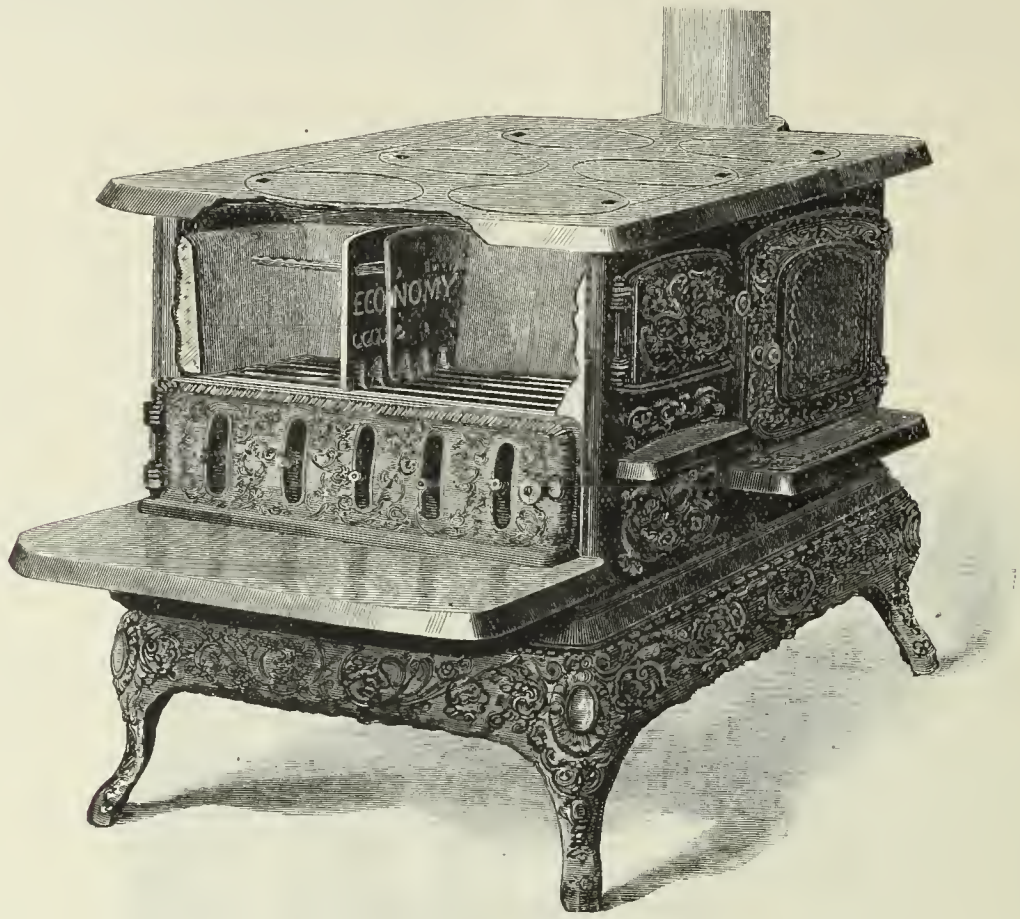
It will be seen, therefore, that in case of repairs the plates are easily accessible. The Household heater is made in a full line of sizes, and the manufacturers will be glad to furnish circulars giving dimensions, capacities and prices.

Good Western Trade.—Chicago stove houses report a much better trade since the opening of the month of November. Orders are much more numerous and shipments are hurried. Their collections have seldom, if ever, been better than at this time. Advices from Kansas City are to the effect that trade there is rushing, owing to colder weather.

The Detroit Furnace & Heater Company, Detroit, Mich., who have been building a new plant of largely increased capacity to take the place of the one lately destroyed by fire, will move into their new quarters on the 15th inst.

The Economy Adjustable Fire Box Partition.

A device for reducing the size of the fire chamber in cooking stoves for small work, or to do summer cooking, has been invented by W. G. Hamilton, Colorado Springs, Col., and is being offered for sale by Carleton M. Gilbert, whose address is P. O. Box 2490, New York City. A bro ken view of a stove is presented in Fig. 1, showing the Economy adjustable fire box partition in position. Fig. 2 is a general view of the partition and Fig. 3 is a sectional view. The partition consists of two cast iron plates so made as to be adjustable to the shape of the fire chambers of the various cooking stoves. The points at the lower edge of the partition are notched so that they may be readily broken off where they hinder the partition finding its natural resting place. In one part of the partition there is a slot, and in the other holes at the top through which a rod adjustable in length may be connected. In one plate there are a number of holes at the bottom which are designed to correspond with one of the holes in the other plate, so that it may be fastened by means of a stove bolt, as shown in Fig. 3, after the partition has been fitted to the fire chamber in which it is to be used. The rod used for holding the partition rigidly in place is provided with notches so that it may be broken off at the point desired. It is mentioned that the partition is adapted for use in all kinds of cooking stoves, and its application is so simple that it can be put in place by any one. It is further pointed out that a very material saving in fuel may be effected by the use of only a part of the fire chamber for light cooking, and that when there is no fire under one of the cooking holes there is sufficient heat radiated from the partition to boil water. It is specially adapted for summer use where the heat in the kitchen becomes intolerable if the entire fire chamber must be used.



The Economy Adjustable Fire Box Partition —Fig 1.—Broken View, Showing Partition in Place.

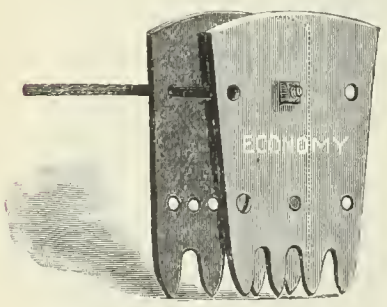


Fig. 2.—General View.

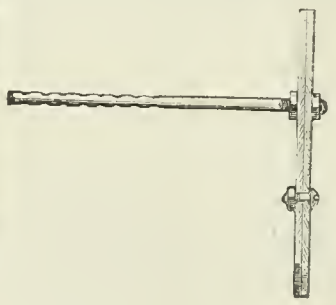

Fig. 3 —Sectional View.

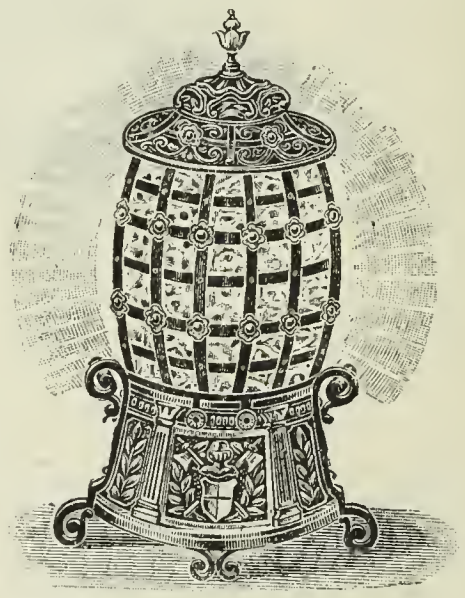
A Fire Basket Stove.

One of the forms of heating apparatus intended for use in halls, bedrooms, bathrooms, &c., which has recently been brought out by an English manufacturing concern, is what is known as a Fire Basket stove, a general view being presented in the accompanying illustration. This stove is constructed with a strong cast iron tank in one piece, and in the words of the manufacturers "is fitted with patent Tundish and filter, mica chimney, fluted ruby envelope, asbestos fire balls, wrought iron basket, polished copper rosettes, ornamental cast iron top and cast iron kettle rest." The tank has a capacity of 3½ pints, and it is stated that it will burn for six hours. The hight over all is 29 inches, and the width 18½ inches. The stove is fitted with the manufacturers' duplex central draft double 4¾ inch burners, constructed on the most approved principles, and which are said to be free from smoke or smell. They give a powerful heat, and the effect is that of a mass of glowing coals.



A Fire Basket Stove.

The Cook & Van Evera Company, Chicago, are distributing very pretty picture cards with descriptions of their Ranges and Stoves, printed on the reverse side. The goods to which attention is thus called are the Jersey

Steel Range. the Jersey "A" Cast Range, the Jersey "H" Cast Range, the Jersey "K" Cast Rangc, the Jersey "F" Cook Stove and the Jersey "G" Cook Stove. The Jersey trade-mark is quite a conspicuous feature of these cards.

ODD PLATES.

"The Comfort of Heating by Gas" is the title of a neat pamphlet issued by the Consolidated Gas Company of New York which shows by means of illustrations how Gas Grates, Gas Logs and Gas Radiators may be used for heating any room in a residence. It also shows Gas Water Heaters and apparatus in use for doing kitchen and laundry work.

The Schill Furnace & Range Works, Crestline, Ohio, although started in 1892, have repeatedly been compelled to enlarge their productive facilities, and the company attribute this to the fact that their productions have met the approval of the trade. The Centennial Exposition just closed at Nashville, Tenn., has awarded them a gold medal for the best Furnaces and Steel Ranges, together with diploma of honor for the best construction of Warm Air Furnace and Steel Range. The company have been compelled to increase their operative force by the addition of a score or more men by reason of the demand.

As one of the conveniences to their new plant the Detroit Furnace & Heater Company, Detroit, Mich., have asked the authorities to allow a railroad siding to be run to their buildings.

William N. Jarden succeeds to the Mantel and Grate business formerly carried on by Jarden, Young & Co., at 35 South Seventeenth street, Philadelphia.

The Eddy Electric Mfg. Company, Windsor, Conn., publish circulars illustrating and describing their Electroplating and Electrotyping Dynamos. These are shown by very fine half-tone engravings and full descriptive particulars are given in the circulars. The plating machines are made in four different sizes. All those who are interested in plating will do well to secure a copy of the circular, which will give them information about these high grade machines.

In the description of the Waste Heat Radiators made by the Waste Heat Radiator Company, Buffalo, N. Y., published in *The Metal Worker* of November 6, we were in error in stating that when they are adapted to a hot air furnace the air is either taken from the cellar cold air box or through a pipe from an opening in the room above. This statement was incorrect, for with the Waste Heat Radiators air is never taken from a cold air box, but always from the room or floor above.

The recent destruction by fire of the Bonnet-Nance Stove Company's works at Quincy, Ill., is stated to have been the fourth severe loss which has been visited on this plant. The first was the burning of the old works of Bonnet, Duffy & Co., many years since. The second was the wrecking of the works by a cyclone in 1881, and the third was a serious fire in 1882. The patterns recently destroyed were extremely valuable, being estimated to represent at least $50,000. The books and valuable papers were saved.

John G. Smith, a well-known citizen of Peekskill, N. Y., died after a lingering illness at his home, 62 Hudson avenue, on the afternoon of Friday, November 5, aged 51 years. He was born in the city of Buffalo, December 16, 1846, and went to Peekskill 27 years ago, where he has since resided. He was for a number of years employed in the mounting department of the National Stove Works.

The annual meeting of the Equity Protective Stove Association of the United States was held at the Troy House, Troy, N. Y., on Thursday, November 4. Among those present were William E. Hogan of Troy, C W. Curtis of Rochester, N. Y.; Charles S. Prizer, Reading, Pa.; B W. Kinney, Boston, Mass.; Nicholas Brayer, Rochester, N. Y.; William Smith, New York City; E. T. Anthony, Boston, Mass.; Henry Cribben, Chicago, Ill., and W. C. Higgins. Questions relating to the Stove business were discussed, and the annual election which took place resulted in the choice of Charles A. McLeod as president and E. T. Anthony of Boston as secretary and treasurer. The visitors were entertained and given luncheon at the Troy Club.

The Michigan Stove Company are distributing printed matter which is well calculated to arouse interest among Stove dealers in all parts of the country. The approach of Thanksgiving Day presents a most excellent opportunity for calling the attention of all housekeepers to the advantage of having good cooking apparatus for the purpose of furnishing their respective households with the finest meals of the year. It is "the time of times" to sell cooking Stoves and Ranges. Good living is associated with Thanksgiving Day as with no other day in the calendar. To assist Stove dealers in evolving plans by which to take advantage of this season, the Michigan Stove Company have prepared a large sheet on which they have reprinted from the trade papers a number of articles on this subject, giving practical suggestions relative to pre-Thanksgiving advertising. They also furnish a large brown paper poster on which a marking brush is cleverly imitated in advising the reader that "Thanksgiving turkeys should be cooked upon Garland Stoves and Ranges. Surprise your family by making a selection now." On another sheet they furnish prints of various sizes of their trade-mark, and offer to furnish the cuts free for local advertising.

NEWS AND NOTES.

The railroad freight rate war is so pronounced in the West that the traffic officials of the Western roads have given up all idea of having rates restored to a normal basis in the near future. They say that as long as there are so many roads operating outside the Joint Traffic Association there is little or no prospect of maintaining anything like uniformity in freight rates, and many are of the opinion that the only remedy for the present demoralization will be the passage of a pooling law by Congress at its next session.

Some time ago a law was enacted by the New York State Legislature requiring that all stone for State and municipal work, except paving blocks, should be worked, dressed and carved within the limits of the State, and that a clause to this effect must be inserted in all municipal and State contracts. The unions in the iron industry in the State of New York have now started a movement for the passage in the next Legislature of a similar law in the interests of the iron trades.

Secretary of the Navy Long has recommended the purchase by the Government of $1,000,000 worth of smokeless powder for reserve purposes.

M. Osiris, a well-known French philanthropist, has deposited at the Bank of France a sum of $20,000 as a prize for the exhibitor in the Paris Exposition of 1900 of the most meritorious work from an artistic, industrial or humanitarian point of view.

The Secretary of the Navy has declined to grant the request of the Columbian Iron Works of Baltimore, Md., that the contract requirement for speed in the case of the two torpedo boats now in their hands, the "Rogers" and the "Winslow," be reduced 2 knots per hour. The boats are now required to make at least 24½ knots per hour, and the department officials hold that this can be gotten from the craft as designed if the boats are properly handled.

So rapidly is the traffic increasing in the new railway line between Tien Tsin and Pekin, China, that it has been found imperative to put down an additional track.

It is reported that the London & Northwestern Railway Company of England have decided to cut a tunnel 10 miles long through the Shap Fells in the north of England in order to secure more rapid transit between England and Scotland.

A large new steel plant is being erected at Blizyn, Russia. It is expected to be ready for operation before the end of the year.

A dispatch from San Francisco, Cal., announces that Sumatra kerosene is likely to become an active competitor of the Russian and other oil in Japan. Recently a Yokohama firm ordered over 40 000 cases of Sumatra oil, and this is understood to be only the beginning of a business which is likely to be largely developed. The Sumatra oil is said to be quite as powerful as Russian kerosene, and the supply of it is believed to be practically inexhaustible.

An extraordinary showing is made by the Chicago, Burlington & Quincy Railroad Company, in reporting their earnings for September. As compared with September of last year their gross earnings increased $1,249,693, while their surplus over all expenses and charges increased $649,130. This system runs largely through the great corn belt. The improved condition of business is shown in the growing scarcity of good workmen. Employers of labor are finding increasing difficulty in securing all the men they need. The country is therefore at last utilizing its surplus human energy, which was a serious burden to carry during the depression.

The steamship "Milwaukee," which sailed from New Orleans on Monday for Liverpool, England, carried the largest cargo of cotton, and probably the largest general cargo, ever floated. It consisted of 23,850 bales of cotton, 30,200 bushels of corn, 38,818 pieces of staves and 2300 oars, the entire cargo occupying a space about equal to that of 500 freight cars, or a train measuring 3¼ miles in length.

TRADE REPORT.

METAL MARKET.

Pig Tin.—In wholesale prices there has been no wider fluctuation than 10c. per 100 lbs. during the entire week, and values at this writing stand almost exactly as they were a week ago. Speculation has remained dormant, and large dealers have operated in a very conservative way. Consumers and the out of town trade have taken quite their usual quantity of the metal, however, and thus prevented any burdensome accumulation in importers' hands. Jobbers' prices are unchanged for small lots from store, Straits Pig being quoted at about 14¾c. per lb.

Copper.—The position of the market is very much the same as it was a week ago. Sellers make some showing of indifference to the continued slackness of the demand, but orders are being competed for a little keenly, and none of remarkably full volume have been secured. In fact, both export and home trade buyers seem to be holding off at the moment, their near future wants being well covered. The restricted export trade is attributed in large measure to the engineers' strike in England. Retail business has not exceeded very moderate proportions and prices of small lots from stock remain at last week's level, namely, 12c. to 12¼c. per lb. for Lake Ingot and 11c. to 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—The demand for this material shows little activity. Orders are rather spasmodic and irregular and are mainly confined to supplying present requirements. Prices are not quite as firm as they were, although 15c. per lb., basis, is generally quoted by dealers for small quantities from stock.

Pig Lead.—Operations have been on a very moderate scale and the demand from all quarters is slow at the present time. The offerings, on the other hand, are fairly large. Wholesale prices have receded about 5c. on 100 lbs., owing to this more or less adverse condition of affairs, and jobbers have also reduced their quotations on small lots to 4⅛c. to 4⅜c. per lb.

St. Louis advices are as follows: Pig Lead metal is a trifle weaker than last reported. The decline in price is sympathetic to a certain extent, as stocks in both consumers' and producers' hands are extremely light, and any heavy buying would send the price rapidly upward. The largest consumer in this market is reported to be almost bare of stock, and it is stated is buying in a quiet way all the Lead that is offered. If this condition exists, and the straws seem to point that way, a higher range of prices must shortly ensue.

Lead Pipe and Sheet.—A good deal of complaint is heard among manufacturers and dealers in these materials of the dullness at present existing in the demand. Consumers are buying little beyond what they need for present use and that is quite moderate in total amount. Eastern manufacturers and dealers quote Lead Pipe at 6c. and Sheet Lead at 7c. per lb., subject to the customary discount.

Spelter.—The demand has been moderate and dealings were confined mostly to small lots for early delivery. Wholesale prices have varied to a slight extent only, but appear rather weaker. The combination of Western makers has been dissolved. This combination included some of the leading makers in the Kansas-Missouri and in the St. Louis districts, but did not embrace all of them, nor the works of the Chicago district. While it had a good deal of power, it did not have control at any time. In a retail way sales were of very ordinary type and jobbers' prices show no variation, good Western Spelter in small lots being quoted at 4 65c. to 4¾c. per lb.

St. Louis advices are as follows: The agreement among Spelter manufacturers having been discontinued, prices are less firm in consequence. Stocks are not heavy in either consumers' or producers' hands, and the general opinion among manufacturers is that while market may ease off a trifle no serious decline in prices is anticipated.

Antimony.—A quiet jobbing business of a steady character is reported. Prices are held quite steady at 8½c. to 8¾c. for Cookson's, 7¾c. to 8c. for Hallett's and 7¼c. to 7½c. for Japanese in small parcels from store.

Nickel.—Prices remain at about 38c. per lb. for small quantities.

Tin Plate.—Another disappointing week has been experienced in the Tin Plate trade. No improvement has taken place in the demand from any quarter, except for American makes for comparatively distant future delivery, in which some moderate sized orders were booked, though at a low range of prices. Spot business was of very meager proportions. The absence of activity in the demand has made the market somewhat unsettled, but the lightness of available stocks and the delay in deliveries by the mills have prevented any absolute break in prices. These, however, are as low as at any time, with no immediate indications of rising. The retail trade, locally, has been fairly active, but the call for Roofing Plates was much below the average for the season. Jobbers' quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates continue dull and quotations are merely nominal. The available stock of imported material is very narrow.

The following statistics published by Charles S. Trench & Co of New York, under date of November 11, 1897, are of considerable interest as bearing on the production and consumption of Tin Plate in the United States:

Tin Plate and Black Plate Statistics.

1896.

Imports.	Cwts.	Estimated American outfit. Cwts.	Total available supply. Cwts.
January	354,142	224,000	578,142
February	213,991	230,600	444,591
March	164,391	243,360	407,751
April	204,602	300,800	505,402
May	226,414	292,400	518,814
June	190,936	346,360	537,296
July	229,158	209,500	438,658
August	231,324	270,400	501,724
September	159,911	323,900	483,811
October	161,086	343,200	504,286
November	115,832	329,700	445,532
December	110,194	303,500	413,694
Total 1896	2,361,981	3,417,720	5,779,701

1897.

Imports.	Cwts.	Estimated American outfit. Cwts.	Total available supply. Cwts.
January	163,718	322,800	486,518
February	171,347	330,500	501,847
March	229,457	378,400	607,857
April	193 674	391,100	584,774
May	144,853	428,300	573.153
June	132,502	424,500	557,(02
July	140,887	273,000	413,887
August	104,478	392,800	497,278
September	82,800	455,500	538,300
Total January 1 to October 1, 1897	1,363,716	3,396,900	4,760,616
Total same period 1896	1,974,869	2,441,820	4,416,689

In regard to the above figures Trench & Co. remark as follows: "The Tin Plate trade has not yet shared in the revival in business noticed in other directions and prices are as low as at any time. The above statistics indicate only a slight increase in the consumption, and this increase seems to have been almost entirely Black Plates, and it is doubtful if the actual consumption of Tin Plates is any larger than last year. The pack of canned goods and the roofing trade have shown a smaller volume in 1897 than in 1896. The coming year promises to show a decided increase in the consumption, as the present high prices for canned goods caused by this year's short pack will undoubtedly lead to a heavy pack next season, while the use of Black Plate is certainly rapidly increasing."

A special London cable dispatch of November 10, 1897, reports on the British Tin Plate market as follows: Tin Plate is steady at about 9s. 6d., f.o.b., for ordinary Cokes and corresponding prices for other kinds. Makers are well engaged, and there is improved inquiry for both Bessemer and Siemens Cokes. The stock at Swansea is estimated at 109,000 boxes.

Sheet Iron.—The demand, except for certain gauges of thin Sheets, has fallen off to some extent and prices are hardly so well sustained as of late. The mills, however, are still considerably behind in deliveries on Black Sheets, and this fact helps to prevent any marked decline in prices. For prompt deliveries they continue firm, but some shading is being done on orders for future shipments. Galvanized Sheets are not in quite as active de

mand as Black Sheets and mill prices are a shade easier. Jobbers in this section quote small quantities from stock at 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: The demand for mill shipments is best in Black Sheets. Inquiries are being received from unexpected sources, which is rather surprising, as the season is now far advanced. Mills are still far behind in deliveries. The easier terms now prevailing may be attributed to cuts in freight rates rather than lower prices named by mills. Galvanized Sheets are not in such good shape as Black Sheets from manufacturers' standpoint. Jobbers are well supplied with contracts and new business for the mills is rather quiet. Consumers are having as much difficulty as ever in securing shipments from mills and stocks here in branch houses are very badly broken. Small lots from stock are quoted at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

THE IRON MARKET.

Conditions in the Iron trade, on the surface, have changed very little. The present and the near future are taking care of themselves very well and the plants are busy still with the very large orders taken some time since. But it is true that the amount of business in the order books is steadily diminishing, showing either that buyers are holding off for future delivery or that consumption itself has been declining.

The feeling in the trade is that to some extent the latter is the case, but it is not creating any alarm, since the conviction is still general that in 1898 we are to have a year of heavy consumption.

Those who have been hoping for a very substantial advance in prices—and in their hearts the great majority have harbored that feeling—are drifting toward the conclusion that there will be no boom, with its chances of extraordinary profits and its long trail of disappointments and losses. In fact, doubts are being expressed whether costs will go up quite as much as has been expected. There have been advances in wages, and it is pretty certain that there will be quite a general readjustment in that direction. Whether all will pass over smoothly in that respect with some important concerns remains to be seen.

The monthly blast furnace statistics of *The Iron Age* show that we are getting close to the maximum record of the close of the "soda water rise" of 1895, with a weekly output of 208,500 tons of Coke and Anthracite Pig Iron, an increase of 13,000 tons since October 1. In spite of this heavy production, stocks have declined 34,000 tons in October, thus showing that lately at least we were taking all we were making. There is very little reserve capacity left which could get started without much trouble in covering Ore and Fuel. Even if successful the best of the idle plants would find little temptation in the way of dividends at prices now prevailing.

The volume of new orders for Finished Iron and Steel has not been large. Southern furnaces have had a rather quiet week.

Pig Iron.—The New York market has been quiet, and in some instances founders who produce goods for which the season is now past are stopping shipments. The feeling is that the trade must now go through the usual dull spell of early winter, and that little activity need be expected before the new year is well opened. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

In the Philadelphia market, the indications of dullness noted a week ago appear to be confirmed, as buyers show very little disposition to do business. Prices are fairly steady and inside quoted rates are maintained, but the volume of business is much smaller than it has been and consumers are evidently waiting to see if they can get in on better terms before bidding for next year's deliveries. It is difficult to take any decided position in regard to values, although the general impression is that there will not be much change in either direction. Temporarily there may be a little weakening, but the final turn will necessarily be in accordance with the cost of production. Sales have been mostly in small and medium sized lots, but it is noticeable that deliveries are promptly called for, so that furnaces are tolerably free from accumulations. General quotations for seaboard deliveries are about as follows, with the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11; Bessemer, $12.25 to $12.75.

Southern sales agents in the Chicago market have had an exceedingly quiet week. They report that most of their customers have enough Iron under contract to cover their needs for some time into the future, and those who have not believe that they will lose nothing by deferring the making of contracts. Some grades of Southern Iron are very scarce, especially Soft Irons. The demand for local Iron has not been confined to small lots, but some good large contracts have been placed. The prices realized were fully up to our quotations, which is quite remarkable considering the lower quotations on Southern brands. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

There has been little done in Pig Iron in the Pittsburgh district during the week. Foundry Irons were specially quiet. We quote as follows, f.o.b. Pittsburgh: No. 1 Foundry, $11 to $11.25; No. 2, $10.50 to $10.75; No. 3, $10 to $10.25; Bessemer, $10.25 to $10.30.

The conditions in the Cincinnati market as outlined in last week's report remain practically unchanged. There has been no new business of consequence transacted in Pig Iron circles. A moderate, and perhaps normal, under the circumstances, run of small orders has continued and promises to hold unchanged for some time to come. The volume of inquiry is small and general conditions are very quiet. Consumption is good and furnaces and railroads are being continually urged to expedite shipments. Prices are nominally unchanged, and while furnaces are professing great strength and are admittedly in a strong position, yet it is a question as to how the market will open when the buyers again present themselves. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The St. Louis market is in about the same condition as last noted. Sales are not very good, mostly confined to carload lots for immediate delivery. There are no large buyers in the market and none are looked for until after the turn of the year. Stove works continue to be busy, but the season is drawing to a close and their requirements for the balance of the year are likely to be moderate. Prices are all maintained, and this, in the face of the liberal sales of warrant Irons at reduced prices, is a splendid indication that the market is in good shape. Stocks in the hands of furnaces are being rapidly depleted. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—The demand is subsiding and prices are lower. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3 75	....

THE HARDWARE TRADE.

The market shows little change in its general features since our last review. The volume of business is not very steady and uniform, but rather spasmodic and fluctuating, and on the whole perhaps slightly diminished. In some parts of the country, however, there is a good deal of activity, and the advent of cold weather has the effect of stimulating business, especially in winter goods. Prices are without material change, there being few fluctuations to report. The tone of the market is steady, prices being as a rule very well maintained, and in some lines there is evidence of strength, with something of a tendency to advance. In others there is a slight wavering. Reports from the different parts of the country indicate a gradual improvement in the condition of local business, there being promise of a marked increase in building and of renewed enterprise in many directions. It is anticipated that during the remainder of the year there will be a fair movement of goods considering the season, but the attention of the trade is turning more hopefully to the business of 1898. In the meantime both manufacturers and merchants are pretty well occupied, but, as is usual in the closing months of the year, attention is given to questions connected with business management and the policy to be pursued in the changing conditions and circumstances of trade. At the present time there are many problems calling for solution, especially because of the tendency to closer relations between the producers and consumers of goods, and the rapidly increasing prominence in the market of catalogue and supply houses and department stores. These are subjects which, while perhaps most immediately affecting the retail merchant, have also an important bearing on the business interests of both jobbers and manufacturers. At the coming meeting of the National Hardware Association, which will bring together representatives of many of the leading wholesale houses of the entire country, there is little doubt that these questions will receive attention, and the associations of retail merchants in different States will continue their efforts to remedy the existing evils, calling upon both manufacturers and jobbers with whom they have business relations to aid them in these endeavors.

Advices from Chicago.—The Shelf Hardware trade is running along at about the same rate as in previous weeks. Some localities are sending in very good orders for all kinds of goods, while trade with others appears to be absolutely dead. The weather is doubtless an important factor at this time of the year and the localities having colder weather are finding their trade stimulated. Jobbers are inclined to make some concessions on staple goods in order to reduce their stocks in anticipation of the slack times which may be expected until after the new year. They are at the same time anxious to see manufacturers advance prices on such lines of goods as are closely connected with Iron and Steel, believing that this would have good effect on all classes of trade. The deep cut in Western freight rates is expected to be of some benefit. Manufacturers of Tinware are enjoying a remarkable business when the quietness in other lines is considered. More orders are coming in for carload lots. The demand for better goods is also a striking feature. An instance of this is seen in the much heavier trade done in such articles as Wired Dish Pans and Enameled Ware. A very heavy business is still being done in Gold Pans for the Pacific Coast. Heavy Hardware seems to be getting better instead of worse. Collections in all branches of the Hardware trade are much better than they have been, showing a good condition financially throughout the country.

Advices from St. Louis.—The demand for Shelf Hardware continues to show a steady improvement. The lifting of the quarantine in the South has had a most beneficial effect on trade and orders from the South have been pouring in for a week past with no present signs of diminishing. The demand from this section comes at an opportune moment, as the West and Northwest had already supplied their wants and some complaints of dulness were beginning to be heard, and dullness generally paves the way for lower prices. The demand from the South is, therefore, doubly welcome, and prices which gave evidence of being shaky a week or ten days since have now recovered and are likely to be maintained during the balance of the year. The scarcity of Black Sheets continues and prices are being firmly maintained. Galvanized Iron is active. The recent advances made in Carriage and Machine Bolts and Lag Screws are being well maintained, and the gentlemen's agreement among the Bolt manufacturers is showing more stability than was anticipated. The general situation is now quite satisfactory, and unless something unforeseen occurs November and December should prove good months in the Hardware trade.

NOTES ON PRICES.

Wire Nails.—There continues to be a fair but not especially heavy movement of Nails, and notwithstanding rumors which are current of intended concerted action among the manufacturers there is little if any speculative buying. The tone of the market, in fact, is not especially strong. New York quotations for small lots from store are about $1.65.

Advices from Chicago.—New business is somewhat slow at present, but there would appear to be no special occasion for any weakness. The local market, however, has gone off somewhat, on account of the pressure to sell by jobbers. They have larger stocks or heavier contracts than they wish to carry through the remainder of the year, and are making inducements to retailers in order to move them. Jobbers' prices, therefore, are not in line with manufacturers' quotations. Jobbers sell small lots from stock at $1.50 in some cases, although $1.55 is more regular, and sales are reported up to $1.60.

Advices from St. Louis.—The market shows some signs of weakness, which, however, is largely confined to the jobbing trade, who bought liberally and are becoming impatient on account of the refusal of prices to advance, and rather than carry their stocks of Nails are shading prices somewhat to cut them down. Jobbers are generally asking $1.60 to $1.65, base, for small lots.

Cut Nails.—The market has been somewhat sluggish, with a moderate volume of business. There seems to be, however, a disposition to use Cut Nails for some purposes instead of Wire Nails, which for some time have taken their place, it being generally recognized that for certain uses the Cut Nails are superior. The market both East and West is at present an open one. New York prices for small lots from store are $1.40 to $1.45.

Advices from Chicago.—Small lots of Cut Nails are moving in a moderate way at $1.45.

Advices from St. Louis.—The market is quiet, and sales are unusually light. Jobbers are asking $1.55 for less than carload lots.

Barb Wire.—There is little change in the Barb Wire Market. The demand has perceptibly diminished and prices remain as before.

Advices from Chicago.—Prices are being held firmly by manufacturers and jobbers. Old orders keep the mills busy, and they will also soon have to stock up for spring shipments. Rods are scarce and dear and stocks are not pressing heavily on jobbers, as in the case of Wire Nails. Prices are therefore steady at $1.60 for Painted and $1.90 for Galvanized in small lots from stock.

Advices from St. Louis.—The movement in Barb Wire is limited and no improvement is looked for until after the turn of the year. Jobbers quote $1.60 to $1.65 for small lots of Painted and $1.90 to $1.95 for Galvanized.

Smooth Wire.—The demand for Smooth Wire is limited and prices are unchanged.

Freezers.—Manufacturers of Ice Cream Freezers are announcing their prices and beginning to book orders for next season. Their quotations are not materially different from those which prevailed last season, the general conditions not justifying an advance in prices, and the fact that the goods have been sold at narrow margins of profit making it unwise to lower prices. On account of the exceptionally cold and wet weather which prevailed last spring and summer the sale of Freezers was somewhat

curtailed. An abundant ice crop throughout the country and seasonable weather are referred to as likely to give an excellent trade in this line during the coming year.

Shot.—Under date November 1 Markle Lead Works, St. Louis, issue a circular in which they state that having caught up with their orders they are now quoting $1 base per 25-pound bag, f.o.b. St. Louis. They explain that this is not a card price, but a quotation with no further discount or allowance for cash or freight. Orders without specifications will not be accepted, and no order for less than 80 bags will be considered. With the considerable divergence of quotations now current in Shot, as made by the manufacturers East and West, the market is in an irregular and somewhat demoralized condition.

Glass.—It is probable that on or about November 15 Glass jobbers will receive official notification of the existence of the American Glass Company—the new single Glass agency—at which time it expects to begin operations. A new price-list of American Glass is expected to supersede the present one, which with new discounts will advance prices. While no definite statement has been made as to the advance, rumor has it that the new prices will be equivalent to about a 25 per cent. advance over present prices. Under the circumstances so radical an advance is certainly uncalled for, and would be likely to open up the way for an increased importation of foreign Glass. It is true that Glass is scarce, and that it is becoming more so every day that the resumption of the factories is delayed. The scarcity of Glass has had the effect of giving a firmer tone to the New York market, and has resulted in an announcement of a further advance in jobbers' discounts on small lots to 60 and 5 per cent. New York quotations on imported Glass continue 80 and 20 per cent. discount. Chicago jobbers' price for American Glass is 60 and 10 per cent. discount, except for 16 x 20 single strength, this size being 60 per cent. discount. It is anticipated that a further advance of 5 and perhaps 10 per cent. will take place.

White Lead.—There have been no really new developments in the market. Jobbers have, to all accounts, put out as much stock as they usually do at this season of the year, and corroders report a good average movement, particularly of the smaller size packages of Lead in Oil for delivery in the immediate vicinity. Prices have ruled very steady throughout.

Red Lead.—Nothing more than ordinary business has taken place in this article, and prices have ruled very steady.

Linseed Oil.—Prices have ruled very firm for domestic seed Raw Oil, in sympathy with the high cost of raw material. Business has been only fair, however, and the demand is commonplace.

Spirits Turpentine.—There has been rather freer movement of fair sized lots and prices are steadier.

Miscellaneous.—Whiting, Chalk and Clays generally remain steady in price, but are meeting with merely ordinary sale.

TRADE NOTES.

A charter has been granted to the Metal Storage Company of Pittsburgh, Pa., with $2500 capital. The directors are C. I. Travelli, Stewart Johnson, G. W. Irwin, David McCargo and Edward D. Riddle, all of Pittsburgh.

Haight & Clark, Iron and Brass founders, Albany, N. Y., are now making a specialty of Castings in Aluminum and Aluminum Bronze.

The Struthers Iron & Steel Company, Struthers, Ohio, manufacturers of Iron and Steel Sheets and Galvanized Sheets, are running their plant to its full capacity, and are crowded with orders. The new galvanizing department put into operation by this concern some time since is running very satisfactorily.

The crisis in the Manchester cotton industry, which was threatened through the Operatives' Union instructing their delegates not to consent to a reduction in wages called for by the manufacturers, is believed to have been averted, an offer of arbitration having been accepted by both sides. The threatened strike, which would have involved about 160,000 cotton operatives in the British center of that trade, would, if carried out, have given a most serious blow to this important industry.

The November letter of the Anthracite Coal Operators' Association characterizes the anthracite market as extremely unsatisfactory both as regards demand and prices. While a large tonnage was mined during October a considerable portion of it was stocked to await a market, and sales for actual consumption have not been nearly as large as were expected, dealers purchasing only according to immediate requirements. Any improvement which may be expected must come from a prolonged spell of cold weather, which would force buying for consumption. Prices of anthracite are stationary, with the tendency downward, the average sales at the present time being at a little below June figures. Whether or not there will be an improvement before January 1 will depend upon the tonnage put out and purchased in November and December. But it will need the most radical reduction in shipments to effect it.

Late European exchanges gave some account of the large steel works, which are now in course of erection near the town of Saratov on the Volga in Southeastern Russia. These are being built by a concern known as the Volga Steel Works Company. The works cover 92 acres of ground adjacent to the river, and are so arranged that the raw material will be delivered by rail at the highest part and gradually descend in the process of manufacture until the finished products are stored at the warehouses on the river side. A wire making plant will be among the departments provided for. A large model village is being built for the workmen, each family being assigned a separate dwelling

—"LAST SUMMER," says a telephone manager of Chicago, "a big, portly, smiling, but excited man rushed in and asked if he could reach Evansville, Ind., by 'phone. He was assured that he could and in about two minutes he disappeared in a booth to talk to his wife. Well, he talked about fifteen minutes. Finally he bounced out of the box, slapping his thigh. 'They're on me, gentlemen,' he said. 'I'll be right back.' He darted out, and in two minutes was back with a box of as good cigars as I ever smoked. 'It's a boy!' he exclaimed, 'and he's got about as good lungs as I ever heard at close range!' Then he told the story. He had to be absent from home, and a telegram had just come notifying him of the new arrival. He had rushed into the office, called up his residence and insisted that the nurse bring the baby to the telephone and make it laugh or cry. It cried, and he heard it three hundred miles away."—*N. Y. Tribune.*

—SINCERE LOVE.—"Did he marry for love, Storker?"

"Yes; for that love which is said to be the root of all evil."—*Detroit Free Press.*

—AVOIDABLE ACCIDENTS.—Bicyclers point out that if all horses had to carry lamps over their left ears many distressing casualties could be avoided.—*Chicago News.*

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

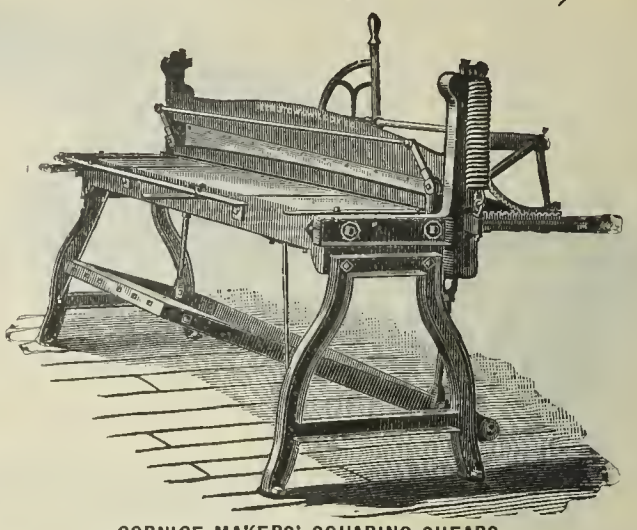
Hundreds sold and **never a complaint.** Works easily and rapidly. The universal verdict is, **IT IS THE BEST IN THE WORLD.**

96 inches long. Price $250.

Our **Improved Eureka Cornice Brake.** Will bend No. 20 iron.

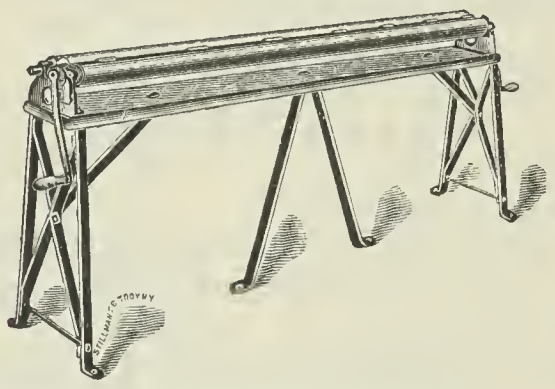
96 inches long. Price $185.



CORNICE MAKERS' SQUARING SHEARS,

With Lever Arc, Automatic Gauge. Will cut No. 22 iron. **97 inches long. Price $275.**

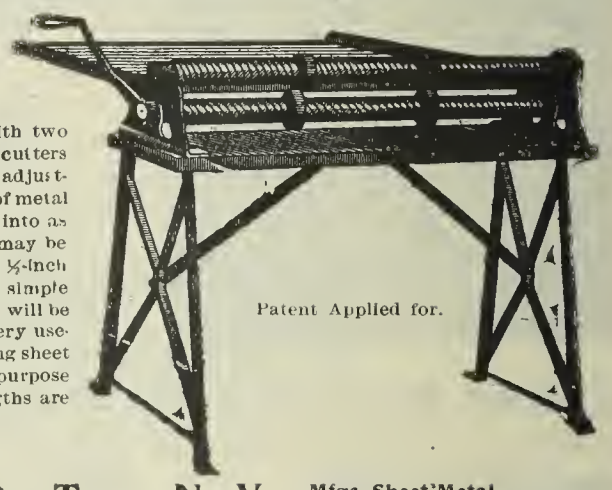
The CAPITAL GUTTER FORMER



is adapted to form gutter from 3 inches to 7 inches inclusive. The forming of the head and gutter is practically a continuous operation. Capacity 600 feet perfectly formed gutter per hour with two ordinary men or boys.

The Rotary Slitting Shears

are provided with two or more pair of cutters which are easily adjusted to cut a sheet of metal 30 inches wide into as many strips as may be desired, from ½-inch and wider; is simple and durable, and will be found to be a very useful tool for slitting sheet metal for any purpose where long lengths are required.



Patent Applied for.

Mention THE METAL WORKER.

For further information and prices address **WATROUS & CO., Troy, N. Y.,** **Mfgs. Sheet Metal Working Machinery.**

—It is a matter of popular knowledge now that all fermentation is caused by some microscopic organism, and special cultures of particular bacilli are sold to dairymen for the purpose of inoculating their cream to give the butter a specially fine flavor or good keeping quality. In the same way specific bacteria which help various plants to get their nitrogen from the air have been cultivated, and will probably soon become articles of commerce, so that the farmer can buy the particular kind needed when he wishes to vaccinate his fields for clover or peas or alfalfa. And now it is reported in *Garden and Forest* on the authority of the British Consul at Naples, that a special ferment is largely used there in the manufacture of port wine from barley. The grain is malted, after which the specific bacilli which caused the fermentation in port wine are introduced into the mead, where they multiply abundantly and transform the immature beer into the richest port. After their work is finished a sufficient stock of the microbes is preserved in the laboratory for future use, and the product is then sterilized. The manufacture of a good quality of port wine from barley mead is certainly a new triumph of science.—*New York Tribune.*

—"Yes," said the proud father, "he writes me that he has settled down to burning the midnight oil quite regularly, but as I happen to know that he has a room lighted by gas to pursue his studies in, I am afraid he refers to his bicycle lamp.—*Cincinnati Enquirer.*

BRIDGEPORT, CONN

—THERE is a sawmill in Grandin, Mo., many departments of which are in charge of women. There is a woman in charge of the engine. One of the rooms where the big saws are operated is managed by women. The lathe room is also popniated with feminlnity, and the machines of all sorts are handled by them. In the rooms adjoining a force of young women is constantly employed, filing and getting the saws in shape for work. The care of the machinery is in their hands, and it is said they are quite as adept and as competent to handle it as any force yet employed in the mill.—*N. Y. Tribune.*

—HE—"Could this little hand be a counterfeit?" She (gazing absently at a church steeple)—"Well, you might ring it and see!"—*N. Y. World.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

EXCELSIOR STRAIGHT-WAY BACK PRESSURE VALVE

This valve has no dash pots, springs, guides or complicated levers to get out of order. It is simple, reliable and well made. Never sticks, and can be relied upon at all times when using exhaust steam for heating; or when used as a relief, or free exhaust on a condensing plant, it has no equal. It is noiseless and free from any complicated attachments.

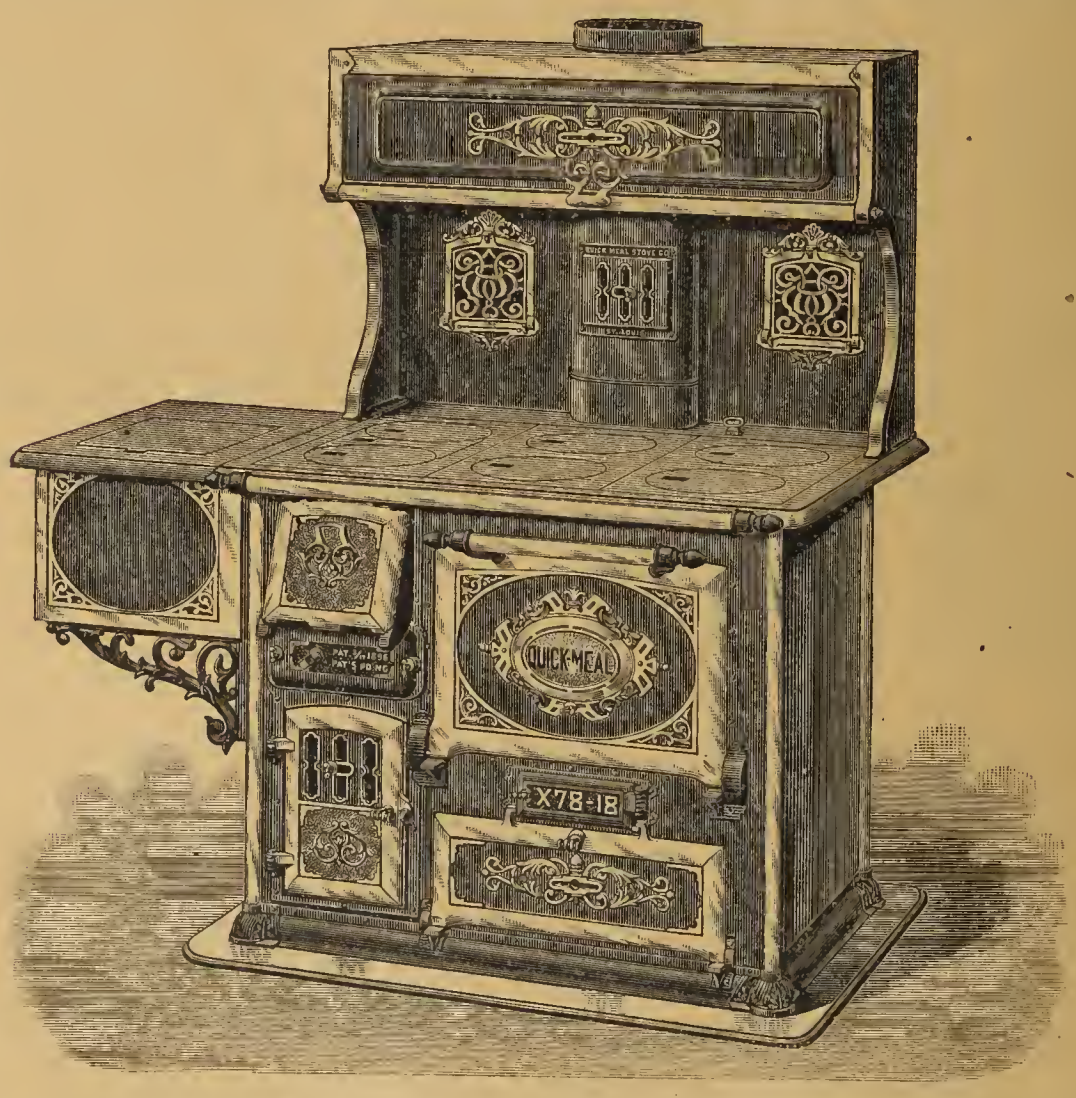
QUICK MEAL

STEEL RANGE.

The name tells the story of its convenience.



Quick Meal Steel Ranges are built to look well, to cook well, to bake well, to last well and to sell well. They are built to pay the Dealer a good profit and to give his customer the very best satisfaction.

They are the Best—Best in Material—Best in Workmanship—Best in Appearance.

That's what has made them popular and has brought them to the front. That's what has made them leaders in every section of the land, and that's why it is the most satisfactory and the most profitable Range for the Dealer to handle.

"That's What They Are."

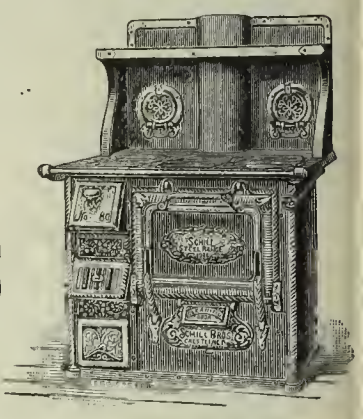
SCHILL

Furnaces AND Steel Ranges



Are Victorious Everywhere.

We do not crow of the results of the recent election, we have reasons of a more beneficial nature to do so. The demand for Schill Furnaces and Ranges has grown to such proportions that notwithstanding the several additions to our plant the past two years we are compelled to again enlarge our facilities in order to supply the demand for them, from the Atlantic to the Pacific Ocean, and from the Lakes to the South, nearly every mail bringing in additional orders, and the crowning feature is the award of a

GOLD MEDAL

at the Nashville, Tenn., Centennial Exposition over all competitors, a recognition of the merits of our productions for which we feel justly proud.

If you want to be in touch with your customers handle the Schill Ranges and Furnaces, they are best. Write

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR:

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal

Very truly,
I. N. EVANS.

STEAM AND HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.

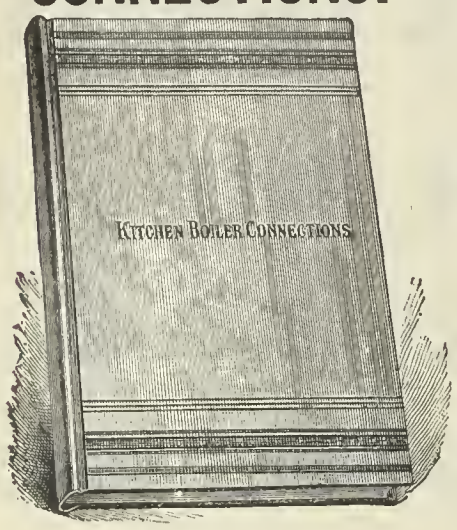
KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

MAGEE

"Mystic" Hot Water Heater.

Made in Five Sizes,
Nos. 11, 13, 15, 17 and 19.

Number of Heater denotes diameter of pot in inches.

Hot water capacity from 150 to 650 square feet of radiating surface.

DESCRIPTION.

The water heating chamber is arranged to surround the combustion-chamber and fire-pot, and in which the water-chamber is extended from the back of the combustion-chamber BELOW the Smoke-Outlet UPWARDLY and INWARDLY to NEAR the top of the combustion-chamber, largely increasing the water heating capacity of the heater, compelling the products of combustion to travel the entire inner side of the heater at the front to the top, and then downward upon the opposite side of the partition, and the opposite side of the combustion chamber, to the **SMOKE OUTLET.**

All Flue Surfaces adjacent to water.

Practically self-cleaning.

Permit us to explain this heater to you more fully. Send for Circulars. We are SURE of a satisfactory result, sure of your complete conversion to our methods.

REMEMBER the name "MAGEE," and that we have a full and complete line of Ranges, Furnaces, Combination, Hot Water and Steam Heaters, fully warranted. CORRESPONDENCE SOLICITED.

The Waste-Heat Radiator Attached to a Stove.

THE WASTE-HEAT RADIATOR

saves the heat that is usually wasted up the chimney; takes the cold air off the floor and heats it; takes the hot air from the ceiling and puts it on the floor; **saves a fourth to half the coal.** As the cold air is drawn in and up from the floor the hot air on the ceiling comes down to take its place, securing a continuous circulation.

TO STOVE AND FURNACE DEALERS:

DEAR SIRS:—The Waste-Heat Radiators have been in use in Minnesota and other parts of the Northwest, where the thermometer often registers thirty to forty degrees below zero, for the past three years and have been thoroughly tested, so they are no experiment; but until within the past few months, they have been made only in a limited way, as each one had to be made to order, owing to the difference in the height of the collars on different stoves and furnaces, but now we can make them with sliding collars and that they can be adjusted to fit any stove or furnace, therefore can make them in large quantities and do a general business in them.

The following people have used them during the past two or more years, to any of whom we refer: W. W. Rand, Sec'y Minneapolis Gas Light Co., Minneapolis, Minn.; J. C. Oswald & Co., Minneapolis, Minn.; Wm. Cunningham, St. Paul, Minn.; R. A. Lanpher & Co., St. Paul, Minn.; M. M. Gasser Co. Duluth, Minn.; W. W. Schiffman, Duluth, Minn.

The letter printed herewith from Mr. Clifford Hubbell, Cashier of the Columbia National Bank, Buffalo, N. Y., speaks for itself.

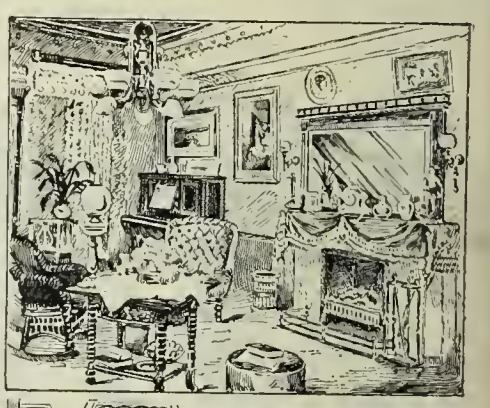
COLUMBIA NATIONAL BANK OF BUFFALO.
JOSIAH JEWETT, President.
CLIFFORD HUBBELL, Cashier.

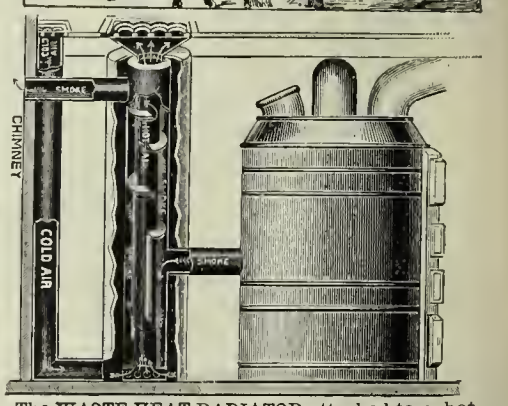
BUFFALO, N. Y.

DEAR SIRS:—Regarding the Waste-Heat Radiator which you placed in my residence, No. 71 Highland Ave., I have to say that it has worked admirably. I believe that the furnace burns 25% less coal now than formerly, and I think that that percentage is a very low estimate. In my mind the greatest advantage is that it draws the cold air from that part of the house where the cold air most accumulates, and makes the temperature in the rooms much more even, conducing thereby to comfort and healthfulness. I know that my wife, being skeptical about patent inventions of any kind, before this was put in, has come to acknowledge that this accomplishes the purposes for which it was purchased; viz., to save a large portion of the waste heat that goes up the chimney, and to save in the amount of coal burned, and make the temperature more even.

Yours respectfully,
CLIFFORD HUBBELL, Cashier.

In order to introduce our Radiators we will send one to any reliable Stove or Furnace Dealer and if he finds it as we represent it then we want him to buy it and take the exclusive sale of them in his city; otherwise to hold it subject to our order. Yours truly,





The WASTE-HEAT RADIATOR attached to a hot-air furnace; attaches to steam and hot-water boilers in the same way.

—POINTER ON SQUEEZING.—A little black-eyed and nimble-tongued Irish street car conductor on a branch of Boston's West End Railroad is a source of no end of amusement to the passengers along his route by reason of some of his startling utterances.

One day he came into the car and called out in his peculiarly penetrating voice: "Wan seat on the roight! Sit closer on the roight, ladies and gintlemen, an' mek room for the leddy phwat's standing."

A big surly-looking man who was occupying space enough for two, said, sullenly:

"We can't sit any closer."

"Can't yeez?" retorted the little conductor. "Begorry, you niver wint coortin', thin."

"It is needless to say that room was made "on the roight" for the lady.—*Harper's Bazar.*

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

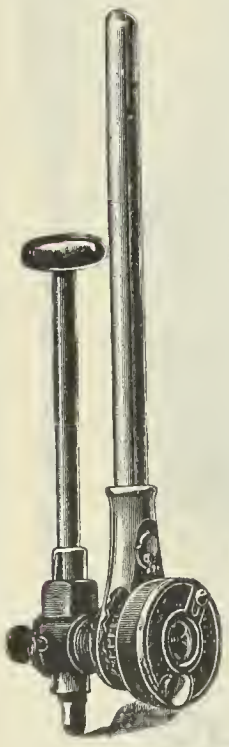
The Climax Ratchet Stock.



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and hy means of the leading thread the die is forced on pipe aud the thread is cut. It is made of malleahle iron and steel,and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies,which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½,3 and 4 in. die,$17.00

Munnysacks—Yes, James; very low in the neck.—*Exchange.*

—She was reading in a low, thrilling voice: "When the packing begins in earnest, it seems as though there could be no spot on the earth's surface unshaken." He roused himself from a somnolent attitude in an easy chair. "Who wrote that, Marla? He's been through it, whoever he is. I wonder who he married." "Why, you great stupid," said she, "It's Nansen writing about the ice."—*Household Words.*

AVOID MISTAKES AND LOSS
BY USING THE
CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1 00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Sent, prepaid, on receipt of price by

HANDLED BY ALL LEADING JOBBERS

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*

"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bantler de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographa which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given, 75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex.

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

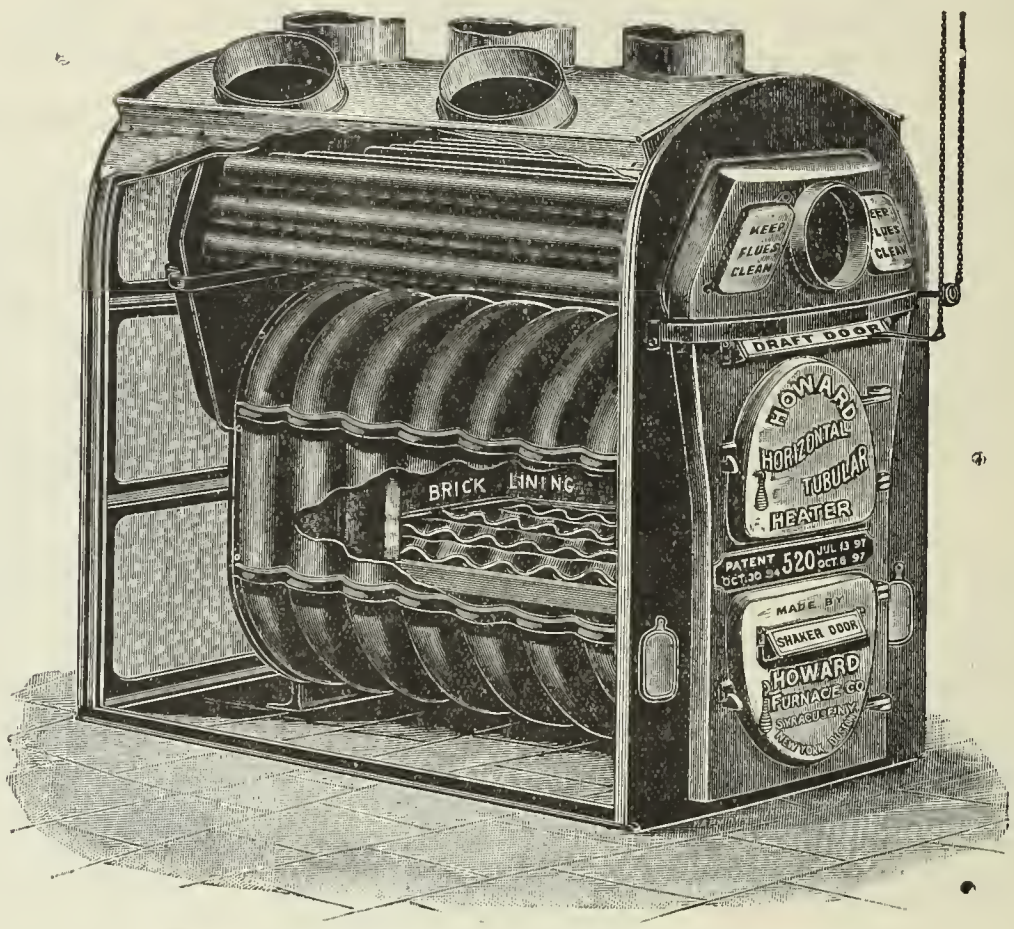
a hot draft

When speaking of a hot draft, we do not mean a hot chimney. We refer to the fundamental principles of properly burning fuel. In order to produce and maintain a good fire an adequate supply of air must be furnished and carried to the fire in a pure state. Then there must be produced an intimate mixture between the inflammable gases before they pass beyond a point where the temperature is insufficient to induce chemical action between the combustible and the supporter of combustion. To do this the air which feeds the fire must be heated. It must be heated to a high temperature.



Patented: Oct. 30, 1894. July 13, 1897. Oct. 5, 1897.

the brick lining

as shown in the cut forms an air space with the sides of the fire box. It is in this air chamber that a hot draft is produced. The air is taken from the ash pit to the fire by passing through this air chamber. The draft is therefore more effectually heated and becomes more rarefied than can be done in any other way. It is heated in the hottest place in the furnace. This hot draft produces another gas (carbon dioxide) that raises the temperature of furnace plate with less fuel.

The Business Situation.

At this advanced season of the year it is not natural to look for any very large movement of business. Nevertheless, the current volume of trade, as evidenced by the returns of bank clearings, is seen to be exceptionally heavy. Last week's total clearings were larger than in any preceding week since September 2, amounting to over $1,347,000,000, an increase of 10 per cent. over the preceding week and of 13 per cent. over the second week of November, 1896. This is accounted for largely by the colder weather, which has materially stimulated trade in winter goods, particularly in the West, and by the raising of quarantines against yellow fever in the Southern districts, where traffic is resuming its normal volume. Large orders for goods are being sent out from that section in consequence. These two factors have brought about a healthy movement of merchandise for early delivery, which is keeping manufacturers and merchants busy in many quarters. Otherwise the general business situation shows little change from that outlined a week ago. Local trade in the Eastern and Central States is confined mainly to the filling of current needs, and in some lines is referred to as sluggish. Prices in the main are unchanged. While advances have been few and scarcely worthy of note, recessions, on the other hand, were equally unimportant. Meanwhile, although nothing indicates more than a moderate business during the remaining weeks of 1897, the outlook for trade in 1898 is generally regarded as promising, and manufacturers are preparing for an active spring campaign. Mills and factories at the present time are kept busy filling belated and delayed orders for the winter, and expect to run along on these until orders for spring goods come in. Railway earnings show increasing expansion, amounting for the current month to over 20 per cent. above the figures for this time last year. Last October's aggregated earnings of 132 roads exceeded those of October, 1896, by nearly 9 per cent. The speculative markets have been dull with a narrow volume of dealings and no radical changes in values. Money rates are easier. Loans are offered liberally on attractive terms, but the supply far exceeds the demand. With the reserves of the banks swelling week by week, there is every prospect of continued ease in the money market.

The Paris Exposition of 1900.

Major Moses P. Handy of Chicago, who was appointed by the President as special commissioner to the Paris Exposition of 1900, returned home last week from a sojourn in the French capital with the very satisfactory news that he had been able to secure 200,000 square feet of space for the display of American exhibits. In the Paris Exposition of 1889 this country had only 113,000 square feet, yet made one of the best national displays. Major Handy was somewhat handicapped at first in his efforts to secure adequate space from the fact that the United States was behind all the other great nations in accepting the French Government's invitation to participate, and her representative was in the field nearly a year after the other foreign commissioners. Nevertheless, Major Handy succeeded beyond his expectations in obtaining as large an allotment as was given to any country. From the number and character of the applications for space already filed by American exhibitors, he asserts that no country will be better represented at the Exposition. The only difficulty will be in satisfying the demands of all the would-be exhibitors. The commissioner makes the prediction that the Exposition of 1900 will eclipse anything of the kind in the past, and regards it as an unsurpassed opportunity for the extension of American trade abroad. An office for receiving and filing applications for space and for distributing information regarding the Exposition has been opened at the Bowling Green Building, 11 Broadway, New York, under the charge of Col. L. M. Hamburger, assistant to the special commissioner.

Industrial and Trade Schools in Belgium.

United States Consul Morris, at Ghent, Belgium, reports to the State Department as follows: "Recent official statistics show a considerable increase in the number of industrial and trade schools existing in Belgium. There are 82 in all and 32 apprentice shops. Each of these schools afford the instruction appropriate to its locality—thus, for example, at Charleroi, metallurgy; at Moranwelz, mining; at Soignies, stone cutting; at Ostend, fishing; at Antwerp, maritime construction; at Ghent, weaving; and at Bressage, straw platting is taught. Housekeeping schools and classes number 219. Altogether there are 333 professional, industrial, or trade institutions of instruction in Belgium. The subsidies accorded them by the Government during 1896 amounted to $150,000, while they counted about 7000 pupils."

A new alloy, named Margot's metal, is described as of a purple color, with ruby red reflections. It is a compound of 22 per cent. of gold with 78 per cent of aluminum. It is very beautiful, but is deficient in malleability. Margot, its discoverer, is of opinion that its color is due to microscopic crystals of alumina disseminated in the mass; but this is open to doubt. The yellow alloy of platinum and aluminum can, by a modification of the proportions, be rendered violet or greenish. A rose colored alloy is obtained with 75 parts gold, 200 parts silver and 50 parts copper.

The Philadelphia City Councils have passed an ordinance requiring every engineer and fireman employed in the city to be licensed as a skilled mechanic and to pass an examination before the Municipal Bureau of Boiler Inspection. The ordinance was introduced at the request of the American Order of Steam Engineers, and is designed as a safeguard against incompetent men in charge of boilers.

THE LETTER BOX.

An Overflowing Expansion Tank.

From G. V. H., Lambertville, N. J.—We have a hot water heating plant here that has given the owner considerable trouble from overflowing. Will you kindly tell us through *The Metal Worker* what to do to remedy the trouble? The conditions are as follows: The hot water heater, having a capacity of 700 square feet of radiation, is connected with a system in which there is but 397 square feet of radiation in seven radiators. The expansion tank is placed so that the bottom is only about 6 inches above the highest radiator. It holds about 8 or 10 gallons and has an overflow pipe 4 inches from the top of the tank. It is covered with an ordinary rim lid without any extra vent, depending for vent on the looseness of the fit of the rim of the lid. Once last winter the tank overflowed about 60 gallons. The cover was on the tank at the time and the water ceased to overflow the minute the cover was removed. Under ordinary circumstances I should say it was a case of overheating or boiling over, but there are conflicting ideas as to the condition of the fire at the time the overflow took place. One occupant of the building says the fire was extremely hot at the time, while another says that there was very little fire going. In either case, will you kindly help us out of the trouble by telling us the cause and how to remedy it?

Note.—We shall be glad to have those who have had similar experiences give an account of the trouble and how it was removed, with a view of helping this correspondent. In the meantime we would say that there can be little doubt but that the fire was the cause of the trouble by creating an expansion of the water, and in view of the large heating capacity of the boiler, compared with the surface it has to carry, it is more than likely that steam has been generated and caused the continued overflow reported. Without a sketch of the piping system it is impossible to tell whether or not there are some defects in this that might contribute to the trouble. This part of the system should be carefully gone over, to see that a proper pitch is preserved in the piping throughout and that there are no air traps. In some instances, where a boiler has a greater capacity than is needed, the fire chamber is reduced in size by lining it with fire brick. This reduces the heating power of the fire and also prevents the heat of the fire coming in direct contact with the water heating surfaces. In view of the heating power of the boiler in proportion to the radiation, what might seem a very small fire would be sufficient to generate steam and cause the overflow. The remedy is to so arrange the piping that a connection will be made with the expansion tank above the water line. This pipe should be run so that the system would be relieved through it of any steam generated in the boiler. Occurrences of this kind are not uncommon and are readily overcome by relieving the boiler of steam as soon as it is generated, and thereby preventing the steam from forcing the water out of the system through the pipe to the expansion tank.

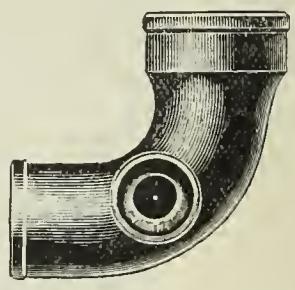
Machinery and the Labor Question.

From L. M., New York.—Please publish in *The Metal Worker* your opinion regarding the statement, "Resolved, That inventions in machinery are desirable." If you can give any reason why they are not desirable they will be greatly appreciated.

Note.—Our correspondent has asked a very wide reaching question and we should hesitate to enter into a discussion of the effect of machinery on modern industrial life. It is not, strictly speaking, an unending argument, but it is one that can be so long drawn out that *The Metal Worker* would have to devote all its pages to a presentation of the two sides of the question. We think our correspondent's wishes will be better met by referring him to an article in the *North American Review* for October, 1897, entitled "Man and the Machine," and written by Bishop Henry C. Potter. The article will furnish what our correspondent wishes—some of the arguments against machinery— and, furthermore, it contains many references to other articles and books on the subject which our correspondent may consult if he wishes to instruct himself on this subject.

Right or Left Fittings.

From M. A. W., Hudson, N. Y.—Will you kindly advise me if there is any rule for determining whether soil pipe fittings, such as elbows, sanitary T-Y's and Y's, having



Right or Left Fittings.—Fig 1.—*A Left Hand Quarter Bend.*

a side connection are right or left hand? This knowledge will enable me to avoid all errors in ordering goods.

Answer.—In order that our answer may be readily understood we have reproduced from the catalogue of Peck Bros. & Co., in Fig. 1, a quarter bend with a side connection; in Fig. 2 a T-Y with a side connection and in Fig. 3 a Y, with a side connection. On interviewing a number of the plumbing supply houses as to their custom of determining

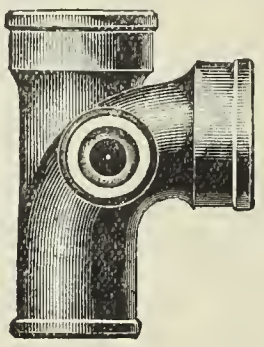


Fig. 2.—*A Right Hand* T-Y.

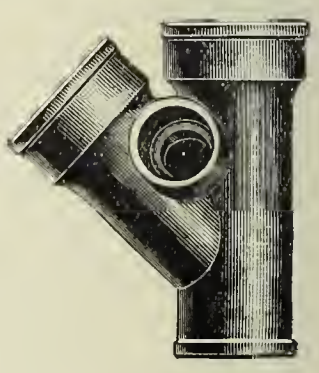

Fig. 3.—*A Left Hand* Y.

whether such fittings are right or left hand, we find that it is the custom to look into the hub end of the fitting and in the direction which the water flows through the main pipe, with the main branch into the fitting held on the side away from the person who is holding it. Then if the side connection is on the left hand side it is a left hand fitting and if on the right hand side it is a right hand fitting. The quarter bend shown in Fig. 1 is a left hand fitting, the fitting shown in Fig. 2 is a right hand fitting, while the fitting shown in Fig. 3 is a left hand fitting.

Plumbing Regulations.

From H. K., Philadelphia, Pa.—Can *The Metal Worker* inform me whether there is a book published giving the regulations and laws for plumbers, and if there is a difference between the laws of different States.

Answer.—We know of no book published giving the laws of the different States. The last report of the National Association of Master Plumbers includes the laws of several different States, and all of these laws differ in some respect. Our correspondent can probably secure the laws of any particular State he desires by addressing the Secretary of State, and by addressing the Board of Health or City Clerk of any city it is quite probable he can secure a copy of the ordinances which have been passed to regulate the examination of plumbers and the supervision of plumbing work.

Heating a Closed Room.

From M. W., Little Falls, N. J.—Will you or some of your readers tell me how to heat a room 12 feet long, 7 feet wide and 12 feet high to about 280 degrees with steam? The room has no windows and is as nearly air tight as it can possibly be made, being lined with asbestos paper. There is floor room for two 1-inch ten-pipe coils, the extra space being taken up with trucks upon which a substance like dough is to be dried. This dough is to be dried quickly, and when the work is properly done it will be crisp and break like glass. The boiler is about 60 feet from these coils and carries about 45 pounds of steam. I have four coils in the room now, each containing about 140 running feet of 1-inch pipe, the coils being supplied from the boiler with 1¼-inch pipe, and returns are 1-inch pipe. The coils will heat the room to 180 degrees, but will not do the work required of them. The boiler is only tapped for 1¼-inch and that is the reason that size main is used in the coil. The inside coils may be made of larger pipe, but I prefer to leave the coils now in and put other ones above them if necessary and over the ones on the floor. If you can change the plan any so it will supply the necessary 280 degrees of heat with the same amount of pipe or by adding more pipe to it, or suggest any other way of getting out of the trouble, I will be very thankful to you.

Answer.—The trouble of our correspondent lies almost entirely with the boiler pressure. Experience with japanning and vulcanizing ovens has shown that it is impossible to obtain 280 degrees temperature in a working oven with 45 pounds boiler pressure. The temperature of the steam in the boiler at 45 pounds is 292 degrees F.—only 12 degrees above the required temperature in the oven. The room as described contains 504 cubic feet of space, with coils equal to 560 feet of 1-inch pipe, or 187 square feet of heating surface. This is equal to 1 square foot of heating surface to 2.7 cubic feet of space, which, with the boiler 60 feet away and no statement as to the amount and quality of felting on the steam pipe, shows as efficient heating power in the dry room as may be expected under the present arrangement.

We can only advise increasing the amount of pipe in the oven as much as can be conveniently accommodated—say 200 to 300 feet of 1-inch pipe—put in a larger steam pipe, say 1½-inch, and felt all the steam pipe and connections from the boiler to the room with thick magnesia felting. Then raise the pressure in the boiler as high as safety will permit, say to 75 pounds or more.

Boilers for the temperature and purpose that you require usually carry from 100 to 110 pounds pressure. In order to properly dry a moist or wet material that is in masses that allows of the surface becoming dry and thus retarding the escape of moisture from the interior, the most approved management has been to close the room tightly at first and until such time that the whole mass has reached the temperature of boiling water, when the room becomes saturated with vapor and the surface of the material is moist and allows a free passage of the vapor from within. Then ventilate slowly to get rid of the vapor, and when the vapor ceases to escape at the ventilator a closure will raise the heat to the highest temperature required for perfect dryness.

Starting a Tin and Cornice Shop.

From J. K., Indiana.—I would like to learn through *The Metal Worker* what tools a man must or ought to have to start a tin and galvanized iron cornice shop.

Answer.—The tools required for a sheet metal cornice shop would be as follows: Cornice brake, 7 or 8 feet long; small brake, 3 feet long; brace bender, brace cutter and puncher, square head, hatchet stake, mandrel stake, blow horn stake, squaring shears, 30 inch or 36 inch; pipe roller, 36 inch length; vise, round headed stake, small turning machine, raising and stretching hammers of various sizes, block for raising, made of lead 12 x 12 x 3 inches; various sizes of hollow punches, and if large work was undertaken in circular work a curved molding machine, and beading machine for beading eave troughs. The tools required for a tin shop doing tin roofing, &c., would be a tin notcher, edger for flat seam roofing, edger for standing seam roofing, hand seamers, and for tin shop work a groover, crimper and swedging machines, hand groovers, soldering coppers, file, mallet, prick punches, rivet punches, rivet sets, scratchawls, compass, plyers, scraper, chisel, hammers, right and left and circular shears and stock shears.

For laying out details for cornice work there would be required one drawing board, about 4 x 6 feet; one small board, 2 x 3 feet, T squares to match; triangles of 33, 45 and 60 degrees, No. 4 pencils and set of drawing instruments. Other tools may be required according to the nature of the work in hand, but these can be obtained when wanted.

Water Leaves the Gauge Glass.

From A. T. E., Ottawa, Kan.—There is a steam job here of the two-pipe type, in which when the steam gauge shows a pound or more of steam the water disappears from the glass gauge. The check valve in the return is in good order. Any suggestions as to the cause and remedy would be appreciated.

Note.—We shall be glad to have our readers give their views on this subject. Without a sketch of the piping it is difficult to locate the trouble and we can only deal with it in a general way. If the steam main is smaller than should be used with the radiation connected to it there is a probability that condensation in the radiators will take place quickly and have a tendency to disturb the water line in the boiler. Another cause of this disturbance would be the failure of the air valves on the radiators to operate, so that when steam in the radiators condensed they would not allow air to come into the radiators to fill the space, consequently the tendency to vacuum would be sufficient to affect the water line. The connections between the glass and the boiler should be examined to see that they are perfectly clear and it is better to have them ¾ or 1 inch in size.

Patterns for Cold Air Box.

From F. V.—I wish you would explain through *The Metal Worker* how to lay out the elbows shown in the sketch, the work being for a furnace cold air box.

Note.—The sketches of plan and elevation sent us by our correspondent show a cold air box of rectangular section, rising vertically from the cellar floor near the furnace, then running upward and diagonally to the cellar ceiling, then turning again and running horizontal and parallel with the connection in the cellar floor. This is quite an elaborate problem, and if our correspondent will refer to *The Metal Worker* of July 14, 1894, he will find the solution of a very similar problem, the only difference being that the pipe first runs horizontally from the furnace. By consulting problem 99 in "The New Metal Worker Pattern Book" he will also find the solution reprinted from *The Metal Worker*, together with another solution of the same problem, while problem 100 treats still another, under similar conditions, by a third solution.

HEATING AND PLUMBING.

New Jersey Master Plumbers' Convention.

The first semi-annual convention of the New Jersey State Association of Master Plumbers was held in Helvetia Hall, Paterson, N. J., on Wednesday, November 17, and was opened by the president, John Hickman. After appointing Ira Budd sergeant-at-arms and S. A. Walker, M. Moran and P. J. Brady a Committee on Credentials, the chairman made an address of welcome. He called special attention tc the importance of the plumbers throughout the State using their influence to secure the passage of a State plumbing law. Among those present were:

G. M. Sinclair, E. Tietje, C. Bach, A. Pflugh and Geo. Vinton from Hoboken.

E. E. Moore, J. J. Kielt, T. F. Kelleher, Thomas F. Heatherton, J. S. Donnelly, M. Moran and John Anderson from Jersey City.

Wm. Devlin, P. J. Brady, J. J. Devaney and P. Flanagan from Bayonne.

National State Vice-President Winslow Zeliff, Elias Berla, C. Sullivan, E. A. Bleything, Ira Budd, Wm. Jacobi, R. Berla, N. J. Steiner, F. J. Sturn, C. E Harrison, C. P. Zimmerman, J. Sutcliffe, Wm. Mooney, W. Hulley, H. Knott, J. Gries, E. E. Joice, S. A. Walker, F. Hasselmeyer, E. Becker, Wm. Virtue, J. P. Zitner, R. Kreitler, R. Groeman and J. S. McDonald from Newark.

John Hickman, John Campbell, A. J. Fielding, John Baker, James McNabb, James Kearney, B. J. Rogiers, R. Beaumont, Levi McBride and J. Quinn from Paterson.

Plumbing Inspector W. H. MacDonald and Secretary of the Board of Health J. P. McNair of Paterson were also present.

The secretary's report showed an increase in membership and a balance in the treasury. A motion was then passed for a retaliatory action to be taken by the plumbers against hardware dealers who sell plumbing goods at cost, the plumbers to retaliate by selling hardware goods at cost.

The following resolutions were then adopted:

Resolved, That the trade schools of the United States do not enroll students at the plumbing trade unless they have served at least one year at the trade.

Resolved, That the term of apprenticeship in this State shall be six years and that the State officials use their influence with the National Association of Master Plumbers to have this term adopted for the United States.

A telegram was received from Thomas P. Culloton, president of the National Association of Master Plumbers, requesting the president to impress upon the members the importance of dealing strictly in accordance with the "Baltimore Resolutions."

The president appointed the following Legislative Committee, the first three of which are newly elected members to the New Jersey Legislature:

Thomas F. Kelleher, chairman.

Jacob Rau, Jr.; C. B. Bauman, Ira Budd, S. A. Walker, E. E. Moore and P. J. Brady.

Mr. Kelleher requested the delegates to present their views as to what should be provided in the hoped for law and a general discussion ensued. A motion was passed that the law should require that the Examining Board consist of a master plumber, a journeyman plumber and a member of the Board of Health.

A feature of the convention was the absence of the executive session which has excited so much suspicion in reference to plumbers' gatherings.

The annual meeting will be held in Jersey City May next on a date to be announced by the Executive Committee. The convention then adjourned.

THE SMOKER.

The Master Plumbers' Association of Paterson, N. J., invited their guests to visit their headquarters in the Romaine Building at the close of the convention, and while entertaining them spread a fine collation at Helvetia Hall, to which they were invited to return. An orchestra furnished a musical programme, varied by singers who rendered the songs of the day. At this entertainment the friends of the plumbing trade were cordially received.

Clifford Schlemmer had a word to say for the New York headquarters of the Temple vent fittings at 109 Beekman street.

J. O. Wilson said he was the only man who had all kinds of bathtubs to sell that were made at the plant of his house, and invited inspection at 92 Walker street, New York.

C. S. Graves, from 94 Centre street, New York, said he had American boilers that were an Advance and of a Perfect type, capable of making Florida weather at any season.

Frank Austin represented the A. A. Griffing Iron Company.

J. Watson, Jr., McNabb & Harlin Mfg. Company.

B. S. Kelly, F. N. Dubois.

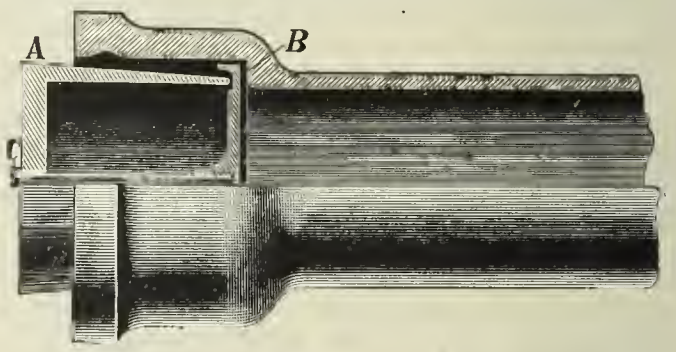
M. T. Gorman, Henry Huber Company.

I. G. James, Gurney Heater Mfg. Company.

A. Devoe, Thatcher Furnace Company.

Streeter's Pipe Plug.

In the accompanying illustrations we show a new plug for stopping cast iron service pipes, which is being put on



Streeter's Pipe Plug —Fig. 1.—Showing Plug in Pipe.

the market by D. A. Streeter of Waterbury, Conn. In laying large cast iron pipes it is often desirable to test them before the work is entirely completed, particularly

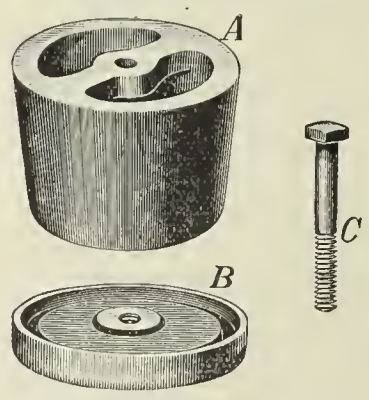


Fig. 2.—The Parts of the Plug.

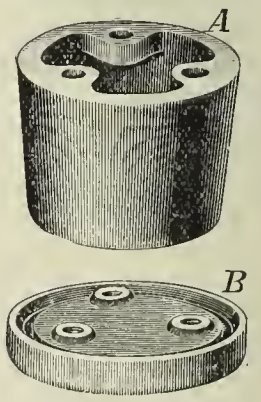

Fig. 3.—The Parts for Large Plugs.

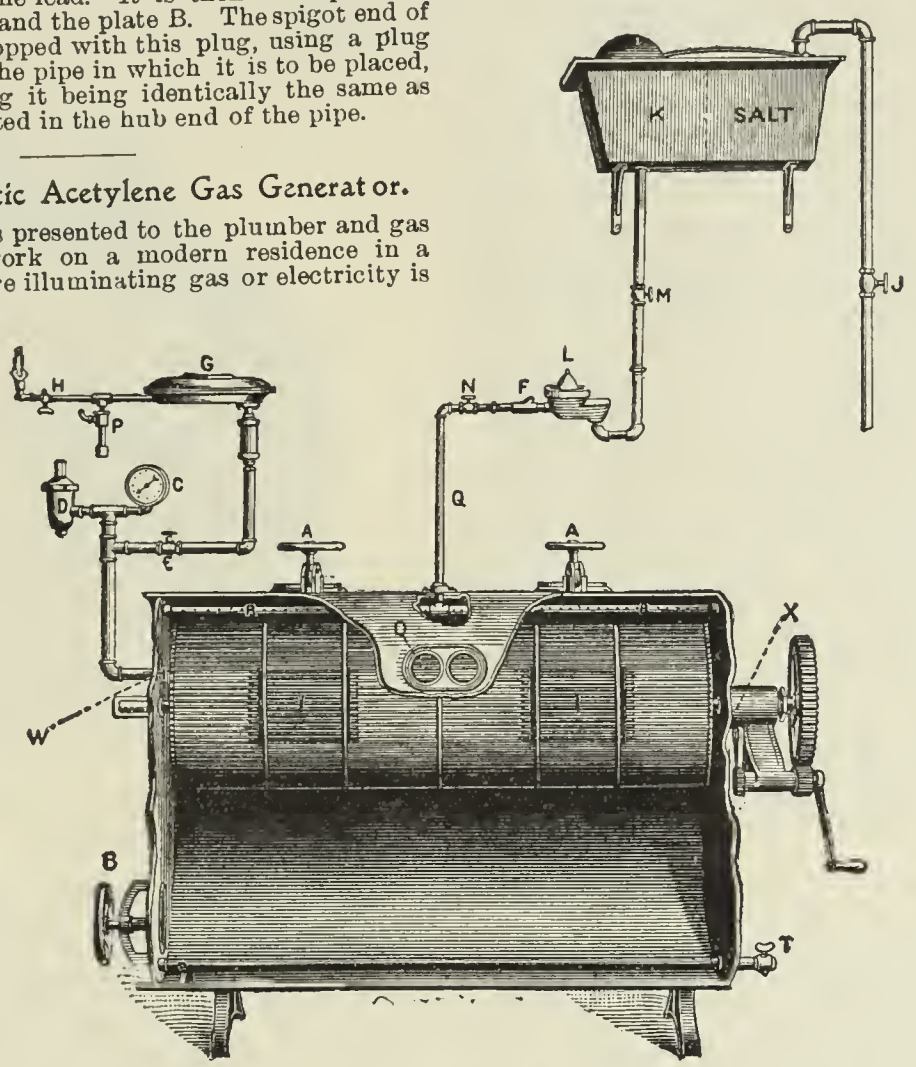
when they are water service pipes in the street and below the surface, so that they must be covered. Fig. 1 shows a section of pipe with the plug in position. The plug is

made in three parts, as shown in Fig. 2, being composed of a shell, A, a plate, B, and a bolt, C, for holding in position. Fig. 3 shows the design of the plug for larger pipes, in which three bolts are used to hold the shell and plate together. In use the plate is inserted into the hub of the pipe and the shell secured to it by means of the bolt. The plug is then ready to be calked either with oakum or with fire clay, after which melted lead can be poured in and a calked joint made in the usual manner. After the test is over and it is desired to remove the plug it can be done by releasing the nut from the bolt, when the shell can be easily knocked out of the lead. It is then a simple matter to remove the lead and the plate B. The spigot end of the pipe can also be stopped with this plug, using a plug one size smaller than the pipe in which it is to be placed, the method of securing it being identically the same as when the plug is inserted in the hub end of the pipe.

Napheys Automatic Acetylene Gas Generator.

One of the problems presented to the plumber and gas fitter who is doing work on a modern residence in a suburban district where illuminating gas or electricity is not available is to satisfactorily light the building. One of the latest devices for this purpose is Napheys automatic acetylene gas generator, for which J. B. Colt & Co., 115-117 Nassau street, New York City, are exclusive agents. Acetylene gas is generated through the union of carbide of calcium and water. Carbide of calcium has been found to have a remarkable affinity for water, and on their uniting the gas known as acetylene is generated. If the water and the carbide, as it is familiarly known, and the gas are left in the same receptacle the generation may continue until considerable pressure is developed, but if after the gas is generated both the water and the carbide are removed, or the water alone is removed, no further generation will take place and consequently no pressure can be developed which might cause trouble. The experience of those who have been investigating the use of this material with a view of producing machines has been unanimous on this point. In the construction of the automatic acetylene gas generator, a broken view of which is shown in Fig. 1, the amount of water which is brought in contact with the carbide of calcium is governed by the pressure generated in the machine. The latter consists of an outer tank in which is suspended on a shaft a cylindrical wire cage with doors, I I, in one side through which the carbide of calcium may be placed after passing through the ports A. The water to induce the generation of gas enters the cylinder and is sprayed upon the carbide through a perforated pipe, R, so that instead of the carbide coming in contact with a large quantity of water the latter is sprayed on only in sufficient quantity to maintain a pressure controlled by an automatic regulator, G. Immediately on the pressure rising to a fixed point an automatic water regulator, L, shuts off the water supply, so that in turning out the burners all through the house the water that is already in the generator will unite with the carbide and generate a sufficient pressure to shut off the water supply. Then owing to there being no water in the generator it is impossible for a high pressure to be developed.

The crank is attached to the shaft on which the wire cage is supported, so that after the outer surface of the carbide has become calcined the cylinder may be agitated to shake off the outer accumulation and to bring new and fresh surfaces in contact with the moisture in the generator. The frequency with which this must be done depends upon the size of the machine. A heavy glass window, O, is placed on each side of the generator, so that the owner may look into the cylinder and see the condition of the charge of carbide in the cylinder and thus become aware of its need of replenishment. An opening, B, is placed in the bottom of the cylinder through which the refuse may be removed, and it is claimed that in this machine the refuse is comparatively dry and almost free from any disagreeable odor, so that it may be disposed of in the same manner as ashes from the fires in a house.



Napheys Automatic Acetylene Gas Generator.—Fig 1.—Broken View of Generator.

Fig. 2.—An Acetylene Gas Burner.

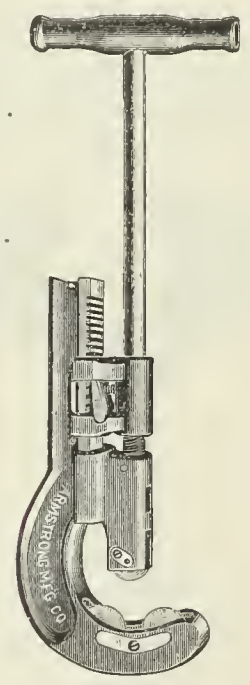
On being generated the gas passes to the house mains through the pipe W, on which a safety valve, D, and a pressure indicator, C, are placed. There is also a stop cock to shut off the gas. Beyond the stop cock is a pressure regulator, G, and an additional mercury blow off valve for further safety. It is explained that both safety valves should be piped to blow off out of doors, so that the escaping gas can do no harm, and that a whistle may be connected to attract attention, so that the cause of the unnecessary pressure can be removed. The water is supplied through an auxiliary tank, which may be

salted, if exposed, to prevent freezing. A check valve, F, is so arranged as to prevent the gas backing into the water supply. Cock T is placed at the bottom of the casing to allow the air to escape when the generator is put in operation. When connected and in operation any gas that may escape is readily detected by the peculiar odor, which closely resembles garlic.

In burning it is necessary to have an especial burner, a very small quantity of acetylene gas furnishing a far brighter light than the ordinary gas light and entirely free from smoke. In Fig. 2 is shown the burner which from experiment has been found to be best adapted for this gas, the latter issuing from two openings and uniting at an angle. By this means it unites with a larger percentage of atmospheric air than would be the case if only one jet was used. The flame is not easily extinguished and the light in many respects has qualities similar to that of bright sunlight, being adapted for use in magic lanterns and for other purposes in which only the arc light or lime light has heretofore been used. In cost to the user it is said that acetylene gas is considerably cheaper than the ordinary gas, and a unit scale, given on circulars prepared by the house, gives a very clear idea of their estimate of its expense in comparison with other methods of illuminating. The machines are made in four sizes, with capacities for operating from 20 to 250 lights. The capacity of the machine is such that on being once charged, when a proper size is selected for a given building, it is unnecessary to recharge the machine for three or four months, so that the care of the machine is simply the turning of the crank of the cage occasionally to bring new surfaces in contact with the water spray. It is claimed by the manufacturers that the construction entirely removes all possibility of danger in the use of carbide of calcium for the generation of illuminating gas, and hence the machine is well adapted for use in all kinds of buildings. They further claim that the cost of the gas and the quality of the light afforded will appeal to those who investigate its merits and make a comparison of its efficiency with other methods of illumination. The company, in addition to circulars fully describing the machine and giving directions for setting it in operation, publish a little pamphlet entitled "Acetylene Gas: Its History and Utilization," by Dr. W. H. Birchmore, who has made a specialty of research in this field.

New No. 3 Armstrong Pipe Cutter.

An improved form of their No. 3 pipe cutter, which is illustrated in the accompanying engraving, is made by the Armstrong Mfg. Company, Bridgeport, Conn. Special claims for this tool are made on account of its strength and rapidity of working, and it is pointed out that it will take a particularly large range of pipe, from 1½ to 4 inches, inclusive. The change from the smallest to the

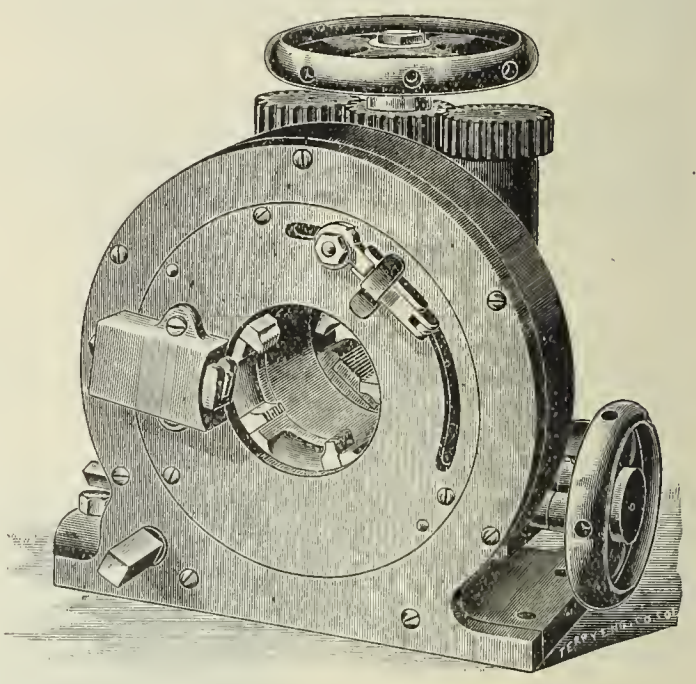


New No. 3 Armstrong Pipe Cutter.

largest size is made by simply raising a pawl and allowing the hooked bar to slide outward. To change to a smaller size the hooked bar is pushed in to the required size, when it is ready to cut. The thread on the handle is only used to follow up the cut as the cutter is revolved about the pipe. This cutter may be changed from a three-wheel to a one-wheel cutter by simply substituting rollers in place of the two cutter wheels at the end of the hooked bar. Full information will be furnished our readers upon application either to the home office of the Armstrong Mfg. Company, at Bridgeport, Conn., or 139 Centre street, New York City.

The Columbus Portable Hand Pipe Threading and Cutting Machine.

The portable hand pipe threading and cutting machines built by the Columbus Machine Company of Columbus, Ohio, have positive quick opening and closing dies, combined universal automatic or hand feed automatically gauged cutting off knife and geared self center-



The Columbus Portable Hand Pipe Threading and Cutting Machine.

ing vise. The frame is integral, and within it the gearing, die head and vise are journaled in perfect alignment. Power is applied by ratchet lever or extensible crank, or by the simultaneous use of two cranks, the side crank being an important feature for cutting off. Worm gear engagement of the die head with a frictionally retained hand wheel shaft gives universal automatic feed or rack and pinion movement at will.

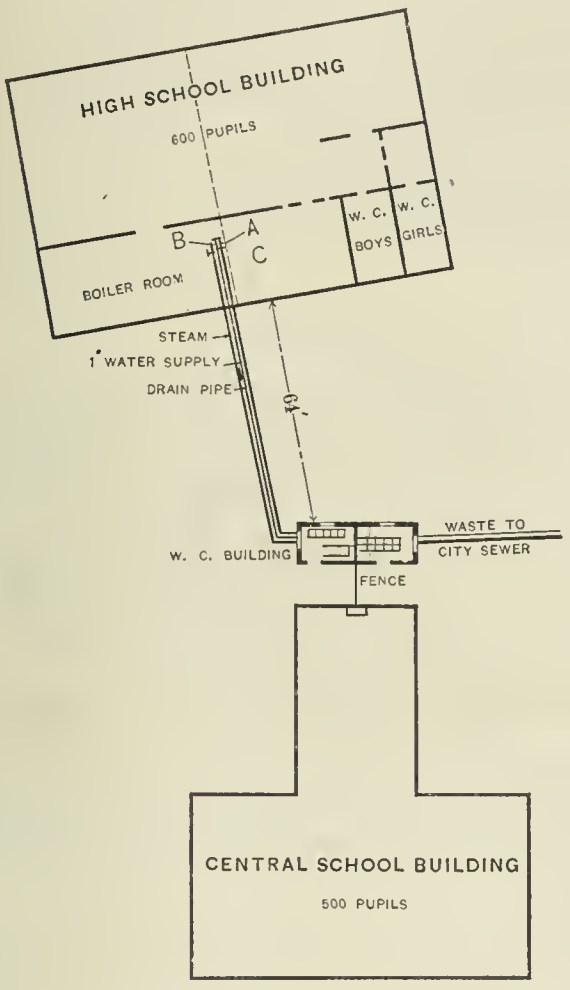
In operation the pipe is held stationary, the die head traversing the space to be threaded. The chasers have cam movement controlled by knee joint lever adjustably secured to permit of graduation to size, and by which the chasers can be instantly opened and positively closed. Five chasers are used to a set, which insures truer threads than sets of less number. They are readily interchangeable and can be resharpened by grinding. The machine illustrated is made in three sizes: No. 2 has two sets of chasers, for threading pipe from 1 to 4 inches; No. 3 has three sets of chasers, for threading pipe from 1 to 6 inches, and No. 4 has three sets of chasers, for threading pipe from 2½ to 8 inches.

A New Illuminant.

The United States Consul, P. D. Duester, writing from Crefeld, under date of October 29, to the State Department, reports upon a new discovery in illuminating as follows: Mr. Ernest Salzenberg, director of the gas works of the city of Crefeld, has invented an improvement in incandescent gas burners, which relates to the production of incandescent gas light, based upon the discovery that when the pressure of the gas is considerably increased upon the incandescence body the said body emits a golden yellow light, very agreeable to the eye, displaying objects in their natural colors. The gas is supplied to the burner at a pressure of about 3½ atmospheres, the burner, to withstand this high pressure, being of special construction. A single incandescent jet of the ordinary size can emit a light of much more than 1000 candlepower. The light is of such intensity that a person is enabled to read the finest print at a distance of 100 to 150 feet. The inventor claims that the cost of his incandescent light of 1500 candle-power is only 4½ cents per hour, while that of the ordinary electric light of 400 candlepower is (in Germany) 14 cents per hour. In the apparatus constructed by Salzenberg a hydraulic pressure of 3.5 atmospheres, and even more, may be forced through the improved Auer burner. The invention is, however, only applicable where water works exist. Mr. Salzenberg has already applied for letters patent in the United States.

SCHOOL HOUSE PLUMBING IN COLD CLIMATES.

In cold climates where the thermometer registers a temperature of several degrees below zero and remains there for several days the designing of a plumbing system that will prove equally satisfactory under such temperatures and also those of summer is a matter of some importance and attended with difficulty. We are enabled, through the courtesy of A. R. Brink, to present an illustrated description of a system to meet all conditions of weather, devised and installed by him in a school house at



School House Plumbing in Cold Climates —Fig. 1.—Plan of School Grounds, Showing Closet Building.

Red Wing, Minn. In Fig. 1 we present a plan of the school house grounds. The original intention was to install the plumbing system in the basement of the central school building, but the objection to the insanitary conditions that might be possible with the best of care disposed of this idea, and a non-freezing system has been put in an outhouse building, located as shown, which has a vault 7 feet deep. At the time the alterations were being made to the school buildings, before the present closet system was installed, the steam heating system was planned for heating all the buildings on the lot and thus enable the use of the basement, which had been intended for the water closet, for other purposes.

The outhouse building is made of brick, with 12-inch wall, and the drawings reproduced here were made to bring the matter before the School Board, and meeting their approval the work has been completed as here described. It has been finished for over a month and the closets have been in use by over 900 pupils, who had been using common newspapers and writing paper in place of the regular toilet paper which the School Board intends to provide, all of which proves the practicability of the system. The feature of the system is the Kenney flushing valve, made by the Kenney Sanitary Mfg. Company, 47 Dey street, New York City. Mr. Brink says in the course of his description: "I wish to state that had not an illustration of this valve appeared in *The Metal Worker* at the time that I was casting about for something adapted for the purpose it would not be in such satisfactory use here now. It was the intention the day that I saw the illustration of the valve and read the description to order some dumping tank to flush the closets, but I decided to inquire as to the adaptability of these valves for my purpose and the result of the correspondence has been their use, so far satisfactory in every respect." Fig. 2 is a plan of the closet building, with the girls' closets separated by a partition wall from the boys' closets and urinals. Fig. 3 is an elevation showing the arrangement of the closet troughs, the flushing valves and the method of draining the entire piping system so as to leave no water in them to freeze.

The building is heated during the hours when school is in session. At the close of school the steam and water to the closets and the building are shut off by means of valves at A, B and C in the boiler room, as shown inFig. 1, the steam, water and drip pipes being run inside of a 15 inch tile pipe packed with mineral wool. When the valve A, in Fig. 3, on the water supply is closed the drip cocks C and B are opened and all the water drains out of the closet building, the steam being shut off at the same time. These water pipes need only be drained in severe cold weather. There is no water at all in the closet vault above the pit or below the floor, except when the flush chain is pulled. The water closet troughs are made of No. 16 galvanized iron, 9 inches deep at the flush end and

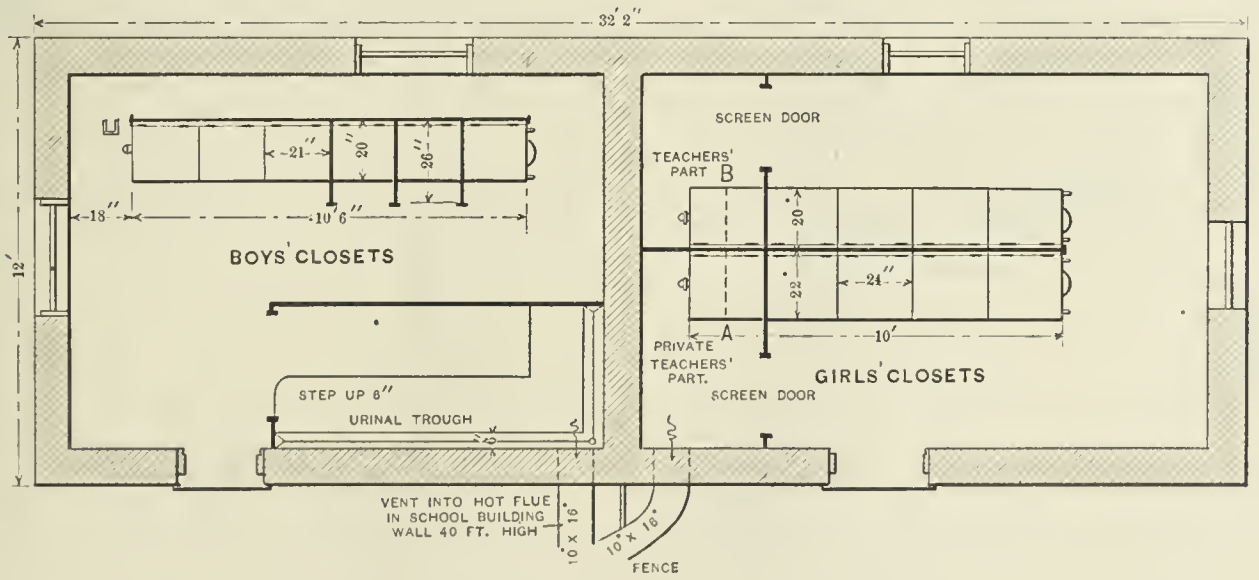


Fig. 2.—Plan of Building, Showing Location of Closets and Urinal.

14 inches deep at the outlet end. They are coated with two coats of pure red lead and boiled linseed oil, after which two coats of enamel paint are applied. There is a water spray the whole length of the trough on each side, as shown in Fig. 4, which is an elevation on the line A B of Fig. 2, the galvanized iron trough being shown under the seats, and up near the seats are perforated copper pipes used for spraying and washing the sides of the

trough. The discharge from the closet troughs is made through 4-inch extra heavy cast iron waste pipe which runs to the sewer, a 4-inch trap being placed between the flushing trough and the sewer, as shown. No vent pipes have been placed on the sewer side of these traps, as is usually done, because there is enough water running after the flush to fill the traps. In case the flush water does siphon from the trap outlets provision has been made for attaching the vents, but after using the closet for a month it has been found that the vents are not needed.

In order to prevent the freezing of the traps they are inclosed in a double brick chamber having a 4-inch air space between the inner and outer walls, both chambers being covered with a wooden cover. The back and trough of the urinal in the boys' closet, an elevation of which is shown in Fig. 5, is made of No. 22 galvanized iron, coated with three coats of enamel paint; also the guard S at the top, which incloses the water spraying pipe. The back is bent up at the bottom, so that there will be no iron that is uncoated exposed to the action of the urine. A step 6 inches high is placed along the urinals, so that those who use it will be as close to the back as possible. The iron back is supported by cleats riveted to it and resting on supports furnished in the wood work. The board B is fastened on the top of the step to the urinal by means of brass screws, so that it can be removed when it becomes worn or saturated. A ½-inch pipe is brought up from the main water service to the top of the urinal back and behind the guard S, where it connects with a perforated pipe which continually washes the surface of the back. The water service from the street is connected with the two Kenney valves, as shown, and with the urinal spray and the seat spray, located as shown in Fig. 4.

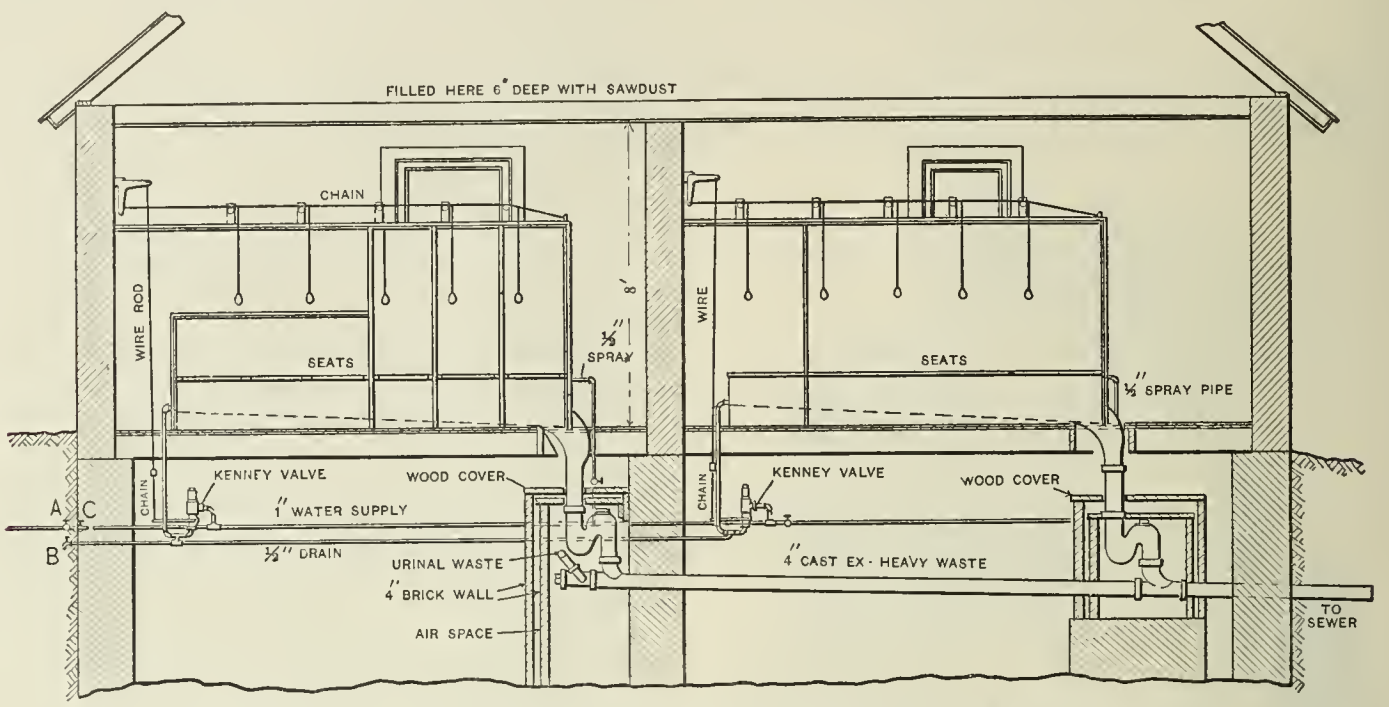

Fig. 3.—Elevation, Showing Flush Troughs, Valves, Trap Chambers and Method of Draining.

The water service carries a pressure of 90 pounds and the Kenney valves are regulated to operate under this pressure. The levers operating the valves are connected by means of cranks with a shaft on which arms are provided, so that the valves can be operated from any closet, chain pulls being connected with the crank arms for this purpose. It will be seen from this arrangement, shown in Fig. 3, that below the floor line of the closet room is an air space in which the valves are located, and that except when the valve lever is operated there is no water in the

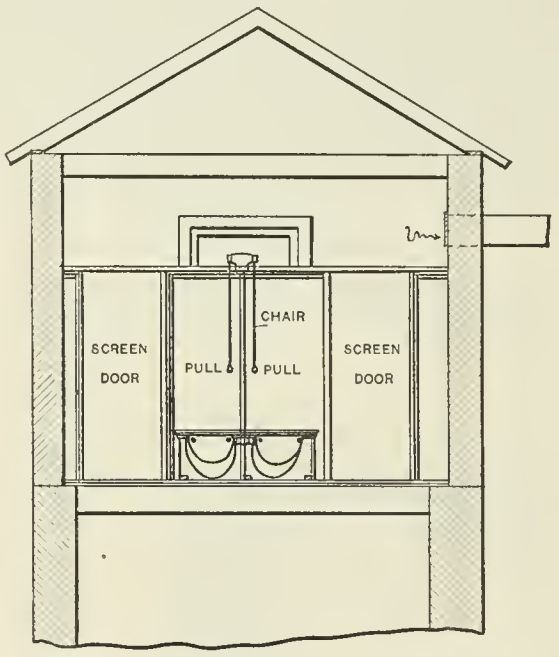

Fig. 4 —Elevation on Line A B Fig. 2.

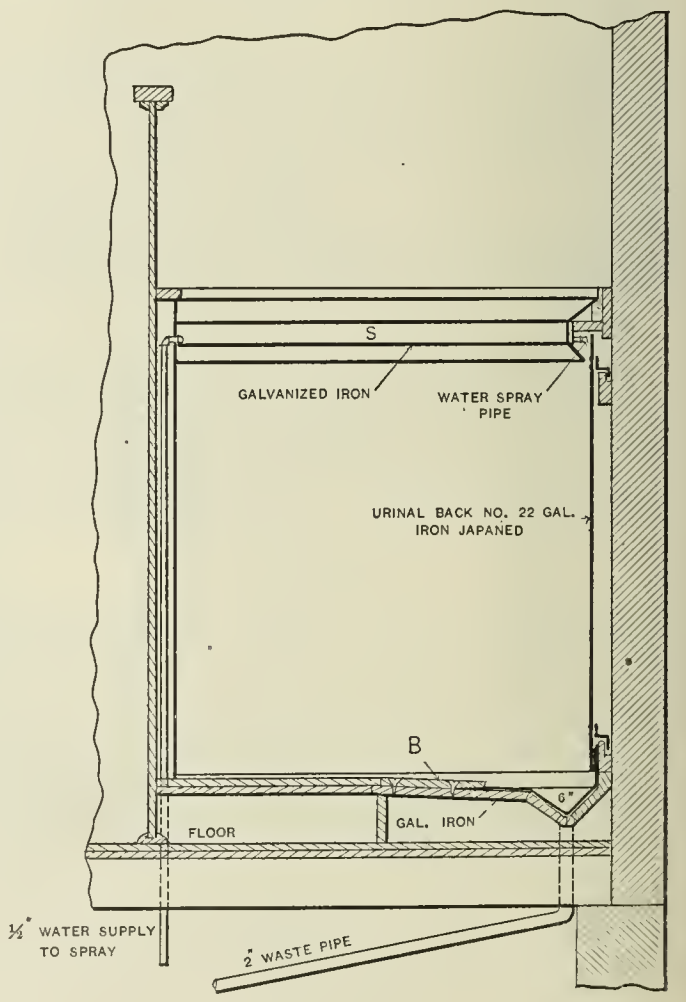

Fig. 5 —Sectional Elevation of Urinals.

valves or the piping to the closet, all being drained off by the pipe B as soon as the valves close. The valves being located below the surface of the ground in a comparatively warm chamber, and as there is no water in them, there is nothing to freeze, but in ordinarily cold weather there will be no danger from freezing even if not drained. All provision is made, however, so that when the janitor makes his rounds of the school building after school is dismissed in the afternoon it is a simple matter for him to manipulate the valves so that every drop of water will be drained out of the system at the same time that he shuts off the steam. The local vent for each of the closet rooms is connected with a large vent flue which is located at the back of the central school building. This flue is used only for ventilating these closet rooms and is warmed with steam pipes from the mains which supply the school buildings.

NOTES.

In response to a call from the master plumbers and master steam fitters in the district comprised in Greater New York there was a large attendance of manufacturers of plumbing and steam goods at the Hotel Windsor, New York, on Thursday afternoon, November 18. As the result of a proposition made for better trade protection there will be a meeting of manufacturers next week and a further conference for the purpose of finally adjusting matters at a later date.

Thomas J. Rice has recently opened a store at 538 State street, New Haven, Conn., and is prepared to execute high grade sanitary plumbing. Mr. Rice has had considerable experience in the business and has worked for the past seven years with Daniel M. Sheehan.

The contracts for the plumbing and heating in the new building of the Milford Land & Cottage Company, on Center street, have been awarded to Disley & Weyand, Waterbury, Conn., the New England Engineering Company having the electrical work.

The plant of H. R. Barker Mfg. Company, Lowell, Mass., was visited by fire on November 12. The building was not badly damaged, but a considerable loss on the stock was sustained, amounting to about $10,000, fully covered by insurance. Rats and matches are given as the cause of the fire.

Some considerable orders for Iron and Brass Fittings for steam purposes have recently been received in New York from Japan.

An inspection of the plumbing fixtures made by the Dalton-Ingersoll Company, 169-175 High street, Boston, Mass., reveals the care taken by the company in the manufacture of these appliances and the originality and inventive talent that has been displayed in modifications to increase their efficiency. In the line of closets they offer to the trade there are a number of special features that will appeal to the progressive plumber. One style of high grade closet is made with a combined flush and vent rim, the exhaust being drawn from the entire circumference of the bowl and carried to the ventilating stack at the back through a wide free channel which secures the thorough removal of the air in and around the closet. Another efficient modification of a closet bowl introduced by this concern is a small rib on the front of the inside of the bowl which equalizes the flush and secures the complete emptying and scouring of the bowl.

Prof. S. H. Woodbridge of the Massachusetts Institute of Technology is in Washington by request of the House Committee on Ventilation and Acoustics to prepare plans for ventilating the Hall of Representatives. It will take ten days or more to make a study of the situation and prepare plans, which will be submitted to Congress, and if approved the work of carrying them out will be under taken during the recess next summer.

We have received from the Judson A. Goodrich Company, 120 Beekman street, New York, a circular of their Climax Automatic Air Valves, which is marked Advance Circular No. 1, and also bears their trade mark, which is a globe suspended over a bowl with steam jets pouring out from opposite sides to keep the globe in motion. The company make a specialty of high grade steam specialties, and two pages are devoted to the Climax Valve, recently illustrated in *The Metal Worker*. The last page shows a number of Compression Radiator Air Valves which are designed to be operated either by a wood wheel or a key in places where it is desirable to prevent the manipulation of the Air Valves by occupants of a building.

The master plumbers of Norfolk, Va., held a meeting at the Atlantic Hotel last week and organized for the purpose of mutual protection. The meeting was presided over by James F. Traynor of Wilmington, Del. The following officers were elected: E. L. Guy, president; Robert F. Lawler, secretary; Thomas J. Carey, treasurer; Thomas J. O'Connor, sergeant-at-arms.

James Dicks has entered into partnership with Charles Gensley in the plumbing business at Newark, Ohio, and the firm will hereafter be known as Gensley & Dicks.

Samuel Dusaume, for many years with Cyrus Spaulding, will start in the tinning and plumbing business for himself, with a shop on Prospect street, Webster, Mass.

Bennett & Hammer, Great Barrington, Mass., have the contract for the steam heating plant in the Berkshire Inn annex.

The Salem, Mass., Board of Health held a meeting and accepted the resignation of John H. Chambers, Inspector of Plumbing. Lawrence E. Millea was elected Inspector *pro tem.*

Edward Rudderow of the late firm of A. L. & Edward Rudderow has started in the plumbing business for himself on Centre street, Camden, N. J.

D. A. Dunbar, Visalia, Cal., is building a workshop in the rear of his hardware store for his increasing plumbing business.

The D. M. Quay Company of Chicago and New York have secured the contract for the plumbing and drainage system for the new Chamber of Commerce Building at Cleveland, Ohio.

The Wolfe Ventilating & Heating Company of Boston, Mass., have been awarded the contract for heating the new Grammar School Building at Southbridge.

Birney & Cross have erected a fine new building for their plumbing business at Chester, Pa.

The Governor of the State of Indiana is giving his attention to the waste of natural gas in various places where it is used throughout the State, and steps will be taken to prevent the loss. Complaints have been filed with the Governor from various sections that the waste has been sufficient to supply the State with all the gas it could use for a year.

We have received from F. Wild, secretary of the Association of Master Plumbers of El Paso, Texas, copies of letters prepared by the association for use before the City Council, who recently interposed some opposition to an ordinance for the regulation of plumbing. The objects of their association and the benefits which have attended the adoption and enforcement of ordinances regulating plumbing are presented in a masterly manner.

A recent issue of the *Gazette* of Geneva, N. Y., shows a picture of the Vance Steam Heater, made by the Vance Boiler Works, Geneva, N. Y., and exploits the merits of the heater and also presents a testimonial letter from a hotel keeper, who states that he consumes 90 pounds of range coal in 24 hours for heating 600 feet of radiation in 17 rooms of the house, without having the gauge register a pound of steam.

The Leavitt Machine Company of Orange, Mass., have opened an office at 54 John street, New York, under the management of Carl W. Hunt, who will look after the interests of the Morse & Dexter valve reseating specialties in this vicinity. These machines enable the possessor to repair leaky valves with very little expense, and will prove a money saving appliance in the workshop of all large steam heating concerns, and also of heating contractors who do repair work.

We learn from M. A. Foote, 54 John street, the New York office of the Powers Regulating Company of Chicago, that their system of temperature regulation has been adopted for the Post Office Building at Omaha, Neb. The system will cost $3500 and is an evidence that among engineers the value of temperature regulating systems is being recognized.

H. W. Littell is now representing Miller & Coates, 279 Pearl street, New York, among the plumbing trade, presenting the merits of their line of plumbing specialties.

T. Holland of the Holland Radiator Company of Chicago was a visitor among the heating trade in New York this week. On his return his son E. Holland will join him and again be interested in the sale of Steam and Hot Water Radiators.

P. J. Baker, 273 Pearl street, manager of the New York office of the Watertown Brass Mfg. Company of Watertown, N. Y., in addition to the various specialties in brass goods made by the company, is showing Enameled Cast Iron Bathtubs, made by the Derwent Foundry Company, Ellwood City, Pa., and by the Victor Mfg. Company of Pittsburgh, Pa. One of the Victor Tubs is adapted to the small bathrooms of apartment houses, being quite short and wide, and is said to be very popular with the users.

We are advised by Herm. Weissenburger & Co., Cannstatt, Germany, that arrangements are being made in Cannstatt for an exhibition of everything relating to acetylene gas. It is proposed to show all the different forms of Generators, Lamps, &c., and we understand that the exhibition promises to be well patronized by manufacturers and consumers.

We have received from Henry C. Weeden, 427-445 Commercial street, Boston, Mass., a programme of the entertainment he proposes to furnish for his patrons on the anniversary of the opening of his warerooms of plumbing goods, which are claimed to be the largest in New England, which will take place on February 1, 1898. A feature of the entertainment will be the distribution of 13 fine paintings, some by old masters, among those of his patrons who have dealt with him from November 1, 1897, to February 1, 1898, and who on that occasion will be invited guests. These paintings are now on exhibition in his showrooms, and in addition there is a "mysterious painting" which shows clearly that it is of great age, and some art critics have suggested that it was painted by Rubens. The owner, who is desirous of finding out if it is a genuine Rubens, has decided to exhibit it throughout the United States, and offers $1000 in cash to any one who can tell what the subject of the painting is and identify and prove it to have been painted by Peter Paul Rubens. By exhibiting it Mr. Weeden gives his patrons an opportunity to win this prize. The other paintings on exhibition will be distributed among the guests by a method to be determined by Mr. Weeden.

We understand that the recent explosion of a steam heating boiler at Waltham, Mass., was due to the weighting down of the safety valve to keep it from blowing off. The boiler has been replaced by a Doric boiler.

C. P. Quigley, formerly in the service of John Funkey, Sr., has started in the plumbing business for himself at Hancock, Mich.

Kinnear & Co. have bought out the plumbing establishment of John Dixon on North Court street, Rockford, Ill., and moved it to South Court street.

The Standard Steam Specialty Company is a new house at 83 Centre street, New York, that has purchased from G. I. Roberts the patents and will manufacture the Utility and Midget Pump Governors. They will manufacture Steam Specialties for high and low pressure systems. Herbert A. Joslin, who is well known to the trade, is president of the company.

J. R. Weber & Co., successors to W. H. Davis in the wholesale and retail Hardware business in Quakertown, Pa., have enlarged the store and put in new shelving. They have also increased their show window space. They advise us that they will add a plumbing, gas and steam fitting department after January 1 next.

Massachusetts Gas Fitting Law.

Chapter 265 of the acts of the Massachusetts Legislature of 1897 relates to licensing gas fitters and supervising gas fitting in the city of Boston, and is as follows:

Section 1. No person, firm or corporation shall engage in or work at the business of gas fitting in the city of Boston after the first day of October in the year eighteen hundred and ninety-seven, either as employer or as a journeyman, unless such person, firm or corporation has received a license therefor in accordance with the provisions of this act. The word "journeyman," as used in this act, shall be deemed to mean one who personally does any gas fitting, or any work in connection therewith, which would be subject to inspection under the provisions of this act.

Sec. 2. Every person, firm or corporation desiring to engage in the business of gas fitting in the city of Boston shall make application therefor to the building commissioner, and shall, at such time and place as may be designated by the board of examiners hereinafter provided for, to whom such application shall be referred, be examined as to his qualifications for such business.

Sec. 3. The board of examiners shall consist of the building commissioner, the chairman of the board of health, who shall be *ex-officiis* members of said board and serve without compensation, and a third member, to be chosen by the board of health, who shall be a practical gas fitter of at least five years' continued practical experience during the years next preceding the date of appointment. Said third member shall be chosen within thirty days after the passage of this act, for a term ending on the first day of May in the year eighteen hundred and ninety-eight, and thereafter annually; and he shall be allowed a sum not exceeding five dollars for each day of actual service, to be paid from the treasury of the city of Boston.

Sec. 4. Said board of examiners shall, as soon as may be after the appointment of said third member, meet and organize by the selection of a chairman and a clerk, and shall then desginate the times and places for the examination of all applicants desiring to engage in or work at the business of gas fitting in the city of Boston. Said board shall examine said applicants as to their practical knowledge of gas fitting, shall submit the applicant to some satisfactory form of practical test, and, if satisfied of the competency of the applicant, shall so certify to the building commissioner, who shall thereupon issue a license to such applicant, authorizing him to engage in or work at the business of gas fitting, first requiring him to register in the office of said building commissioner his name, place of business or residence, license number, date of examination, and in what capacity licensed. In case of a firm or corporation, the examination of one member of the firm, or of the manager of the corporation, shall satisfy the requirements of this act. The fee for the license of any employing gas fitter shall be two dollars, and for a journeyman, fifty cents; and said license shall continue in force until revoked or canceled, but shall not be transferable.

Sec. 5. The building commissioner shall appoint, after the first day of October in the year eighteen hundred and ninety-seven, such a number of inspectors of gas fitting as the board of examiners may from time to time determine. Said inspectors shall be practical gas fitters of at least five years' continued practical experience, and shall, before appointment, be subject to an examination before the civil service commissioners. The compensation of said inspectors shall be determined by the building commissioner, subject to the approval of the mayor; and such inspectors shall hold office until removed by said commissioner, with the approval of the mayor, for malfeasance, incapacity or neglect of duty. Said inspectors shall inspect all new work relating to gas fitting in new and in old buildings, the connections and use of such work, and shall report all violations of this act or of any act or ordinance relating thereto, which now exists or may be hereafter enacted or ordained; and they shall also perform such other appropriate duties as may be required by the building commissioner.

Sec. 6. Every licensed gas fitter shall display his license number conspicuously at his place of business.

Sec. 7. On and after the first day of October, in the year eighteen hundred and ninety-seven, no building shall be piped or fitted for gas, nor shall any repairs be made in such piping or fittings, nor fixtures placed, unless a permit shall be granted therefor by the building commissioner. Every licensed gas fitter desiring to perform any work relating to piping or fitting a building for gas, or to repair gas piping or fittings, or to place fixtures therein, shall file application therefor at the office of the building commissioner, giving the correct location, name and address of the owner, the intended use and material of the building, and a full and complete statement of the work proposed and material to be used, and shall, if required by said building commissioner, furnish a plan thereof, which shall be subject to his approval. All materials used and work performed under the provisions of this section shall be subject to such regulations as shall be made by the board of health and the building commissioner.

Sec. 8. No gas pipe which may be introduced in any building shall be let into the timbers, beams or girders, unless the same is placed within thirty-six inches of the end of said timber, beam or girder, and in no building shall the said pipes be let into the timbers, beams or girders more than two inches in depth. No person shall disconnect or remove any gas meter, except the duly authorized representative of the gas company owning such meter.

Sec. 9. All gas brackets shall be placed at least three feet below any ceiling or wood work, unless the same is properly protected by a shield, in which case the distance shall not be less than eighteen inches. Nothing in this act shall be construed to affect the operations of any gas company upon its own premises or upon its mains and surface pipes.

Sec. 10. The board of health of said city by its inspectors shall from time to time, as it deems proper, inspect the gas fixtures and appliances in any building, and shall make such requirements relating thereto as it deems the public health requires, and the owner of such building shall comply with such requirements.

Sec. 11. Any person violating any provision of this act shall be deemed guilty of a misdemeanor, and shall be subject to a fine of not exceeding one hundred dollars for each offense, and if such person has received a license under this act his license may be revoked by the building commissioner.

Sec. 12. The building commissioner shall include in his annual report to the city council a report of the proceedings of the building department under this act, and shall include therein a report of the board of examiners appointed under this act, giving their proceedings during the year ending on the first day of February.

Sec. 13. All acts and parts of acts inconsistent herewith are hereby repealed.

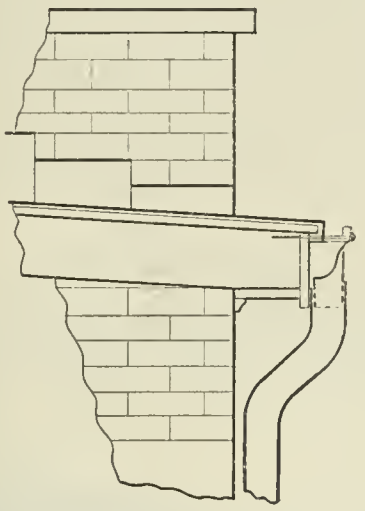
Sec. 14. This act shall take effect upon its passage, except so far as is hereinbefore otherwise provided.

SHEET METAL WORK.

Hints About Roofing.

BY OLIVER TWIST.

Felt and gravel roofing is adapted to great extremes of climate, and is found in successful use from New Orleans to the frozen north; and yet we find, here and there, poor roofs of this kind, just as we find poor tin, slate and galvanized iron roofs. The writer has often met the query, "What is your opinion of a certain kind of roof?" Well, every kind of roofing has its champions, and some possess commendable features not found in others; but, without



Hints About Roofing.—Fig. 1.—Section through Gutter.

discussing the merits or demerits of each, it is clear that to obtain desirable results there must be good materials, good workmanship, and the shape of the roof must be suited to the covering.

If you wish a house roofed with British Columbia shingles, then you would give it a fall of 9 or 12 inches to the foot; if you would have a roof almost flat, then wood and metallic shingles, slates, &c., are out of the question, and something must be chosen whose component parts may be so joined as to form one continuous water tight

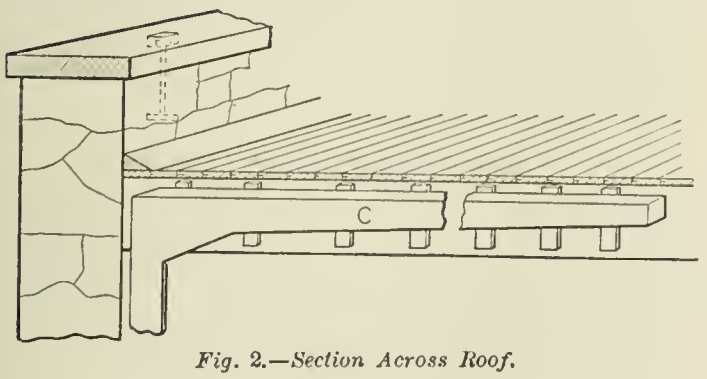


Fig. 2.—Section Across Roof.

piece, not liable to become broken at any seam or any other point through changes of temperature, wind storms, &c. If a client or architect desires a certain shape of roof he must select a material which can in every way conform to that shape with satisfactory results. If he will have a specific material, then the shape must be subservient.

Very good. These are only elementary principles, you say. But apply them to the poor roofs and it will be found that it is in their violation that the trouble began. This man has used rough, undried, unplaned lumber for a basis, when he should have had it with a tongue and groove joint, planed and dry. "It's cheaper, and I don't know that it makes much difference," he says. However, it does make a difference, as he finds later on; more so, perhaps, with some materials than others.

Here again we find one who has invested in a new kind of ready roofing, and the men who are working in the roofing business at that place have had no previous experience with it, or he may think himself capable of doing the work with a little help, as it is said to be easily applied. The roof is steeper than it should be, to begin with, and the felt is lapped 1 inch where it should have 2 or 3 inches, and, being put on with nails and tin washers, it happens occasionally that a few are driven between the joints of the sheathing.

The chimneys and skylight give a little trouble, but by and by the job is complete, but the very next summer it needs fixing. The sun caused the protecting covering of tar and sand or "paint" to run off owing to the excessive amount of fall, and the felt withered up, the top layer "crawled" away from its neighbor, leaks were plentiful, and after being fixed and fixed without avail had to be removed.

Experience has taught that in severe wintry climates (for dwellings, stores, &c., having a flat roof) it is preferable to drain through a conductor pipe placed within the building. Fig. 1 shows the eave of a felt roof, which has a continuous fall from front to rear of building, with an

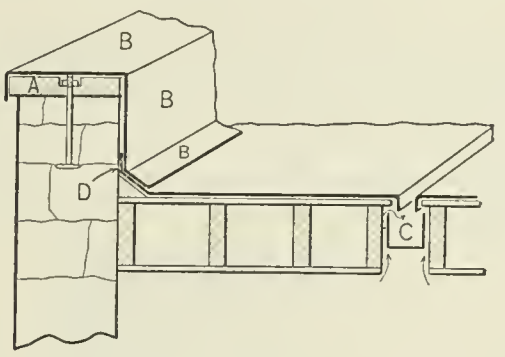

Fig 3.—Showing Finish Around Fire Wa

ogee eave trough spiked to the rafters and a conductor outside of building.

The great trouble with this type is that a ridge of ice will be sure to form along the eaves, which will dam back the water and form a miniature lake. Fig. 2 shows a method which was designed to overcome this. A galvanized trough was made 6 inches wide, extending across the roof more than two thirds of its width, and supported between the joists as in Figs. 2 and 3 by being nailed to wood strips in such a way as to admit a current of warm air from ceiling around the trough and out, as shown by the arrows. The roof has a fall toward the gutter C from both ends equal to $\frac{3}{8}$ inch to the foot. The conductor pipe and trough were by this means kept free from ice throughout the winter.

The finish along a fire wall is often a cause of trouble. In Fig. 3 is shown a stone wall of a building used as an engine house. A hardwood plank 3 inches thick is bolted to the stone work, its inner face flush with wall, its outer edge projecting 2 inches. A triangular strip of wood is placed in the angle of wall and roof, and the felt well secured there with hot pitch. The coping is covered with galvanized iron, extending down the fire wall and over the triangular strip, which thus protects the felt from the direct rays of the sun and throws the water away from the wall. In Fig. 3, A is the wood cap or coping, B the galvanized iron covering, C the trough in section, and D the felt behind the iron.

THE ROOFING SLATE TRADE.

Notwithstanding the settlement of the long strike and a resumption of work some weeks ago, as we reported at the time, at the great Penrhyn quarries in Wales, the movement of American roofing slates to Europe has continued in heavy volume up to the present. This export trade has been of sufficient amount to make up for a comparatively light domestic consumption, and has served to keep available stocks at the quarries unusually low. At the Pennsylvania quarries, unsold stocks of slates, 18-inch and larger, are the smallest in 15 years, while small sizes of sea green and purple at the Vermont quarries are very scarce and the larger varieties of the same by no means plentiful. Bangor slates of the best quality are practically cleaned out, and as most of the quarries there and at Pen Argyl, Pa., will close about January 1 for three months or so the position of these slates is a strong one. At the present time all the American quarries are busy. The outlook for business in the coming year is regarded as favorable. Building operations of the kind where slate roofing is used have been comparatively limited in the past season, but a considerable amount is said to be in prospect for next year, and it is hoped that there will be enough expansion in the domestic consumption to offset the shrinkage in foreign orders which is likely to occur as the available output of Welsh slates increases.

At present the stocks of Welsh roofing slates abroad are very low. In fact, the market in England is almost bare of the domestic material, and the producers are understood to be so well booked up that they are refusing orders for deliveries within six or eight months. French slates, on the other hand, are reported to be accumulating to some extent, and these stocks may find an outlet in the British and other European markets which have favored the American product in the past two years. One thing which may militate against the export trade in American slates is the fact that freight rates from here to European ports are advancing sharply and may reach a level within the next few months which would make it difficult for the American material to compete with the Welsh in the European markets. As it is, the foreign consumers are taking American slates, not so much on account of their preference for them as because they are cheaper in price than the domestic product and are more readily obtainable for immediate use. Exporters of American slates report quite a falling off in orders from Europe for forward deliveries, although the contracts for prompt shipments keep up in good volume. Recent shipments have been made principally to British and German ports, but some good orders have been filled for Australia and South Africa.

Rumor has it that a combination has been formed amoug the Welsh slate producers to shut out the American material from the British market by means of a species of boycott applied to the importing firms. But the extreme scarcity of domestic roofing slates in England stands in the way of effective actiou of the kind at the present time. It is noted that the call from that quarter for American slates is confined almost entirely to the cheaper grades. The better qualities, such as Best Bangor, are too high in price for the foreign consumers. Moreover, a much rougher and poorer kind of slate is generally used for building purposes in the United Kingdom than would be tolerated by builders and owners in this country.

In regard to the Penrhyn quarries, it is reported that there is much dissatisfactiou among the men over the result of the late settlement. They claim to have been deceived in some particulars, and a renewed agitation is said to be on foot which may eventuate in another strike and shut down at Penrhyn. Should this happen, European consumers would again turn to the United States for their supplies of roofing slates, and the export trade would continue heavy for an indefinite time.

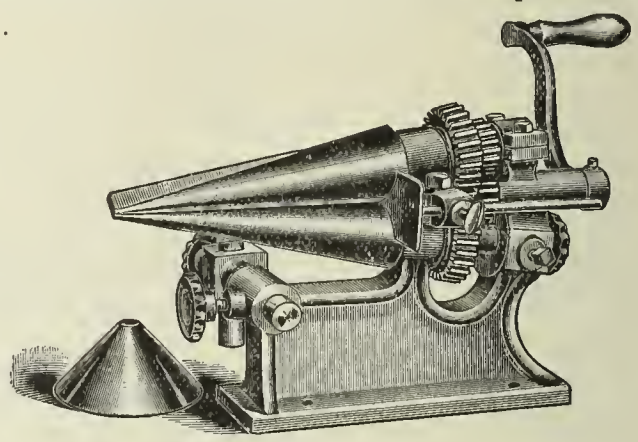
The New York Metal Ceiling Company, Twenty-first street and Thirteenth avenue, New York City, have recently completed the Metal Ceiling in the dining room and office of the Garde Hotel, New Haven; also Metal Ceilings in the Fox and Conroy Buildings, Stamford and the Berlin Savings Bank, and have contracted for Ceilings in the new library building in Winsted, Parker & Davis' store in Bridgeport and the Masonic lodge rooms in Unionville, Conn.

Table for Elbow Patterns.

We are indebted to Thomas Rooney, 239 Caledonia street, Lockport, N. Y., for a copy of his table of altitudes of sheet metal elbow patterns with directions for using the same. The book, which is neatly bound in cloth, is 5 x 8 inches in size, containing 21 pages, and with it is a supplement giving full instructions for the application of the tables. The tables were compiled from a 24-inch chart, made expressly for the work, and by their use the altitudes of the patterus can be obtained and the patterns for all kinds of elbows readily secured. The tables apply to two-piece elbows from 1 to 24 inches in diameter and 1 to 60 degrees of angle ; three-piece elbows from 1 to 24 inches in diameter and 45 to 90 degrees of angle ; four-piece elbows of similar diameters from 55 to 90 degrees of angle ; five-piece elbows of similar sizes from 65 to 90 degrees of angle, and similar tables are likewise presented for six, seven and eight piece elbows. The supplement sketches show how to draw the patterns, and with the book of tables will prove of much interest and value to tinsmiths and sheet iron workers.

Niagara Funnel Former.

The Niagara Stamping & Tool Company of Buffalo, N. Y., manufacturers of sheet metal tools, have put on the market a new machine with cone shaped rolls for



Niagara Funnel Former.

forming conical and taper work of various angles that cannot be produced on ordinary forming rolls, such as funnels, can tops, lamp shades, &c. The work is done in the usual way, by feeding the material between the front rollers, and a third roller does the bending. The third, or forming roll, is adjustable to all positions. The length of the rolls is 10 inches.

The Art Metal Relief Company.

The firm of J. F. Weitzel, Cincinnati, Ohio, manufacturers of galvanized iron and sheet metal specialties, and that of The Art Metal Relief Sign Company, Covington, Ky., have been merged into one concern by reorganization and the incorporation of The Art Metal Relief Company of Covington, Ky., as it will hereafter be known, with a paid up capital of $25,000, with J. F. Weitzel president, John G. Meyer secretary and treasurer and R. K. Kabitzch superintendent. The present plant, located at York and Pike streets, Covington, Ky., will have additional buildings put up at once, and a fine line of tinners' and builders' sheet metal specialties, also art relief work in galvanized iron, zinc or copper of every description, will be produced.

In an item in *The Metal Worker* last week, relating to this incorporation, Mr. Weitzel's name was incorrectly given and the capital stock was wrongly stated to be $5000 instead of $25,000.

James A. Towsen, a prominent citizen of Harrisburg, Pa., died at his residence in that city on November 11, aged 78 years. He was born at Lancaster, Pa., and there learned the trade of slate roofing. In 1867 he established himself in Harrisburg as a slate roofing contractor, joining the firm of Thomas Arnold & Co., and purchasing the whole interest in the firm ten years later. Mr. Towsen

was one of the best known slate roofers in Pennsylvania, receiving large contracts from the Pennsylvania Railroad Company, the Pennsylvania Steel Company and other important corporations, besides carrying out a great deal of work on public buildings. He fought in the Civil War with the Forty-seventh Regiment of Pennsylvania Volunteers, attaining the rank of quartermaster-sergeant.

FLASHINGS.

The master tinners of Memphis, Tenn., are organizing and have applied for a charter. John L. Eichberg, secretary *pro tem.*, 234 Third street, Memphis, Tenn., will be glad to receive from secretaries of similar organizations of master tinners copies of by-laws to assist the Memphis master tinners in drawing up their own.

Rohrbach & Bro., Reading, Pa., have received the contract for the Roofing and Spouting of the Orphans' Home. About 12,000 square feet of Tin will be required.

The Russell Roofing Company have been incorporated at Chicago, with a capital of $5000, by T. J. Thompson, A. E. Buck and W. W. Haight.

A press dispatch from Pen Argyl, Pa., states that the Bangor and Pen Argyl slate region is receiving a visit from English capitalists, who have formed a company to develop the American slate trade in Great Britain and on the Continent of Europe by the importing of slate from the United States. The company will be known as the American Slate Mart & Wharf Company, Limited, of London, England, and will have a capital of $500,000. Samuel Keat of Pen Argyl is named as the sole representative of the company in this country.

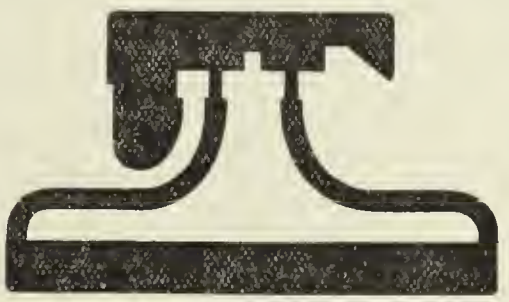
The Spontaneous Combustion of Coal.

In July, 1896, a commission was appointed by the New South Wales Government to inquire into the causes of fire in coal cargoes. In dealing with the general subject the report of the commission summarizes as follows the theory of the spontaneous combustion of coal, which it will be observed ignores the old pyrites and sulphur theory prevalent for so many years :

Coal naturally absorbs oxygen from the air and undergoes a process of slow combustion. As this process goes on heat is developed, and the temperature of the coal tends to rise. The activity with which the oxygen is absorbed increases as the temperature rises. It appears, therefore, that the conditions necessary for the spontaneous heating of coal are: 1, A sufficient supply of oxygen ; 2, prevention of the escape of the heat generated. These two conditions are more or less incompatible. Whether the coal heats or not depends on whether the heat can or cannot escape as fast as it is generated. Since heat passes away more rapidly (other things being equal) the hotter the coal, while the supply of air for promoting combustion is conditioned by other circumstances, it often happens that the temperature of a heap of coal will rise to a certain point, which it will not pass. If a heap of coal is prevented from coming in contact with air, no action will occur and no heat will be developed. On the other hand, if the air supply be so free as to carry away the heat generated at a sufficient rate, again no heating will take place. In order that spontaneous combustion may occur, the supply of air must be nicely regulated. The kind of ventilation which used formerly to be employed with coal cargoes often supplied just the air necessary for spontaneous heating. At low temperatures the absorption of oxyen by coal is a comparatively slow process, and at a given temperature the rate of absorption depends on the ratio of the surface of the coal to its volume. Thus, other things being equal, the smaller the coal the more rapidly will it absorb oxyen. On the other hand, the coal cannot absorb oxyen unless the oxygen is there to be absorbed, and when the coal is in very fine dust the rate at which the air can penetrate the heap is only small. It therefore appears that when the coal is in large pieces it will only absorb oxygen slowly, because of the comparatively restricted area of surface which it exposes ; while if the coal is in very fine powder the air will not be able to penetrate the mass with sufficient freedom. There must, therefore, be a certain size of coal at which the rate of absorption will be a maximum. Such an effect was observed by Fayol, who shows that heaps of small coal mixed with coal dust offer the most favorable conditions for heating. Such heaps are formed under the hatchways of ships which are loaded by dropping the coal from hoppers, spouts or wagons, so that the coal gets broken up during the process. The size of a heap of coal has a great influence on its liability to spontaneous combustion. Thus, Fayol found that the coal of Commentry never took fire by exposure to air when the heaps were less than 2 m. deep, no matter what the lateral dimensions of the heaps might be. It was formerly supposed that the oxidation of pyrites is the initial cause of spontaneous heating. This, however, has been disproved in many test cases by direct experiment, and it also appears that there is no direct relation between the pyrites content of coal and its liability to spontaneous combustion. On the other hand, if coal is wet it has been shown that the pyrites tends to oxidize, and in so doing may help to break up the coal and so render it more liable to spontaneous combustion by increasing the surface. We are now in a position to understand the main features of the phenomena of the spontaneous combustion of coal. Coal always absorbs oxygen from the air, and always generates heat in consequence of the combination of the oxygen with the carbonaceous contents of the coal. The rise of temperature, however, which accompanies this process is dependent on the rate at which oxygen is absorbed, on the one hand, and on the rate at which heat escapes, on the other. Both of these factors may be greatly influenced by comparatively trifling variations in the conditions. The size of the coal, the distribution of coal dust, the initial temperature of the coal, the temperature of the inclosure in which the coal is placed, the size of the heap of coal—all have an effect on the temperature attained. To any one approaching the subject for the first time, the great puzzle is to understand why some cargoes fire and why others escape—all being under conditions which are to the first order identical. After study of the phenomena, however, it easily appears that there must necessarily be a kind of critical temperature. If the coal succeeds in reaching this, then its thermal equilibrium becomes unstable and the temperature rises indefinitely. A very slight difference in the conditions will determine whether this critical temperature, which itself depends on the special circumstances, is attained or not. The puzzle above referred to is, therefore, solved by the remark that when some cargoes fire and others do not, the conditions are not the same in reality, though, roughly speaking, they may appear to be so. The apparently erratic behavior of coal cargoes is therefore just what would be expected, having in view the fact that very slight variations in the circumstances may make all the difference in determining whether the critical temperature will be passed or not.

Points on Core Making.

The Holland Linseed Oil Company, 683 Austin avenue, Chicago, are making a special core oil for foundrymen's use, with which remarkable results are obtained. The accompanying cut shows a very difficult core—namely, a port core for a steam cylinder—made with this oil without venting. The core maker who turned out this core states that none of the small sized cores made with this oil are



Points on Core Making.

vented, but the large ones generally are. The saving of time in making small cores without venting is very considerable and in itself is a strong point, but it is further claimed that still more time can be saved in making cores with the core oil than with flour. These cores are not liable to blow, and are therefore much safer. The company claim that if the right kind of sand is used with their core oil there is no need of ever losing a casting. If there is no combustible matter in the sand, the little that the oil contains escapes in baking. With open sand the core is very porous, and is consequently a magazine for storing gas. After the casting cools these cores crumble very easily, and thus finally save time in their removal.

A committee of the Merchants' Exchange of St. Louis, Mo., are completing plans for the establishment of the proposed line of steel barges between that city and New Orleans, La. It has been found that at least $250,000 will be needed to equip and operate the proposed barge line, and a meeting has been called to initiate active steps toward raising the money and incorporating a company for the purpose. It is thought that the proposed line of steel barges will secure a better outlet for the export products of the St. Louis market than at present exists, and enable that city to meet the competition of other trade centers on more favorable terms.

TIN PLATES.

Industries at New Castle, Pa.

A correspondent of the Pittsburgh *Times*, who recently visited New Castle, Pa., speaks of a number of the larger industries of that place as follows :

New Castle expects to be able to produce one-fifth of the total amount of tin plate now consumed in the United States. And yet New Castle has now the largest tin plate establishment in this country, possibly the largest in the world. This is operated by the New Castle Steel & Tin Plate Company, has 20 hot mills and 21 cold mills, turns out daily 150 tons of finished black and tin plates, employs about 1500 men, boys and girls and has a monthly pay roll running from $58,000 to $60,000.

The new tin plate mill, which is located just across the Shenango River from the present establishment, 40 acres of land having been secured for its site, will have 30 hot mills and 28 cold mills, with a probable capacity of 300 tons per day. It will furnish employment to about 2000 people. This isn't "boom." It is business. When the project was started it took but from 11 o'clock in the forenoon until 6 in the evening to get $500,000 in cash subscriptions to the stock. The money is ready, the contracts let for the work, and it is already going on.

The Shenango Valley Steel Company are the parent corporation of both tin plate companies. Their president is W. E. Reis, their vice-president, William Patterson. The stockholders of the New Castle Steel & Tin Plate Company were largely stockholders in the other corporations. When the tin plate works were started, Phelps, Dodge & Co. of New York, the largest importers of tin plate in the country, began buying from and selling for them. Later the firm bought stock in the concern. When the new tin plate organization was formed the principal movers in the matter were also stockholders in the Shenango Valley Steel Company and the New Castle Steel & Tin Plate Company. Lately it has been deemed best to consolidate all three, and this consolidation goes into effect on July 1, 1898. The stock of the consolidated organizations will be $2,500,000. Phelps, Dodge & Co. have largely increased their holdings of stock.

The Shenango Valley Steel Company's mill has a rolling capacity of about 1000 tons per day. They are now building a bar mill to make tin plate bars 16 inches wide. This size may be increased to 20 inches. These additions will nearly double the capacity of the establishment, and will be completed by February 1. They now own the Red Jacket furnace and control the Norway furnace. In addition two new blast furnaces are contemplated. The monthly pay roll is now about $50,000. With the completion of the new tin mill and the addition to the steel mill, it may run up to $150,000 a month. When the iron ore goes into the flaming mouths of the furnaces its process of development, in practically one establishment, ends in steel and tin plate, and, through allied concerns, wire rods and wire nails.

There is also another tin plate plant in process of construction. The Arethusa Iron Works, a six-mill sheet plant, are being converted into a tin plate mill. The new organization is the Neshannock Sheet & Tin Plate Company, with George W. Johnson at their head. They will have six hot mills and six cold mills, the latter driven tandem. The foundations for the tinning department are being laid, and it is expected that the establishment will be in running order by January 1. The anticipated daily output is 50 tons of tin plate, and the mill will furnish employment to 250 or 300 people.

Getting away from tin plate—that bone of contention between political parties in late years—the New Castle Wire Nail Company claim attention. This company have a rod mill which makes the rods their nail factory turns into wire nails. It has a capacity of about 125,000 kegs per month or 70,000 gross tons per year. It employs about 700 men and its monthly pay roll aggregates about $30,000. Its product is shippied from Portland, Maine, to Portland, Ore., and even to South America and Japan.

The Rosena Furnace, one of the largest in the world, owned by the Oliver & Snyder Steel Company, is in operation. It has a remarkable capacity and furnishes employment to a great many men. The Norway Iron & Steel Company's furnace, with a capacity of 250 tons per day, is also running. The Atlantic Rolling Mill, one of the oldest in the country, has been, through business troubles, idle and in the hands of a receiver for some time past. The receiver has just been relieved of his duties, a reorganization effected and the big establishment is likely to be soon in full operation.

SCRAP.

The stock of foreign Tin Plates in bond at the port of New York at the present time is lower than ever known before. The amount reported on October 1 in the official monthly statement of dutiable goods in bonded warehouses was 1,826,742 pounds, valued at $42,070, as against 4,038,922 pounds, valued at $77,318, on the corresponding date of last year

The Port Talbot Tin Plate Works, Port Talbot, Wales, were recently put up for sale at auction. As only one bid, of $25,000, was made, the property was withdrawn.

The two new mills contracted for by the Pennsylvania Tin Plate Company, New Kensington, Pa., will probably be in operation by January 1 next. This will give the concern a complete modern six-mill plant, with a capacity of about 24,000 boxes a month.

The Leechburg Foundry & Machine Company, Pittsburgh, Pa., have booked an order for a three-high modern Bar and Skelp Mill for the La Belle Iron Works, Wheeling, W. Va.

The United States Tin Plate Mfg. Company, Demmler, Pa., have placed an order with the Totten & Hogg Iron & Steel Foundry Company, Pittsburgh, Pa., to equip their mill with Freeman's Patent Furnace Charger for charging their annealing furnaces. They have also ordered a Mesta Patent Pickling Machine from the Leechburg Foundry & Machine Company of Pittsburgh.

The Ferguson Tin Plate Company, who operate a dipping plant at East Liberty, Pittsburgh, have been looking about for some time with a view of removing their plant and rebuilding on a much larger scale. It is the intention of the concern in the event of rebuilding to erect a much larger plant, and also build a three and four mill plant for the manufacture of Black Plate. Negotiations are now in progress with parties at Uniontown, Pa., and it is possible the plant will be removed to that place. It is understood that the concern have secured a large tract of land adjoining Uniontown and will build a new town if the citizens will buy $125,000 worth of lots, the proceeds to be held by Uniontown banks and applied to payment for the new plant.

Wm. J. A. Bolles, brother of C. H. Bolles, Jr., the New York representative of Merchant & Co , Inc., was married Wedesday evening, November 10, to Miss Willmarth of Brooklyn. Mr. Bolles has been connected for several years with Merchant & Co., acting as salesman among the Brooklyn trade, where he is well known, and he has also had charge of their Brooklyn warehouse at 584 Flushing avenue. He and his wife made a wedding trip to Washington and other points in the South.

George Shaw of Bellevernon, Pa., chief engineer of the National Tin Plate Company, was among those who were recently proposed for membership in the American Society of Mechanical Engineers.

The Wais & Roos Punch & Shear Company, Cincinnati, Ohio, report the number of inquiries for their productions very much on the increase within the last 30 days. The company have in course of construction a large number of Special Rolling and Tin Plate mill machines for such firms as Carnegie Steel Company, Pittsburgh ; Ætna-Standard Steel & Iron Company, Bridgeport, Ohio ; Reading Iron Company, Reading, Pa. ; Laughlin Nail Company, Martin's Ferry, Ohio ; Johnstown Tin Plate Company, Johnstown, Pa., and Midland Iron & Steel Company, Muncie, Ind.

The export of Tin from Tasmania in the first six months of 1897 amounted to 1143 tons, as against 2700 tons for the entire year 1896. The falling off in output this year was in the alluvial Tin Ore districts and was due to scarcity of water. The output of the great Mount Bischoff mine was well maintained. The company who own the mine continue to pay regular monthly dividends and since it started up to June 30, 1897, $6,988,800 of profits had been distributed.

A local paper states that the city of Port Angeles, Wash., has raised a bonus of $75,000 in cash and land for the establishment of a Tin Plate plant at that place. A company of Pittsburgh capitalists are reported as about to put up at once a Black Plate mill and Tinning plant. Coal of excellent quality is said to have been located within a few miles of Port Angeles, which is located on the Straits of Juan de Fuca, almost exactly opposite the city of Victoria, British Columbia.

THE RETAIL STORE.

James S. Hagerty.

In onr last issue brief reference was made to the death of James S. Hagerty, senior member of the well-known tinware manufacturing house of Keen & Hagerty, Baltimore, Md., after a comparatively short illness, from a complication of diseases. The following particulars have been obtained regarding the career of this prominent member of the tinware trade: James Summerfield Hagerty was a son of the late James Hagerty of Baltimore, and was born in that city 68 years ago. When quite a young man he established, with the late George V. Keen, the firm of Keen & Hagerty. For years the office, salesrooms and factory were all located at Calvert, Water, Grant and Hollingsworth streets. During the present year salesrooms were established on West Baltimore street, near Charles, and an additional factory erected in South Baltimore, bordering on the tracks of the Baltimore & Ohio Railroad. The firm now employ 600 hands and have a dozen traveling salesmen. Several years ago James R. Hagerty, George V. Hagerty and Summerfield Hagerty, sons of Mr. Hagerty, with C. L. Wagandt, were taken into the firm. Mr. Hagerty was very active in all matters pertaining to the benefit of his native city, and was specially prominent in the movement for providing adequate street transport facilities. He was one of the originators of the Baltimore Citizens' Railway in 1870, and was its first and only president. When it was merged in the other city railways he was elected a director of the Consolidated Company. For 25 years Mr. Hagerty was snperintendent of Grace Methodist Episcopal Sunday school, and of recent years was recording steward of the church. He was also a director of the Third National Bank of Baltimore. A widow and four sons survive him. The latter are James R., George V., Summerfield and Oliver P. Hagerty.

Changes in New York Hardware District.

A public notice recently given by the Department of Public Works of New York City, under authority of the State law of March 17, 1897, to all owners and occupants of the buildings on the site bounded by Chambers, Centre and Reade streets, up to the building of the American News Company, to vacate their premises on or before November 26, will involve a number of changes of location on the part of important hardware houses in the Chambers street district lying east of Broadway. The buildings are to be sold at public anction, and after demolition will make way for a Public Record Building, to be erected on the site. Among the concerns which will be obliged to move are Peck, Stow & Wilcox Company, U. T. Hungerford, Stanley Rule & Level Company and Sargent & Co.

Of these houses, Peck, Stow & Wilcox Company, now at 27 Chambers street, have leased the premises lately occupied by the Atlas Tack Corporation, at 31 Warren street and 27 Murray street. They have the street floor and two basements running through from Warren to Murray street. A force of workmen are rearranging and remodeling the floors, and the company expect to move in the near future.

U. T. Hungerford, 29 Chambers street, New York, has leased the entire building, 121 Worth street, and will occupy the premises as soon as they can be renovated and refitted. The building has six stories and a cellar, each 80 x 22 feet, and is very convenient to the brass district. The street floor will be used as a shipping department, with offices one flight up. The remaining floors will be used to store stock. Mr. Hungerford will continue to carry a large stock of sheet copper and brass, seamless brass and copper tubing, brass rods, brass and copper wire, brazed brass tubes for gas fixture work, soldering coppers and a general line of brass and copper goods.

Stanley Rule & Level Company, 29 Chambers street, have leased an entire floor in the Cary Building, 107 Chambers street. They have the first floor above the street, directly over the Union Nut & Bolt Company. The floor extends clear through to Reade street, and is 150 feet long by 25 feet wide. The company expect to be moved before December 1, and in their new home will have greatly improved facilities and more commodious accommodations.

Sargent & Co., partly owing to the large space required and the short notice given, have decided to avail themselves of a fine modern buiding at 149, 151 and 153 Leonard street, about 100 feet east of Centre street. This structure, built within the last five years, occupies a site 115 feet deep, with a frontage of 70 feet. They will occupy the entire building, in all seven floors and one basement. Alterations are being pnshed forward, and they expect to occupy the building by December 1, or not later than the first of the year.

A Hustling Salesman.

The following item is taken from a recent issue of the Troy *Record*, and may prove interesting reading to dealers: A well-known uptown hardware dealer has in his employ a brother who is a hustling salesman. A few days ago a customer came in the store and made a purchase of some hardware, and after paying for it began to inspect the stock of stoves on hand. He was intently gazing on a parlor stove of beautiful design, when the hustling clerk came forward and said: "That's a nice stove." The customer agreed with him and the clerk proceeded to induce him to buy one by asking him how he would like to have one like it. The customer said he was well supplied at present, and in reply to a question of the clerk, said he used an Atlas. "An Atlas," repeated the clerk; "why, my dear man, you should have an Andes in your honse. They are the greatest fuel savers in the world." Taking his derby off his head, he continued: "You could put a block of wood in that stove the size of this hat and you would get all the heat you wanted out of it for 36 hours, and the next day you could take it out and sell it for charcoal." The customer took one look at the clerk, picked up his bundle, and made a double quick exit from the store.

Agate Nickel-Steel Ware.

Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, have brought out what they term Agate-Nickel Steel Ware. Originally they used a fibrous iron made by the charcoal process, which was coated with a gray enamel mottled by oxidizing the surface of the metal. The revolution that has taken place in late years in the production of steel, both by the Bessemer and Siemens Martin processes, has led manufacturers to seek a method of applying enamel on steel, instead of Iron, on account of the reduced cost of Steel. The usual process, however, applied to fibrous Iron could not successfully be applied to Steel or to other homogeneons metallic surfaces on account of the density and closeness of the metal. The resulting difficulties manifested themselves in the form of pin holes, scales and the readiness with which the enamel chipped and flaked off the metal, thus destroying the finish, beauty and durability of the article. In enameling the addition of arsenic, lead or antimony to the glaze is said to give an adhesion that it lacks without these ingredients. The use, however, of such elements may under certain conditions be detrimental to health, especially if through oversight, inexperience or carelessness they are not properly mixed.

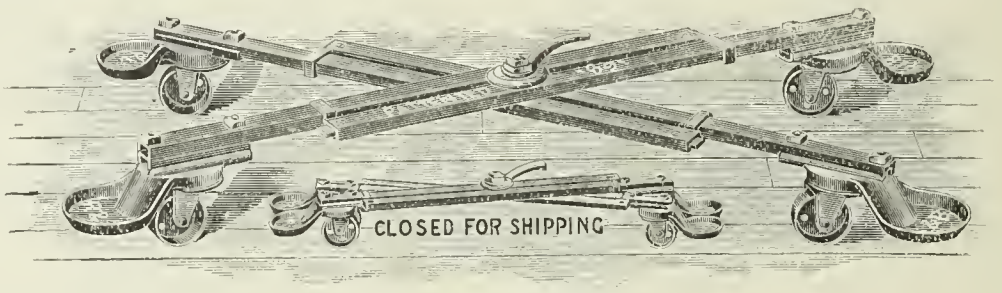
To take advantage of the lower cost of steel and yet successfuly coat it, has led the Lalance & Grosjean Mfg. Company to make a series of experiments, which within the year have resulted in their placing upon the market their Agate Nickel Steel Ware. The invention which is controlled by them consists of an interposition of a binding film of magnetic metal, such as nickel, between the steel body and the enamel, thus enabling them to use steel for the body of the article without the necessity for employing any of the objectionable ingredients referred to. The effect of this binding film or intervening coating on the steel surface which is not capable of retaining a direct coat of enamel without it, they say, is that this intervening film enters into such a firm combination with the steel as not to be separable therefrom. In turn the enamel or glaze likewise has such a chemical affinity for the nickel deposit as to cling to it tenaciously. In other words this intervening metallic coating forms a bond that ties or binds the enamel to the steel, while without such a bond the proper enamel will not adhere.

This metallic coating is preferably applied by them by electro deposition. The electric current drives the nickel into the steel, producing substantially a nickel steel alloy, they state, of great strength, care being taken not to have the metallic coating of sufficient thickness to prevent the enamel or glaze from being mottled by oxidation of the foundation metal, the mottling being an essential feature,

giving color and finish to the article. To more clearly demonstrate this the company partially nickeled a steel dripping pan, leaving more than a third of it in its natural state. Then the entire pan was enameled. As a result that portion without the intervening coat of nickel shows where the enamel has separated from the steel. While, as stated, the same result is in a measure obtainable by the use of the ingredients mentioned, we are advised by the company they are entirely absent in the goods made under this process. In manufacturing this class of wares, after being stamped into shape and form the pieces are taken into the nickeling room, and the surface thoroughly cleansed, after which they receive the nickel deposit followed by a coat of enamel. After the articles are dried and burned they are then coated a second time with a hard vitreous covering capable of resisting the action of acids.

The Model Stove Truck.

The illustration presented herewith shows the Model stove truck, put on the market by the S. M. Howes Company, 40 46 Union street, Boston, Mass. It is made, as shown in the engraving, of steel channel bars with iron sockets for the stove legs at the end. The bars cross at the center and are held by a nut which can be loosened at pleasure and the spread of the truck changed to suit the dimensions of the stove. The Payson anti-friction casters, with specially designed plate, support the truck. When not in use, or when shipped, it is closed as shown in the lower part of the engraving, taking up very little room. The sockets at the end bring the stove down only an inch from the floor, so that it is exhibited in its original position. It is pointed out that the stove cannot be jarred out by running the truck over a rough floor, and furthermore, if one side of the stove is lifted the truck rises with it.



The Model Stove Truck.

In referring to the advantage gained by using trucks of this kind, the manufacturers reasonably argue that the dusty and time honored platform for stoves is an institution that should be dispensed with by the progressive dealer. The old notion that a stove upon a platform is shown unnaturally large is not a good argument for its retention, for the average buyer much prefers to see the stove in its natural position, and can judge more fairly of its suitability to his needs. A great disadvantage of the old fashioned platform, however, is the inability to change the store arrangement, and the same set style has to be maintained year after year, and apart from that the labor of arranging the stock is greatly increased, and unless the greatest care is taken the stoves are often out of alignment, and not placed in the best relative position for display. With a good stove truck these disadvantages are overcome, for the stock can be rearranged as often as is necessary, and in the meantime the store can be properly swept without an undue amount of labor.

MEMORANDA.

George Feist, an esteemed employee of Doremus & McKiernan, Stove Dealers, Main street, Paterson, N. J., died last week after a brief illness. He was 32 years of age, and leaves a widow. The funeral services were held at his late residence, 165 North Third street, on the afternoon of Tuesday, November 9, the interment being at Laurel Grove Cemetery.

W. A. McDonald announces that he has succeeded to the business of the McDonald Mfg. Company, 100 Nazareth street, Montreal, Canada, formerly conducted by his father, the late Thomas McDonald. The firm manufacture Tinware of all kinds, and make a specialty of light Sheet Iron and Copper work.

We have received from the Aluminum Mfg. Company, Two Rivers, Wis., Jos. Koenig, manager, a sample of an elegant Button Hole Bouquet Holder, which they are now manufacturing. The Holder, they inform us, is drawn out of one flat disk of aluminum the size of a half dollar. As it forms an oval tube 2¾ inches in length by ⅜ inch wide the article shows a superior piece of mechanical art. The hook for fastening the holder in the button hole takes the form of a small fern leaf.

In preparation for the winter and spring trade the Youngstown Specialty Mf'g. Company, Youngstown, Ohio, have issued a little pamphlet relating to maple sugar supplies. These include Sap Spouts, Can Trimmings, Syrup Cans, round and square ; Sap Pails, tin and galvanized iron ; Sap Pail Covers, &c. All these goods are illustrated, particulars are given where necessary and price-lists of different sizes.

Henry H. Tousley, Saranac Lake, N. Y., is building a new store, which he expects to have ready for business by March 1 next. Mr. Tousley will carry a full stock of Shelf and Heavy Hardware, Stoves, Sporting Goods, &c. He advises us that he would be pleased to receive catalogues and price-lists from manufacturers and jobbers.

Hoff & Bro., wholesale and retail Hardware, House Furnishing Goods, &c., Reading, Pa., have lately completed a two-story brick annex to their store. The firm refer to business as very much improved.

A. J. Aldrich will shortly open a new Hardware store at Elkton, Mich. Mr. Aldrich's stock will comprise Shelf and Heavy Hardware, Agricultural Implements, Tinware, Stoves, Sporting Goods, &c.

H. L. Cook & Co., a new firm, are opening up in the retail business at Aberdeen, Wash. They are carrying a line of Shelf and Heavy Hardware, Stoves, Tinware, Implements, Sporting Goods, &c. They are also manufacturers of artificial ice.

D. C. Huskins of Sloan, Iowa, and Hiram S. Gordon of Macon, Mo., have formed a partnership in the Hardware business at Sloan, Iowa, under the style of D. C. Huskins & Co. They are carrying a stock of Shelf Hardware, Stoves, Tinware, Glassware, Wagons, &c.

E. C. Spencer has opened a new stock of Hardware in Gebo, Mont. Mr. Spencer is retailing Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, &c.

J. L. Weaver, dealer in Shelf and Heavy Hardware, Tinware, Stoves, Implements, &c., Parker, S. Dak., has sold out to Harper, Jones & Co.

Lyman & Clawson, Pittwood, Ill., have opened a new Hardware store, handling both Shelf and Heavy Hardware, Tinware, Stoves, Agricultural Implements, Sporting and Athletic Goods, &c.

C. H. Resimins is about opening up in the Hardware business at Rib Lake, Wis. He is occupying a new building, 26 x 70 feet, and will carry a full line of Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c. A Tin shop will also be conducted.

The Sidney Hollow Ware Company, Sidney, Ohio, inform us that there is to be no change whatever in the style of their name and the management continues as heretofore. This announcement is made on account of recent publications regarding the sale of the plant.

Geo. William Hoffman, Indianapolis, Ind., manufacturing the United States Metal Polish, issues specially prepared printed matter relating to the merits of the Metal Polish, also giving the locations of principal repositories throughout the United States, and is distributing thousands of unique samples of the polish itself, which he will be glad to forward to any one addressing him upon the subject.

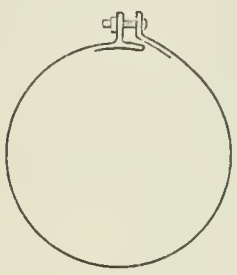
Stark & Tesch, retail Stove and Hardware dealers, doing business at the corner of Appleton and Edward streets, Appleton, Wis., favor us with a large poster, illustrating some of the goods in the cooking and heating line which they handle. Prominent among these may be mentioned the Stewart Base Burner, the Stewart Oak, the Stewart Range and the Stewart Hot Blast, the latter being referred to as something new and as burning wood lying flat instead of necessitating its being set on end. The firm also handle the well-known Garland line of Stoves, the Dangler Gasoline Fire Place, the Ideal Oil Heater and the Robinson Tubular Furnace.

STOVE TRADE NOTES.

A CHANGED COLD AIR INLET.

BY S. A. M.

The writer recently had occasion to clean a furnace that had been in use for many years. On taking down the hot air pipes there was found in them a collection of dirt and lint that, when the air was heated, would evidently give rise to a good sized "hurnt air" theory. After the



A Changed Cold Air Inlet.—Fig. 1.—*Slip Joint Made from One Piece of Iron.*

pipes had been cleaned attention was paid to the furnace itself. It was found to be thickly covered with dust and, as a remedy, was taken apart and washed. As the water pan was set in the front over the ash door this part of the fire pot was found to be badly burned and warped. In

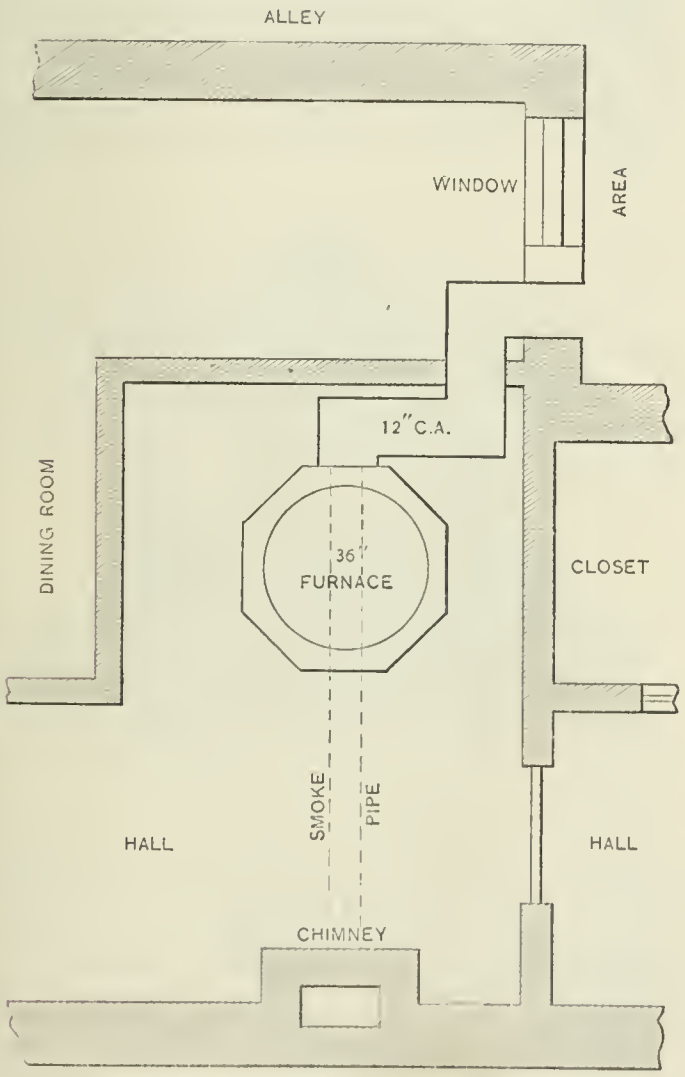


Fig. 2.—*Plan of Basement, Showing Location of Furnace and Cold Air Box*

order to save the expense of a new fire pot it was made to "'bout face." As the furnace was a portable one with a cast iron front this warping of the fire pot had raised the front from the cast iron base, thus leaving space for air to enter the fire. After cementing the joints and placing the radiator in position it was discovered the warping of the fire pot was enough to lengthen it about 1 inch, thus making the dust flue too short. To remedy this difficulty a piece of iron was bent as shown in Fig. 1, which makes a very satisfactory bandage to use when it is not convenient to lengthen the pipe by putting on another piece. By putting stove putty on the collar and pipe, then over the band, a smoke tight joint was secured by means of a stove bolt.

In Fig. 2 is shown a plan of the furnace and cold air inlet. It will be seen from an inspection of the plan that the furnace is situated, as are many furnaces in city residences, in a recess left for the purpose. The cold air inlet was round and 12 inches in diameter. A square box was set in the wall, and from this the pipe extended through the partition and then down to another box which was

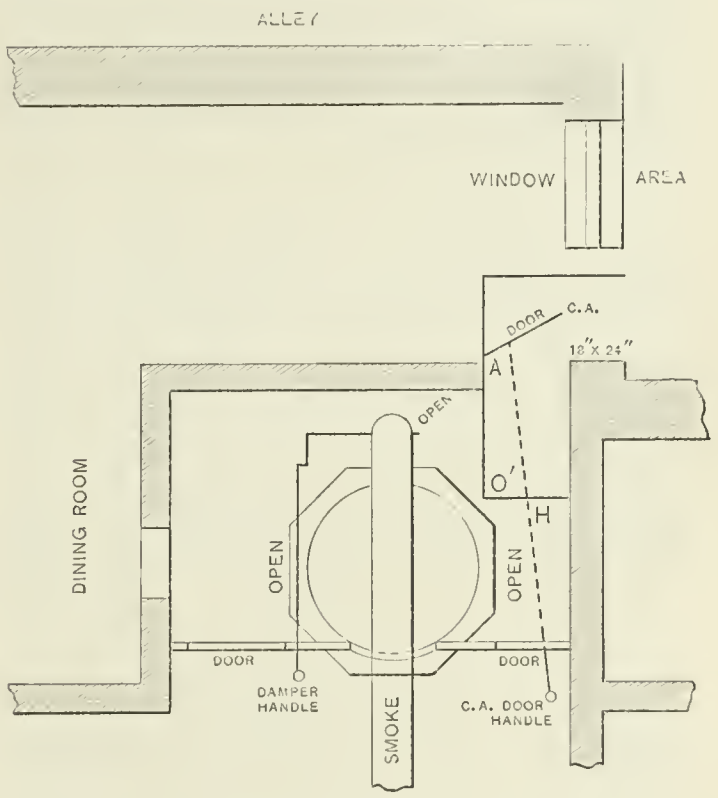

Fig. 3.—*Plan Showing Change in Cold Air Inlet.*

connected with the base of the furnace. There are connected with the furnace one 7-inch, three 8 inch and three 9-inch heating pipes, giving a total of 382 square inches. Deducting one-fourth, the result would be 287 square inches as the required area of the cold air inlet. As the area of a 12-inch pipe is 113 square inches, it will be seen that the round pipe was not one-half of the required size. The previous winter the parties occupying the house had burned a large amount of coal and had received only a small amount of heat in the rooms above. About the only place in the house that would be warm was the basement hall. As the cold air inlet passed down by the smoke pipe, and the heat radiated from this pipe and from the furnace would heat the inlet pipe, the air would be warmed and thus destroy the draft. Another defect was the small opening into the base of the furnace, it being only 6 x 17 inches, which is less than the area of the 12-inch inlet. When it is taken into consideration that the cold air inlet should have an area of 287 inches, and the opening into the furnace had only 102 inches, we can plainly see why the furnace refused to operate with such a small supply of cold air. Not only this, but there was

no provision made by which the cold air from the house or basement could be taken through the furnace during the night or when the house was cold.

The result of this defect was shown in the galvanized iron casing, for the zinc coating was burned off from both the upper and lower sections of the casing. When the lower casing is burned it is an indication that there is a deficiency in the cold air supply. To remedy the difficulty it was decided to enlarge the cold air inlet. Accordingly, the old pipe was taken out and an opening made in the outer wall extending from the window frame to the wall and as high as circumstances would permit. The size of the opening was 18 x 24 inches, giving an area of 432 inches. A similar opening was made in the partition separating the dining room from the furnace. A wooden box was made in the dining room by nailing strips of wood to the ceiling, wall and partition, then boarding the two sides and bottom. Two sides of the octagon base of the furnace were taken out, thus giving three openings having a combined area of 216 inches, which was all that could be given on acccount of the peculiar construction of the furnace.

It was then decided to depart from the usual custom in the construction of cold air inlets and make an air chamber of the recess. Accordingly the space between top of furnace and side walls was covered with iron, and the space between partitions and cast iron front treated in a similar manner. Pieces of wood were run from the floor to the iron roof and two wooden doors hung, as shown in Fig. 3. The cold air inlet was continued down to within about 1 foot of the floor, thus giving the air every opportunity to circulate about the base and enter the three openings. These two doors were provided so one could enter the cold air chamber at any time, and for another reason, which will appear further on. A door was hung in the cold air inlet at A and a rod connected with it, so the door could be opened or closed as desired. Marks were made on the wall so the position of the end of the rod would indicate whether the door was open full, closed, or partly closed. At night the cold air door is closed and one of the doors opened into the air chamber, so the air in the house can circulate through the furnace. That the smoke pipe damper could be operated conveniently a crank and rod were connected with the damper, the rod extending through the front. In order that the heat collected in the air space should be utilized an opening, shown in Fig. 3, was made in the partition, thus allowing the heated air from the furnace casing and smoke pipe to enter the dining room. As there was more heat derived from the top of furnace casing, heating pipes and smoke pipe than was desired in the hall, the elbow connecting the furnace with the pipe leading to the bathroom was taken out and a tee placed in its stead, a damper being placed in the branch near the furnace and the open end, so the heat from above the furnace could be directed into the bathroom, or this damper could be closed and the other opened, thus allowing the air from the furnace to go to the room.

As a result of this change in the cold air inlet the various registers give out a great volume of heat and the basement hall is no longer the warmest room in the house. It was not considered necessary to show the various heating pipes in Figs. 2 and 3.

PROFITABLE PRICES

In a recent conversation one furnaceman who did a large business inquired of another furnaceman whose business was by no means so large in the number of furnaces sold, how it was that he could afford to do the character of work he did. He replied that he got the right price. In return the former said that he could not get the price, and in explanation the higher priced man stated jokingly : "It is because your trade do not have confi dence in you on account of your low prices. They know that real, first-class work cannot be done at the price which you offer. It is customary for the buyer to always haggle over a price and secure a reduction if he can, and I have quite a bit of trouble to secure the prices which I ask. I make it a point, however, to talk quality on the principle that if the work did not suit the man the price wouldn't suit, whatever it might be. After you have thoroughly impressed him with the fact that you know how to do good work, and will do good work, you can make the price as much lower as you like, but the inducements which are presented in the low price will not fetch him. There is another thing which I consider very foolish in you. You sell a large number of furnaces and are not satisfied with the price, and naturally the profit derived is less than you would desire. You, however, have supplied the market—in other words, killed the goose which is to lay you your golden eggs. You have neither made a profit nor have you raised the standard of work or price, and you must hunt on the same line of argument for your customers, who will exact the same price. Not being accustomed to spend the time in educating your buyer, nor ready with the information that must be given him to make him pay a higher price, you continually get deeper into the mire of furnishing the supply without receiving the profit. On the other hand, I don't sell so many furnaces. I put in a good deal of time on education, and when I do sell there is a balance in my favor that you seem to be deprived of. I would suggest that you change your methods ; talk quality instead of price ; sell quality instead of quantity, and make profit on the small sale."

CHICAGO HEATING TRADE PROSPECTS.

An extended inquiry among the Chicago manufacturers and dealers in heating appliances shows a general abatement in the demand. Hot water heaters and steam boilers are not nearly so active as three or four weeks since, when all houses were enjoying a fairly active trade. New work is being finished with the close of the ordinary building season, and not much is offering in the line of repair work or reconstruction of heating plants in old buildings. The warm air furnace trade is holding up somewhat better, probably because a larger proportion of the business done in this branch is in replacing worn out furnaces with new constructions. All of the furnace houses, however, are not equally busy, some of them having found the demand quite moderate during what might be termed the rush season.

Substantial unanimity is found respecting prospects for future business. Much figuring is going on with architects, contractors and owners, presaging activity in the building trades in the coming year. Arrangements are being made in numerous instances for undertaking work very early in the spring, so as to push construction to completion about the time of the renting season. Operations in the building line have been so quiet in Chicago for the past three years that the prospects of a great increase in activity are hailed with much pleasure.

The Active Acorn Range.

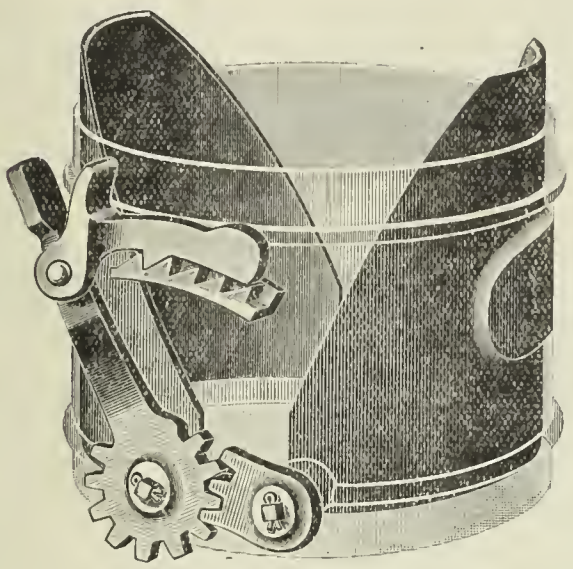
Rathbone, Sard & Co., Chicago, have issued a remarkably handsome catalogue of their Active Acorn steel oven ranges. This catalogue does not comprise many pages, numbering only eight, but in point of attractive features it outclasses many publications vastly more pretentious. The pages are 9½ x 12 inches, affording wide margins for the reading matter. The four central pages present superb views of the ranges in as many different styles. A blue paper cover incloses the contents, and on the cover is a daintily embossed title. The paper used is of heavy weight and highly calendered. Those who receive this document are not likely to throw it aside without examination, while it is more than probable that it will be preserved for future reference. The Active Acorn has proved the best selling range put on the market by this company. It is made to resemble in appearance the usual high class steel range, but it has cast iron outer walls 50 per cent. thicker than ordinary stove plate, and is therefore claimed to be much more durable than ranges made with sheet steel walls. The oven is held in place by bolts instead of rivets, as in steel range construction, which enables a new oven to be quickly put in place should one be required.

E. B. Colby & Co., Beekman and Pearl streets, New York, are making a fine display of Favorite and Cable Stoves and Ranges that should be of interest to the Stove dealer visiting New York City. In addition to

handsome Parlor Heaters with elaborate nickel trimmings and ample mica illumination they have a line of Surface Burning Cylinder Stoves. The Favorite and Cable Ranges also present a wide variety for selection, and are capable of meeting the requirements of any class of trade.

The Household Damper.

The trade will be interested in the accompanying illustrations of the Household damper, made by the White-Warner Company, Taunton, Mass., which possesses several novel and interesting features. Fig. 1 shows the damper open and Fig. 2 shows it closed. The first point to which the manufacturers direct attention is that it is



The Household Damper.—Fig. 1.—Damper Open.

eminently durable, all the working parts being extra heavy and the damper being entirely of cast iron, so that it will not rust out or break apart through corrosion. The construction is so clearly indicated in the illustrations that a description is hardly necessary. It will be seen, however, to consist of two sections which come together in a conical form, the apex being cut away so as to give a small aperture for the passage of gas. When the damper is open, as in Fig. 1, the curved shields are thrown back so as not to reduce appreciably the area of the pipe. At the back of each shield is a sort of raised

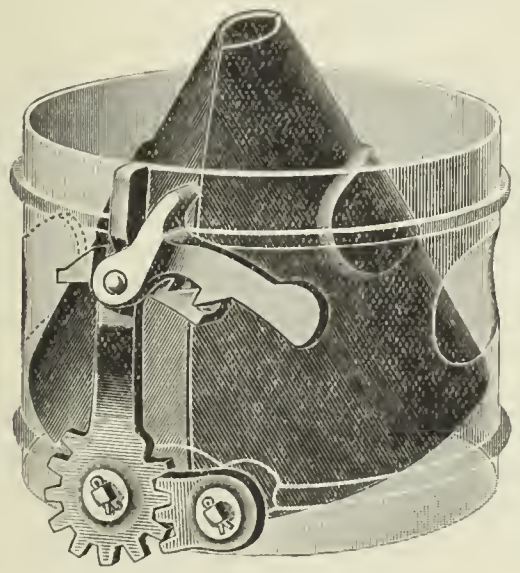


Fig 2.—Damper Closed.

panel which fits into holes in the pipe and closes them. When the damper is closed, as in Fig. 2, the area of the smoke pipe is practically shut off and at the same time two openings are uncovered in the sides of the pipe which permit the air to enter the chimney and further check the draft. The mechanism by which the damper is operated is simple and effective, and it has the advantage of positively holding the damper in any place, as the pawl and ratchet give a positive stop. The dampers are made for 6, 7 or 8 inch pipes. They are useful for steam and hot water boilers and hot air furnaces, or wherever it is desired to control the draft of a smoke pipe.

W. J. Anderson, president of the Richmond Stove Company of Richmond, Va., was married on November 10 to Mrs. George L. Cottrell.

Walker's Home Crawford Range.

Walker's Home Crawford is the name of a new range brought out by the Walker & Pratt Mfg. Company, Boston, Mass., and illustrated in a four-page circular which is now being distributed to the trade. This firm have in the past been conspicuous for the care which they have devoted to the design and construction of their goods, and this latest addition to their extensive line more than sustains their reputation for ingenuity, designing and carefulness. The first point made is that the oven is square and of the same size at the top and bottom, the oven opening in the No. 8-20 size measuring full 20 inches in the clear width, both top and bottom. The front oven plate is vertical, without the usual offset, and the oven rack may be placed at five different hights. A particular feature to which the makers allude is the system of controlling drafts, they having devised a single one-piece sliding damper for this range, thus avoiding all confusion from a multiplicity of dampers. The damper has three locations, one for kindling, one for baking, and one for checking the fire when the oven is not in use. No two dampers in this case can be set so as to interfere or counteract another, for with the single damper in kindling it is moved to the extreme right, in baking to the extreme left, and for checking the knob is placed in the middle position, each of these locations being plainly marked by letters cast on the top of the range. Not only is this system the perfection of simplicity, but the damper itself is simple and can be instantly removed without tools by unscrewing the nickel knob which moves it. Great care has been taken in the construction of this damper to make it tight, this being accomplished in two ways: 1, By inclining the damper so that by its own weight it fits closely the plate on which it slides; and 2, by planing accurately both the damper and the seat on which it rests. These planed surfaces make the damper slide smoothly and straight and give a close fit, while having it inclined makes it independent of wear, for the longer it wears the tighter it should become. Precautions are taken against waste of heat by making the upper flue strip with cup joints at the top and bottom, thus providing double self packing joints. With this range three styles of grate can be furnished, a plain one-piece flat grate, a triple shaking grate and an improved dock-ash grate, the latter being recommended because of the new and simple way in which the gears are attached, enabling either bar to be taken out readily or replaced. The range is provided with an exceptionally large ash pan, has triple oven back, composed of two cast iron plates with asbestos filling and removable top oven plate, which can be taken out without disturbing the top of the range. The manufacturers have given much attention to the design, and have avoided, as far as possible, straight edges to the top of hearths and shelves, curving all possible edges so as to remove the box like appearance and stiffness, due to bounding a range by right lines. All the edges are finished by convex steel rails nickel plated over copper. The Crawford heat indicator is furnished with every range.

Stove Plates Cast at Durham Furnace.

At a recent meeting of the Numismatic and Antiquarian Society in Philadelphia, a paper was read by Charles A. Laubach of Kiegelsville, Pa., relative to early heating apparatus and to the stove plates cast at the Durham Furnace from 1741-1791. The author began by stating that iron stoves were unknown before 1678, when Prince Rupert of England attempted to convert a fire place into a furnace. This, he says, was the first attempt to force smoke back over the fire and create heat for warming apartments by the aid of iron. Early in the eighteenth century, about 1710, Count Polignac of France made an attempt to convert an ordinary fire place into a heating apparatus by simply constructing a fire place with an iron back, hearth and jambs. The result was only a slight saving of heat. In 1716 Doctor Desangliers of London succeeded in improving the Polignac fire place so that it could be used for burning coal.

The first attempt at manufacturing heating apparatus at Durham, Pa., was in 1741, by the Durham Furnace Company. The firm consisted of George Taylor (later one of the signers of the Declaration of Independence), James Logan and James Morgan, ironmasters (the latter being the father of Gen. Daniel Morgan, the hero of Cowpens).

The 1741 stove pattern was called the "Adam and Eve," from its embellishment. It was in the form of a box, 2 feet square, without side or oven doors, having merely one door in front to supply it with fuel and draft, and a hole on top to allow the escape of smoke. The stove was designed by its inventor to instruct as well as to supply comfort, having inscribed, in raised characters, the date 1741, surrounded with fine scroll work. Above this were raised figures representing Adam and Eve, the serpent, several fruit trees, and a variety of animals in the background. In 1745 Franklin invented the famous stove

which bears his name. This pattern continued to be cast at the Durham Furnace until 1774, and probably later.

In 1756, when the furnace was leased and operated by Captain Flowers and James Morgan, a new design of stove was invented by the firm and cast at the furnace. The side plates were highly embellished with scroll work and the following inscription :

"DIS. IS. DAD. YAR. DER. WELD 1756."

In 1774, when George Taylor, Samuel Williams and James Morgan were the members of the firm operating the Durham Furnace, a new model of a stove was constructed with the inscription : "Durham Furnace, 1774." This was surrounded by a wealth of fine scroll work. A portion of a stove with the above inscription and date thereon was for many years placed in a conspicuous position in front of the Easton, Pa., post office.

In 1779 Richard Backhouse became proprietor of the Durham Iron Works. During the Revolution he supplied Washington's army with shot, cannon balls, canister and grape. At the close of the war he commenced the manufacture of stills, steel wagon springs, stoves and stove pipes, in addition to pig and bar iron. In 1785 he invented an improved ten-plate stove, constructed with stove pipe attachment, as at that time stove pipe was considered a luxury. In 1789 the Valentine Eckert pattern stove was largely cast here and at the Sally Ann Furnace, near Allentown, Pa. Captain Valentine Eckert, of Revolutionary fame, had in the year 1789 a neat model of a stove constructed, which was largely cast at Durham and at the Allentown and Reading Furnace. The stove bore the inscription : "Valentine Eckert, Sally Ann Furnace," scroll work and the American eagle, carrying the motto "E Pluribus Unum" in its mouth. It is curious to note, according to the Durham Furnace ledgers, that the various stove patterns—Adam and Eve, 1741 ; Franklin, 1745 ; Philadelphia, 1755 ; Captain Flowers and Morgan, 1756 ; George Taylor, 1774 ; Mount Pleasant, 1780 ; Richard Backhouse, 1785 ; Captain Eckert, 1789, and Pettibone, 1781—were frequently exchanged among the various furnaces and forges in Pennsylvania and New Jersey and cast at designated furnaces to supply the needs and tastes of the inhabitants of the surrounding region.

ODD PLATES.

The Wolff Gas Radiator Mfg. Company, 445 Greenwich street, New York City, report a lively demand for the Wolff Gas Radiator, which, being the pioneer in this method of heating, enjoys a wide popularity. They are also introducing this year a new design of Fire Place Heater, which is said to be very effective and economical in the consumption of fuel. Circulars describing these goods can be secured on application.

George Starrett, 227-229 Water street, New York, has recently treated his building to a coat of light brown paint, against which he has painted in large and conspicuous letters signs stating that he has "Stoves for export," "Steel Ranges," "Russia Sheet Steel," "Portable and Brick Set Caldrons," "Air Tight Heaters," and that the business was established in 1844. Mr. Starrett makes a specialty of Richmond Ranges and Hot Air Furnaces, and is handling Moore's Air Tight Parlor Heater in the East.

A. L. Canfield, manager of the New York office of the Danville Stove & Mfg. Company, Danville, Pa., is showing in his salesroom, at Beekman and Pearl streets, a handsome line of Square Parlor Heaters, under the name of Beaver. A high grade Heater is called Prince Beaver and a medium priced and very attractive Square Parlor Heater is called the Ideal Heater. The Danville Oak is another of their newer attractions, and the King Beaver and Monarch Beaver Ranges have been very popular sellers and well adapted for leaders to any line of Ranges. He is showing as seasonable goods the New Monarch Gas Fires, which are of the open type with copper reflectors, needle valve for controlling supply and adjustable air mixers.

The fire which visited the works of the Kling Stove Company, Gallipolis, Ohio, on November 5, partially destroyed their molding room, but the damage resulting was principally in connection with the building. The company were obliged to stop work for about ten days, but on November 15 they made their first heat and never missed filling an order. The company have only made temporary repairs, as after January 1 they expect to enlarge their plant in order to meet the growing demands of their business. They are now running full blast as before the fire.

The Estate of P. D. Beckwith, Dowagiac, Mich., sole manufacturer of Round Oak Stoves and Furnaces, has achieved a peculiar and enviable distinction, which is well worthy of universal circulation. Michigan Labor Commissioner Fox has made a statement to which the following reference appears in a recent issue of the Dowagiac *Daily News* : "The information given out by this official was that during the year just closed the Round Oak Stove Works of this city had paid the highest wages of any manufacturing institution within the borders of Michigan. This is a high compliment to the Beckwith Estate, its management and to the city of Dowagiac, which every citizen will take pride in sharing. This announcement, coming as it does from this high official source, and going the rounds of the press of Michigan and adjoining States, will have a hearty and wholesome effect upon Dowagiac in a commercial sense, which it would well become our citizens to appreciate."

The Dighton Furnace Company of North Dighton, Mass., are meeting with a very gratifying demand for their leading specialties, and we understand that they have sufficient orders on hand to keep them running some time.

Articles of incorportion of the Thatcher Furnace Company were recorded in the County Clerk's office at New ark, N. J., on November 10, the capital stock being placed at $100,000. The incorporators are Charles O. Lyon of Milburn, Edward Benedict of Brooklyn and Lewis M. Thatcher of Franklin, N. J.

TRADE NOTES.

A charter has been applied for by the directors of the new Scottdale Rolling Mill Company of Scottdale, Pa. organized by the striking employees of the Scottdale Iron & Steel Company.

The Weir Filter Company is the title of a new concern just incorporated in New York City to manufacture Filters, with a capital stock of $100,000. The directors are Henry Aplington of New York City, Charles H. Squire of Port Richmond, Regis H. Post of Bayport, John T. Cutting and Bryce Metcalf of Rosebank.

The Alert Brass Company of Brooklyn, N. Y., have been chartered, with a capital stock of $10,000, by Minnie Steinberg and Charles Steinberg of New York City and T. C. Roberts Horsfield of Brooklyn.

Among recent incorporations of new companies in the office of the Secretary of State of Missouri was that of the St. Louis Aluminum Casting Company of St. Louis, Mo., with a capital stock of $25,000. The directors are T. E. Crecelius, G. A. Plens, O. A. Stifel and others.

The Alpha Paint & Mineral Company of Philadelphia, Pa., were recently incorporated, with a capital stock of $1,000,000, by James H. C. Barr, Frank A. Brunner and Thomas S. Johnston.

The directors of the new sheet mill recently organized at Scottdale, Pa., have elected John S. Parker president and B. F. McCann secretary.

A table compiled from the register at the rooms of the New York City Merchants' Association shows that from August 9 until the expiration of the limit of time on the reduced railroad rate tickets, 3781 merchants from 49 States and Territories and 51 merchants from outside the United States visited the rooms of the association. Nearly all these merchants were brought to New York through the efforts of the Merchants' Association. The association now has over 26,000 non-resident members and about 1200 resident members. Four series of excursions were arranged for during the early fall months, tickets being good for 30 days in each case.

Five thousand additional small arms of the new navy pattern are to be purchased by the Ordnance Bureau at Washington, in order to have on hand a reserve supply to replace rifles damaged or otherwise put out of use and to provide a sufficient number of small arms for any emergency requiring a sudden increase in the enlisted strength of the navy. Between 10,000 and 11,000 of the new arms were purchased under the original contract, all of which have been distributed. A few ships, however, are not yet provided with the new weapon. A number of naval officers are understood to be opposed to the new rifle, their objections being based on the smallness of the bullet. The Chief of the Bureau of Ordnance, Captain O'Neil, however, and other rifle experts, hold the new arm to be the best weapon yet produced for the purposes of navy use.

In spite of the strong opposition which exists in the city of Philadelphia to the leasing of the municipal gas works, Mayor Warwick of that city on Saturday signed the ordinance recently passed by the City Councils agreeing to a lease of the works to the United Gas Improvement Company, under a rental of $1,000,000 a year for 30 years, the company agreeing to spend $5,000,000 on improvements in the works. The value of the plant is estimated at $30,000,000.

TRADE REPORT.

METAL MARKET.

Pig Tin.—There has been a very good movement of stock into consumption and into interior distributive channels. The arrivals, or the equivalent, thus far this month have, in fact, been so closely taken up that wholesale prices hardened without speculative support or "official" boltsering. A fair retail trade is reported. Jobbers quote 14¾c. per lb. for Straits Pig in small parcels. The shipments from the Straits during the first half of November were cabled as having been only 1485 tons, of which 675 tons were consigned direct to the United States.

Copper.—The demand has not improved, and competition between several sellers has increased somewhat. Nothing remarkable has occurred in this connection except the formation of a basis for surmise that the market is not actually as steady as it may be made to appear on the surface in some quarters. In any event, more buyers than one claimed that no great difficulty would be experienced in placing orders for Lake Superior Ingot at ¼c. below the "nominal" prices. The export demand has been slow, and dealings in both wholesale and retail lines were very moderate. Prices for small lots from stock remain at about 12c. to 12¼c. per lb. for Lake Ingot and 11c. to 11¼c. for Ansonia Grade Casting Copper. The Copper statistics just issued by John Stanton show that the exports in October were only 8875 tons, as compared with the maximum of 13,728 tons in July.

Sheet Copper.—The local demand has eased off to some extent, and orders are irregular. Consumers are apparently buying to fill present requirements solely; as jobbers report almost all recent orders to have been for spot shipments. There has been but little purchasing for stock. Nevertheless, the aggreagate of orders for Cornice Copper in New York and its close vicinity during the past two months has been large, and considerably in excess of the corresponding period of last year, showing a liberal consumption of this material. Jobbers' prices for Sheet Copper in small lots are nominally on a basis of 15c. per lb., but some dealers are selling at lower rates.

Pig Lead.—Operations have been on a very moderate scale, and the buying interest generally has continued very tame, as is not unusual at this season of the year. Wholesale prices have slowly declined. Speculative interest has continued extremely tame, and is without influence on the market at the present time. In a retail way, sales have been merely fair in total amount, while prices are somewhat weak. American Pig in small lots is generally quoted at 4⅛c. to 4¼c. per lb.

St. Louis advices are as follows: Further weakness is noticeable in this department. Consumers have allowed their stocks to run down, and it is expected that they will enter the market before the end of the month, and if so some advance in price is likely to follow.

Lead Pipe and Sheet.—A very narrow business is reported in these materials. The consumptive demand is unusally slack with no immediate prospect of expansion, as the requirements of the building trades for the current season have been pretty well satisfied, while dealers and consumers are not laying in much in the way of stock. Stocks in second hands, however, are not heavy. In sympathy with the weakness in Pig Lead, the Eastern manufacturers have again lowered the prices on manufactured Lead to 5¾c. for Pipe and 6¾c. for Sheet, subject to the usual trade discount

Spelter.—Dealings have been on a very moderate scale, and the demand at present is slow, Eastern consumers apparently being quite well supplied. Wholesale prices are slightly weaker, but jobbers have made no reduction in their quotations for good Western brands in small lots from store. These rule at 4.65c. to 4.75c. per lb.

St. Louis advices are as follows: There is no improvement to note in Spelter. All kinds of prices prevail, and it is difficult to diagnose the market with any degree of accuracy.

Sheet Zinc.—The consumptive demand is of the ordinary routine nature which has characterized this material for many months past. Prices are unchanged. Jobbers quote 600-lb. cask lots at 5⅝c. to 5¾c. per lb. and smaller quantities at 6⅛c. to 6¼c.

Antimony.—Sales have been of ordinary jobbing character, and moderate, all told. Prices for small parcels remain quite steady, however, at 7¼c. to 7½c. for Japanese, 7¾c. for Hallett's and 8½c. to 8¾c. for Cookson's.

Aluminum.—There is no change in this metal, for which a fairly steady demand continues. Present prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—No improvement whatever in the demand has been developed during the past week. The market remains in a condition of abnormal dullness. Rather sharper competition for future deliveries is noted among the American mills, but it has called forth a very moderate response from either can makers, canners or jobbers. Some unusually low prices are said to have been mentioned for extended deliveries, and a few good sized orders were booked, but the volume of dealings, all told, was disappointingly meager. Spot goods are still rather difficult to secure, and mills are generally behind hand in their deliveries. Some abatement of the late stringency is noted, however. The mills are all busy, and will be so for the balance of the year. Some of them have enough work booked to carry them on without further orders until the second quarter of 1898. But a larger number of makers seem anxious to secure work ahead than were in evidence a week or two ago. To this extent, therefore, the market is somewhat weaker. The retail trade has also experienced a dull week, the run of retail orders being comparatively light in this vicinity. Prices, while somewhat easier, show no quotable change. Jobbers' quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3 45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are selling in a small way only outside of the exporting canning trade, and prices are largely nominal. Stocks of Foreign Plate are lighter than ever before.

A special London cable dispatch of November 17, 1897, reports on the British Tin Plate market as follows: Tin Plates are steady at prices on the basis of about 9s. 6d. for ordinary Bessemer Cokes, but in only moderate demand. Makers, however, seem more inclined to take orders for forward delivery at current prices. More inquiries have been received from 'Frisco and British Columbia for full weight Cokes. Oil men are endeavoring to contract for spring delivery, but their low limits on prices restrict business. Stocks at Swansea are 86,030 boxes.

Sheet Iron.—Business with the mills is somewhat less active, although some fairly large orders were booked for Black Sheets of light gauge. Jobbers' orders for both Black and Galvanized have been running very light. Prices are unchanged. Jobbers in this section quote small quantities from stock at 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: Black Sheets are not quite so active, although the demand is somewhat better for Heavy than Light Sheets. The mills are still busy and holding quotations firmly. Galvanized Sheets are again in better request. The demand from mill may not be quite so heavy as in October, but shipments from stock are more active than they have been. Small lots from stock are held at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—The market has been very quiet with sellers offering concessions to effect business in all lines, and only moderate sales. The export demand for Scrap metal was light, and prices rule rather lower. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3.05c.

Zinc	per lb. 2½c.
Zinc Dross in slabs	per lb. 2.60c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10 50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

THE IRON MARKET.

No decisive movement in either direction has yet taken place in the Iron trade of the country. The balance is evenly poised, and while there are indications that it is swinging in a direction adverse to sellers, too much significance should not be attached to that fact. We know of instances where shrewd, experienced managers of large interests hesitate long what course to pursue in making bids on contracts which involve deliveries extending far into 1898. The temptation of securing work for the winter months by concession is great, but when there are coupled with it engagements beyond that period the risk of being tied up when the time for reaping profits comes is regarded as a serious contingency. We find that this faith in a lively and profitable business in 1898 continues unshaken.

Steel is weaker in Pittsburgh, chiefly because offerings have been made by buyers and consumers who find that their requirements have been overestimated. The mills are not selling at the lower prices named, which have reached $15, maker's mill, in the Central West.

Wire Rods, which have occupied an abnormal position for some time past, are off to $22 at seller's mill at some points in the Central West, the business being light.

In the general lines of Finished Iron and Steel matters are very quiet. While a good deal of work is coming up, it must be recognized that it takes a tremendous tonnage to keep the great mills in fair humor.

In Foundry Iron the markets are quiet. However, consumption seems to be keeping up at a heavy rate, since furnace stocks South and North are still being drawn upon.

Pig Iron.—The NewYork market is quiet, orders being only of a routine character. Some large interests have made inquiry, but have shown no disposition to take bold as yet. Statistically, the situation is sound. The leading Southern company had reduced their stock to about 30,000 tons a few days since, as against 167,000 tons earlier in the year. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

The Philadelphia Pig Iron market is very quiet, large buyers having pretty well withdrawn from the market until it is seen how prices are likely to go. Nobody expects much change, aud there is just a possibility that the change may be in sellers' favor, but, however that may be, buyers are inclined to wait for something more definite than is shown by present conditions. Sales during the week have been within the following range for seaboard deliveries, with the usual allowance for freight differences at points within 100 miles south and west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

The demand for local Coke in Chicago is not so large as early in the month, but is still considerably better than had been anticipated. The volume of trade is now smaller than shipments, but the furnace companies have booked such a large amount of business that they could pass through a period of quiet trade lasting well into the next year without accumulating much Iron. Southern sales agents report a moderate business with some little inquiry from buyers. The inquiries for local Iron project well into the future and some consumers would now like to purchase for delivery up to June at present prices or a slight concession. The producers, however, are asking more for such deliveries. The key to the situation as to prices is the attitude of Southern manufacturers. They are, however, well supplied with orders at present and consider the prospects for the future so good that they are not disposed to make concessions. The indications, on the other hand, are regarded as pointing strongly to higher prices. The demand for Lake Superior Charcoal is quiet. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

Outside of purchases of several round lots of Bessemer Iron by a Steel interest for delivery next year there has been little done in the Pittsburgh market. For balance of the year Bessemer is firm at $9.60, Valley furnace, and offers of $9.50 have been refused. It is not improbable that Bessemer Pig is about as low as it will go. Foundry Irons are weak and lower. No. 2 Foundry is weak at $10.25, Pittsburgh. We quote as follows, f.o.b. Pittsburgh: No. 1 Foundry, $10.75; No. 2 Foundry, $10.25; Bessemer, $10.25.

The Cincinnati Pig Iron market shows no material change from the condition reported a week ago. There is no buying movement at all excepting the customary run of minor orders, and it is a matter of extreme difficulty to figure out a near movement of buyers from the very limited amount of inquiry which presents itself. The chances now seem remote for very much more new trade until after January 1. As to prices, there is nominally no change and no clearly defined circumstances which would indicate anything like an immediate change as very likely. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The St. Louis Pig Iron market is practically unchanged. Agents report very few sales, and what few are taken are mostly confined to carload lots. There continues to be sales of Warrant Iron at prices which average about 25c. per ton below the figures asked for ordinary brands, but at this writing these sales have had no appreciable effect on prices. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—Trade has fallen off still more, and the demand is now quite light from consumers. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3 75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5 50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9 c.
Red Brass	....	7½c.
Yellow Brass	....	6½c.
Light Brass	....	4 c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Business is below its normal volume for the season, and prices are still weak. The card on carload lots of 12 tons minimum is now as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

General business, all things considered, continues to move in fair volume, and in some sections the reports are encouraging. While it would be unreasonable to expect a rushing trade at this advanced stage of the season, there seems to be little doubt that there is a healthful distribution of goods in constant progress, and the jobbers, especially in the West, appear to have little reason for complaint. Trade in the South has been interfered with to a serious extent by the prevalence of yellow fever and the apprehensions of its spread, but it is hoped that the disturbing influence of this scourge will soon be removed and things resume their normal course. The very low price of cotton is having a depressing effect on business in that section, and the more so because there is a tendency to hold the crop in the hope of realizing better prices. The crop, however, is a large one, and this may in some measure make up for disappointment in regard to the price. Manufacturers almost uniformly refer to the improved conditions which are prevailing, and regard the outlook for future business as very promising. A weakness in a few lines is to be noted, and, on the whole, the tone of the market is not quite so confident as a short time ago. The next month or two will naturally witness a moderate business, but it is hoped that the market will hold its own pretty well and leave things in good shape for the large and more satisfactory business which is anticipated the coming year.

Advices from Chicago.—A better business is being done in Shelf Hardware. More seasonable weather now prevails throughout the Northwest, and this is naturally increasing the demand for winter goods. Coal Hods, Stove Boards, Elbows, &c., are being called for in larger quantities than had been expected. Stocks of these proved to have been smaller than anticipated. Sorting up orders are also being received for the general line of Hardware to a somewhat greater extent than for the past three or four weeks. While House Furnishing Goods are not at present very active, the falling off in this direction is made up by the demands for Tools, Cutlery and other classes of goods which are more profitable. A specially heavy movement is noted in Galvanized Sheets, as well as in goods made of such stock. Heavy Hardware jobbers report a more active demand in their line. The small shops are doing a great deal of repairing, while manufacturers are steadily drawing supplies from jobbers' stocks. Large orders are being received for wood stock from wagon makers. An active winter trade is looked for in this direction. Collections continue very good.

Advices from St. Louis.—The Hardware jobbing trade continues in the excellent condition last noted. The demand from the South and Southwest continues and tends materially to strengthen prices, which are inclined to be a trifle weak in some directions. Staple goods are being pushed, and some attractive prices are named, so as to reduce stocks to as low a point as possible for the annual inventory. This applies largely to Wire Nails and Barb Wire. Galvanized and Black Sheets are in good demand, as is also Tin Plate, but prices quoted on the latter are very low, especially for Terne Plate. Shelf Hardware is moving in good volume, and holiday goods are being ordered very liberally. Collections are quite satisfactory.

NOTES ON PRICES.

Wire Nails.—The demand for Wire Nails is only moderate, most of the jobbing houses apparently having ample supplies for the present and in some cases being in a position to sell at lower prices than the manufacturers have recently been quoting. The tone of the market is not especially strong and slightly lower prices are obtainable. New York quotations are $1.65 for small lots from store.

Advices from Chicago.—The local jobbers still appear to have excessive stocks and are making efforts to move them at inviting prices. Jobbers are selling small lots from stock at $1.50 to $1.55.

Advices from St. Louis.—The market continues weak and unsettled. Some mills are inclined to maintain prices, while others are disposed to be free sellers and shade prices accordingly. The demand at this season of the year is never heavy, and it is doubtful if the shading of prices will increase the demand to any appreciable extent. Jobbers ask $1.55 to $1.60 for small lots from store.

Cut Nails.—The Cut Nail market is in a somewhat unsatisfactory condition and is characterized by a rather weak and unsettled tone. The volume of business is only moderate. The market is at present an open one and there is a good deal of competition between the different mills. Those favorably located naturally endeavor to obtain somewhat better prices where they can do so. New York quotation for small lots from store is $1.40.

Advices from Chicago.—The trade in Cut Nails is of very moderate volume and prices for small lots are continued at $1.45.

Advices from St. Louis.—The demand for Cut Nails is very light and prices weak. Jobbers are selling small lots from store at $1.55, base.

Barb Wire.—The Barb Wire market is sluggish. Prices are unchanged.

Advices from Chicago.—Heavy shipments continue to be made by factories which have not yet begun to accumulate stock for spring trade. Prices in this line are unaffected by any disturbances among the jobbers. Quotations are continued at $1.60 for Painted and $1.90 for Galvanized in small lots from stock.

Advices from St. Louis.—The demand for Barb Wire is not heavy and prices have suffered in consequence. Jobbers ask $1.60 for small lots of Painted and $1.90 for Galvanized.

Stove Pipe and Elbows.—Manufacturers report an active demand for Stove Pipe and Elbows, and experience some difficulty in shipping goods sufficiently promptly to meet the requirements of their customers. In this condition of things the tone of the market is slightly stronger where manufacturers are in position to make immediate shipment. The demand is referred to as especially active in the West.

Coal Hods.—It is evident that some of the trade deferred their purchases of Coal Hods to a later date than usual, and as a result rush orders are being received by manufacturers and jobbers. Owing to this cause a slight stiffening in price is noticeable.

Tacks.—We have already noted the efforts of some of the Tack manufacturers to secure better prices for their product, and on the whole there has been a slight improvement in the market. It is the opinion of well informed parties that higher prices will prevail on account of the increased cost of material, and especially so if manufacturers continue to have difficulty in obtaining metal from the mills. There are, however, a number of manufacturers who are apparently willing to sell at about the old prices, and the more conservative manufacturers are disposed to let them take orders which are going at what they regard as unremunerative prices. The divergence in the quotations made on the different kinds by different manufacturers calls for very careful purchasing on the part of close buyers, but of late the tendency has been toward more uniformity in quotations.

Shot.—In the market for Shot another change in price is to be noted, together with a continuance of the diversity which has prevailed between Eastern and Western manufacturers. It is to be noted also that the manufacturers have made a modification in the classification of Shot, as shown in the following prices, which are the regular card prices in the East :

Drop Shot, sizes smaller than B, per 25-pound bag	$1.22
" " " " " " " 5 " "	.30
" " B and larger sizes, per 25-pound bag	1.47
" " " " " " " 5 " "	.35
Buck Shot, per 25-pound bag	1.47
" " " 5 " "	.35
Chilled Shot, per 25-pound bag	1 50
" " " 5 " "	.35
Dust Shot, per 25-pound bag	2.00
" " " 5 " "	.50

The Western prices are 10 cents lower per 25 pound bag. The usual abatement of 10 cents per 25-pound bag in lots of 80 bags is made, and, it is intimated, is sometimes given on smaller quantities. The St. Louis price, as noted in our last issue, is $1 base.

Sheet Lead, Lead Pipe, &c.—Under date November 13 the following reduced prices on Lead Pipe, Sheet Lead, &c., are announced. They are subject to the usual discount of 20 per cent. to the trade :

Lead Pipe	per lb.,	5¾ cents.
Sheet Lead	"	6¾ "
Tin-lined Lead Pipe	"	12½ "
Block Tin Pipe	"	30 "

Gas Pipe Stocks and Dies.—Owing to the active competition on Gas Pipe Stocks and Dies the market is not as steady and uniform as it has been, and in some cases manufacturers are quoting slightly lower prices.

Poultry Netting.—Competition between the manufacturers of Poultry Netting is decidedly active and present indications do not point to a stronger market in the near future. Many of the jobbing houses are booking orders from the retail trade covering their requirements for next season at prices substantially the same as ruled last season, though in some cases they are slightly lower.

Glass.—The demand for Glass in the East continues very light, owing largely to the mild weather. Glass has not been needed for closing in buildings in course of construction, as there has hardly been a night in which plaster would freeze. When settled cold weather arrives an increased demand is expected, when it will not be so much the price of Glass as obtaining it at any price. In fact, manufacturers' quotations are of little significance, as sales that are being made are at an advance on the discounts announced. Under the anomalous condition, it is not probable that the manufacturers will make any advance in prices at present. Each one is getting as large a price for the remainder of his product as possible. Animated by a corresponding spirit, New York jobbers advanced prices on November 12 to 60 per cent discount. They do not disguise the fact that the price is unnecessarily high, but ask it because they can get it. Chicago jobbers are expected to take similar action.

White Lead.—There has been merely fair business for the season. Neither dry Lead nor Lead in Oil was purchased in other than hand to mouth way. The demand has been of ordinary character also, with interest confined mostly to moderate quantities for early delivery, and prices remain without radical change.

Red Lead.—The movement of Red Lead has been only fair, yet probably up to the average for the late autumn period, and prices remain almost stationary.

Linseed Oil.—The price of seed has moved somewhat higher, and the market for Oil is naturally stronger, as neither the associated nor independent crushers can find enough margin of profit to provoke any unusual competition. The demand has been running rather light, however, and is only fair for this period of the year.

Old Rags, Paper, &c.—The market is quiet, but prices remain firm. Dealers are paying about the following rates for New York city delivery :

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅞c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ⅝c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to ⅝c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅝ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅝ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	⅞ to 7/8c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures :

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

The Board of Managers of the Joint Traffic Association have fixed the standard time for fast trains between Chicago and New York at 26 hours and between St. Louis and New York at 30 hours. All trains making the run in less time will be considered as excess fare trains.

The hammer shops of the Cumberland Steel & Tin Plate Works, Cumberland, Md., recently burned, are to be rebuilt.

According to the *Post-Intelligencer* of Seattle, Wash., there is a likelihood of the erection in that city of a large plant for the manufacture of Tin Cans. Irving Ayers, treasurer of the Pacific Sheet Metal Works of San Francisco, Cal., was lately at Seattle investigating the advantages of locating such an industry there and laid a proposition for its establishment before the Seattle Chamber of Commerce. The object of the proposed Can factory would be to supply the Salem packers of Puget Sound. The Pacific Sheet Metal Works have for some time operated a Can factory at Astoria, Ore., and they have recently opened another at New Westminster, B. C. During the past season they shipped from Astoria to the Sound 9,000,000 Cans, besides supplying the Columbia River canneries In New Westminster the city gave the company exemption from all taxes for ten years. A Can making plant was also established by the same concern recently at Los Angeles, Cal.

General Wade Hampton, United States Commissioner of Railroads, has submitted to the Interior Department his annual report for the fiscal year ended June 30, 1897, which period, he says, marked the low water mark of railway construction in the United States. During the year 34 companies, with 5441 miles of road, passed into the hands of the courts, and 58 others, previously placed in receivership, were sold under foreclosure.

Henry L. Schwarzenberg, dealer in Scrap Iron and Metals, has removed his office to 407 Cuyahoga Building, Cleveland.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Annunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.
Chapter IX.—Running Wires in Finished Buildings.

Instructions on Joint Wiping

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

THIS volume has been compiled from the extended series of articles in *The Iron Age*, on the arrangement of Hardware Stores, and contains a large and varied mass of information in regard to store arrangement.

A chapter is devoted to each subject and all are fully illustrated.

The summary of contents will convey an idea of the wide scope of the work, which treats of almost every subject connected with the arrangement of Hardware Stores.

Every hardware merchant should have a copy.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V BURR.

166 pages, illustrated throughout, cloth, price, **$1.00.**

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII.—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

G. E. BISHOP, - - Dowagiac, Mich.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

DESIGNERS AND BUILDERS OF

TOGGLE DRAWING PRESSES, DROP HAMMERS, GANG SLITTERS, ADJUSTABLE POWER PRESSES, PUNCHING PRESSES AND DOUBLE SEAMING MACHINES FOR WORKING SHEET METAL.

Award for Toggle Drawing Presses

At the Chicago Exhibition, 1893, Reads as Follows:

Two rockshafts, one on the front and one on the back of the press frame, are used. to which the blank holder slide is connected by means of toggle links. These rockshafts are operated from the main shaft by a peculiar system of link work which imparts through the blank holder a uniform pressure to the blank. The strain arising from pressure put upon the blank is transferred through the straightened toggle directly to the frame of the press, thus relieving entirely the bearing from all friction and wear due to the blank holder and insuring smooth work, great durability and less consumption of power. The automatic friction clutch on these presses acts practically instantaneously and avoids entirely the heavy shock which tends to destroy the clutch parts.

A TESTIMONIAL.

From **HABERMAN MFG. CO.**, Manufaeturers of Tin and Enameled Iron Ware.
NEW YORK, Dec. 30, 1895.

* * * * * * We would say that we have used cam drawing presses of several makes and designs, and find none of them equal to your toggle drawing presses for accuraey and speed of production, or for convenience and solidity of construetion.

QUICK MEAL

STEEL RANGE.

The name tells the story of its convenience.

When we began manufacturing the Quick Meal Steel Range, we had foremost in our minds to make it the "Dealers' Range." A range that would satisfy and meet every demand made upon the dealer. A range in which the dealers' interest would be identical with our own. We know our efforts in this direction have been appreciated. Valuable suggestions have come from dealers and credit is due them for their assistance in perfecting the "Quick Meal." Every suggestion has been carefully considered; every detail, however small, closely examined; every part thoroughly tested. The result is that many of our dealers tell us the "Quick Meal" Steel Range is equal to the best, while the rest say, it is much better than the best.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.

MY DEAR SIR:

In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal

Very truly,
I. N. EVANS.

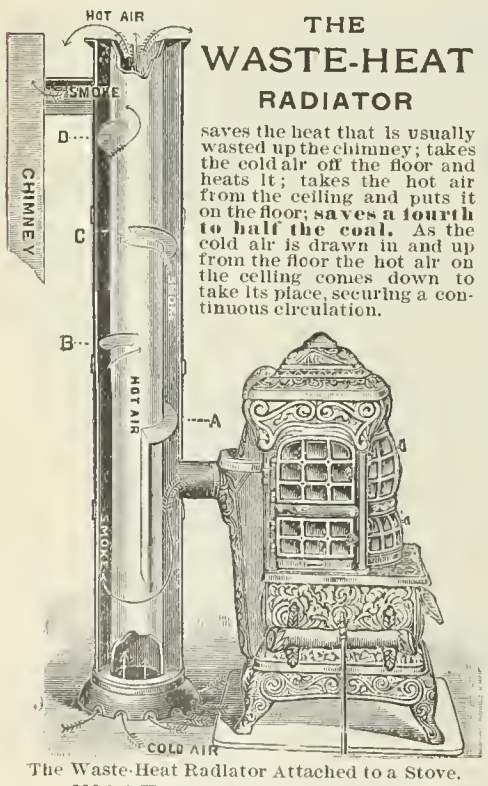
WOOD AND COAL.

No. 36 La Salle St., CHICAGO, ILL.

The Moncrief-Dowman Co., = = Atlanta, Ga.



The Waste-Heat Radiator Attached to a Stove.

THE WASTE-HEAT RADIATOR

saves the heat that is usually wasted up the chimney; takes the cold air off the floor and heats it; takes the hot air from the ceiling and puts it on the floor; **saves a fourth to half the coal.** As the cold air is drawn in and up from the floor the hot air on the ceiling comes down to take its place, securing a continuous circulation.

TO STOVE AND FURNACE DEALERS:

DEAR SIRS:—The Waste-Heat Radiators have been in use in Minnesota and other parts of the Northwest, where the thermometer often registers thirty to forty degrees below zero, for the past three years and have been thoroughly tested, so they are no experiment; but until within the past few months, they have been made only in a limited way, as each one had to be made to order owing to the difference in the height of the collars on different stoves and furnaces, but now we can make them with sliding collars and that they can be adjusted to fit any stove or furnace, therefore can make them in large quantities and do a general business in them.

The following people have used them during the past two or more years, to any of whom we refer: W. W. Rand, Sec'y Minneapolis Gas Light Co., Minneapolis, Minn.; J. C. Oswald & Co., Minneapolis, Minn.; Wm. Cunningham, St. Paul, Minn.; R. A. Lanpher & Co., St. Paul, Minn.; M. M. Gasser Co., Duluth, Minn.; W. W. Schiffman, Duluth, Minn.

The letter printed herewith from Mr. Clifford Hubbell, Cashier of the Columbia National Bank, Buffalo, N. Y., speaks for itself.

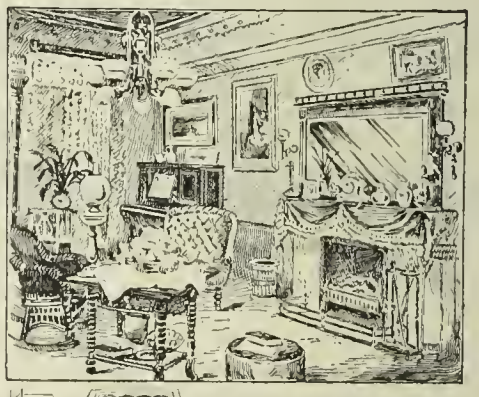
COLUMBIA NATIONAL BANK OF BUFFALO.
JOSIAH JEWETT, President.
CLIFFORD HUBBELL, Cashier.

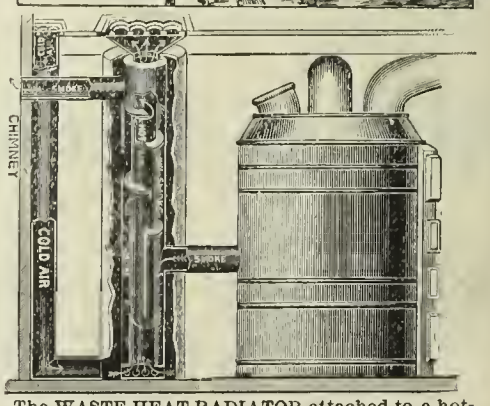
BUFFALO, N. Y.

DEAR SIRS:—Regarding the Waste-Heat Radiator which you placed in my residence, No. 71 Highland Ave., I have to say that it has worked admirably. I believe that the furnace burns 25% less coal now than formerly, and I think that that percentage is a very low estimate. In my mind the greatest advantage is that it draws the cold air from that part of the house where the cold air most accumulates, and makes the temperature in the rooms much more even, conducing thereby to comfort and healthfulness. I know that my wife, being skeptical about patent inventions of any kind, before this was put in, has come to acknowledge that this accomplishes the purposes for which it was purchased; viz., to save a large portion of the waste heat that goes up the chimney, and to save in the amount of coal burned, and make the temperature more even.

Yours respectfully,
CLIFFORD HUBBELL, Cashier.

In order to introduce our Radiators we will send one to any reliable Stove or Furnace Dealer and if he finds it as we represent it then we want him to buy it and take the exclusive sale of them in his city; otherwise to hold it subject to our order. Yours truly,





The WASTE-HEAT RADIATOR attached to a hot-air furnace; attaches to steam and hot-water boilers in the same way.

STEAM AND HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.

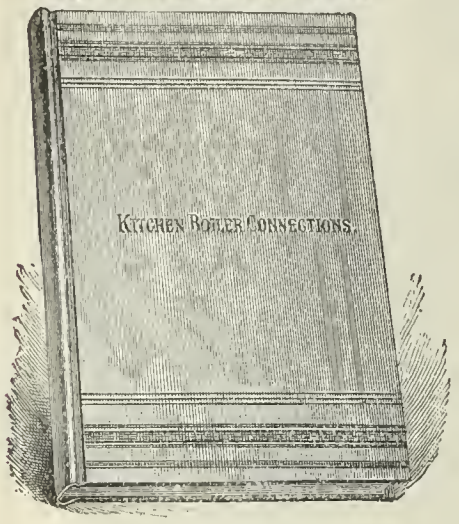
KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Sent Post-paid on receipt of Price $3

Cleveland, O.

—FIVE years ago a man named Volgt stole a ride on a railroad in Colorado. Recently he became a Christian, and was smitten with remorse to such an extent that he sent a written confession to the company, inclosing $1.56, being his fare at the rate of three cents a mile, with interest added. As a matter of fact, the fare at that time was four cents a mile, and the company has sent the man a demand for 52 cents in addition.—*N. Y. Tribune.*

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

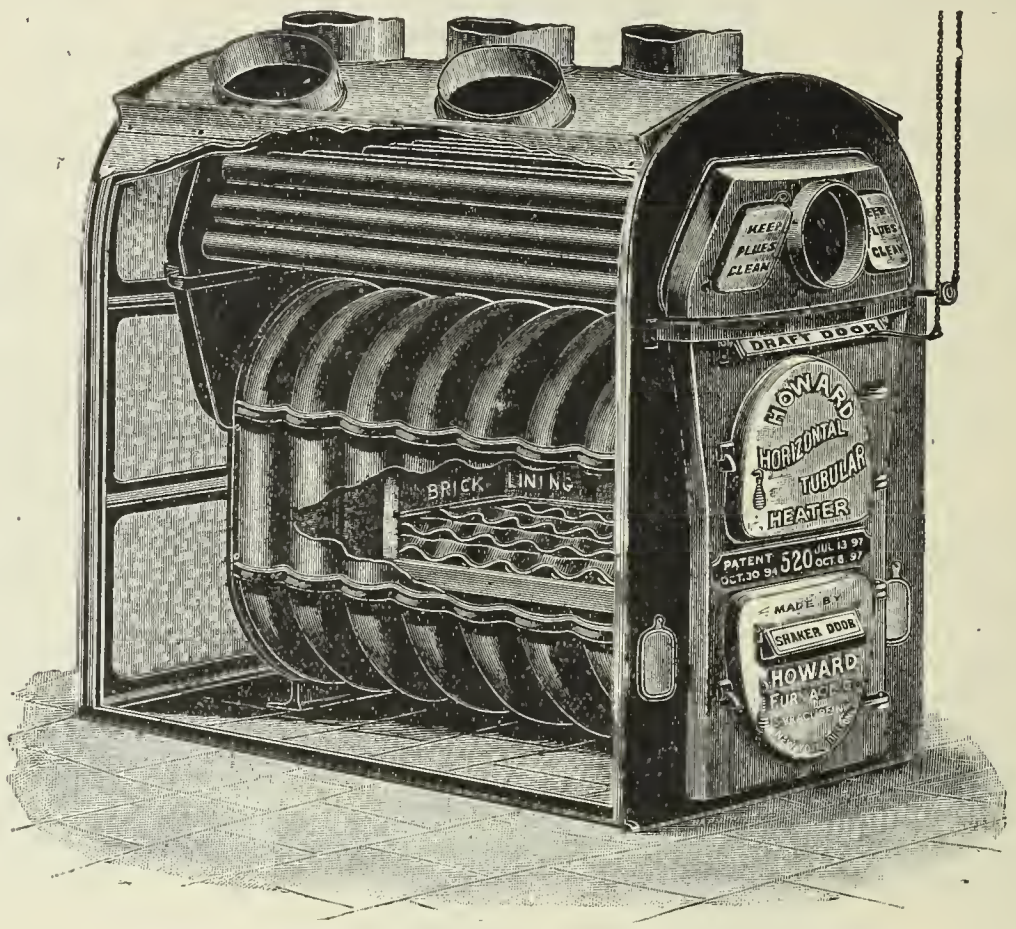
for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

Sent, Express or Postage paid, on receipt of price, FIVE DOLLARS, by

DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., New York.

a succinct statement

Some manufacturers of furnaces have an idea that they can fool the dealers by talking about a large flue radiator. The proper way to utilize the fire travel is to retard the draft. The impinging properties of the heat are in this way gained. If the fire travel be split up into a number of small flues, immediately after leaving the combustion chamber, a retention of heat is obtained, and five (5) times more heating surface is exposed for generating warm air.



Patented: Oct. 30, 1894. July 13, 1897. Oct. 5, 1897.

does this astonish you?

The truth of this statement is aptly illustrated in the cut, which shows a tubular constructed radiator. It is a self evident fact that if the above radiator were made in one large flue, the heat in its travel to the chimney would be quickened, a less contact surface given and a cooling influence avoided.

The Business Situation.

The approach of the close of the year and the holiday and stock taking season is reflected in a general slackening of trade in wholesale lines. Merchants and the larger consumers are generally confining their orders for goods to such limits as will fill their current needs and carry them over into the new year with the smallest volume of stocks in hand necessary to meet their requirements. The retail trade, however, has been feeling the stimulating effect of colder weather in an increased call for winter goods in all parts of the country. Southern trade is reviving and reports from that section, as well as from the West, indicate an unusually large movement of retail business for the season of the year. Bank clearings last week, while rather below the exceptionally heavy total of the previous week, were still large and considerably in excess of last year's figures, showing more activity than in the corresponding season of any previous year except 1892, when speculation was abnormally active. At the present time stock exchange speculation is remarkably flat, so that the figures were swelled by actual commercial transactions. Wheat has again shown an upward tendency, cash wheat in New York passing the dollar mark during the week. The exports of the cereal so far in November have been about 50 per cent. greater than last year. In the past week they were among the heaviest on record. Atlantic exports amounted to more than double last year's shipments, owing to the heavy European call for American breadstuffs—a call which, from all appearances, will continue indefinitely, or until all our spare stocks are exhausted. There is no change worthy of note in connection with the leading industries. The iron and steel trade is quiet, as regards new business, with prices a shade lower in a few directions, and no special improvement looked for in the next two or three months. The metal trades are dull to the verge of stagnation, and the trades catering to the building industry are almost equally lethargic. All speak hopefully of the outlook for next year, however, and are making preparations for a good business in the spring. The plethora of idle money in the New York banks serves to keep the local money market extremely easy. The banks are now seeking employment for their surplus funds in the London market, where they are offered at rates which are lower than those prevailing in that center. Should this movement assume large proportions the effect would be a stiffening of loaning rates here. The demand for commercial paper is brisk and far outstrips the offerings of good material. Collections are generally reported as satisfactory.

Local papers of the Indiana gas belt are commenting very strongly upon the deplorable waste of natural gas that is going on in parts of that region. An alarming decrease in gas pressure exists at various places, especially in Madison County, where a number of important industries are dependent upon the gas for fuel. The waste is attributed to the operations of the oil men, the gas finding an unchecked outlet from a number of the oil wells, and little or no attention being paid to the Anti-Waste Gas law of the State. At Alexandria a particularly unfortunate condition of things prevails in this respect. In that town and vicinity about thirty oil wells exist which, according to the Anderson *Herald*, are throwing out into the air millions of cubic feet of gas daily. It is calculated that these wells are wasting in this way about $9000 worth of gas a day, or $270,000 a month, and as this waste has been going on for several months the total amount of loss is shown to be enormous. There appears to be no way of adjusting the matter. An effort was made to enforce the penalty of $20 a day for the waste, but the attempt does not appear to have been successful and the waste goes on.

Formation versus Reformation.

BY FOSSIL.

It has been written that the poet is born, not made; and the credence which we give this assertion depends upon our definition of the term poet, whether it be liberal enough to cover all claims to the title, or restrictive to a higher standard. In like manner we may say that the mechanic is born, not made, provided we insist upon a strict construction of the word. If the broad and general meaning be taken, we must conclude that there are mechanics, and mechanics, alike in kind, but differing widely in degree; a difference which leads to classification and terms of comparison. Selecting for consideration from the mass of artisans, those who are prospectively eminent, it may be shown that, other things being equal, those who are endowed or born with certain desirable faculties will surpass their competitors who must acquire them by introduction. There is a prophecy in the boy of what the man may become under favorable circumstances; and when the community at large recognizes its right and duty to change the policy of curing evils by pruning to that of prevention by cultivation and training there will be fewer social and mechanical misfits.

Paternity is invested by both natural and civil law with authority, which, while demanding obedience, is under obligation to promote the interests of the subject both present and future, and this duty lacks of fulfillment if confined to the physical wants of infancy. We have, in common with other animals, a care for the young of our kind, running parallel thereto and often subject to the same natural limitation. The power to produce does not give the wisdom to guide, and we do not expect the builder of a ship to be for that reason a navigator; but many men are both fools and fathers.

If it be admitted, as observation teaches, that humanity gives early indication of what its unbiased course would be, or, as may be said—limiting the scope of the subject—the mechanic is born, not made, it follows that if society desires the best results it should concern itself to find out and foster incipient ability. We have established a code of sanitary laws which limit the old time liberty of the individual, making it secondary and subservient to the general good, and this has been done in the face of much opposition. Some of us will remember former battles in the warfare of private versus public advantage, and may recognize a quotation from an old poem which now reads like a fulfilled prophecy :

> " Why, sirs, if we submit in quiet,
> They next will regulate our diet;
> And say by law, we sha'nt eat carri'n,
> Or flesh of beasts that died of murri'n."

Having established the right to punish mechanical ignorance, we may possibly expect that to be an entering wedge toward the right to prevent it, by selection and cultivation of the fittest. Men do not "gather grapes of thorns or figs of thistles," neither do they expect to do so, since a knowledge of the infant plant settles the question of its product if left in normal condition. When we learn that formation is better than reformation there may be a necessity shown for additional public care and direction.

Good Times in Indiana.

A press dispatch from Anderson, Ind., states that compiled reports from every section of the gas belt indicate that over 90 per cent. of the manufacturing concerns are in full operation and 50 per cent. of them are operating night and day. Of the 10 per cent. still idle fully four-fifths are window glass plants, which are closed not because there is a scarcity in demand, but because labor is not satisfied to accept a wage scale which is a 15 per'cent. advance over that of last year, and is holding out for an increase equivalent to almost 30 per cent. advance. The most notable exception to the statement that nearly all plants are operating is the malleable iron works at Marion, which are closed because of various complications.

A year ago only about 60 per cent. of the plants were running, and that 60 per cent. included the window glass houses. Two years ago the percentage was still lower, and three and four years ago the number running was represented by 33 per cent.

More men are at work in Indiana gas belt plants today than at any time before, and their wages aggregate a larger sum than at any time in the past. With possibly three exceptions there has been no reduction in wages. There are many companies who have voluntarily increased wages from 2 to 15 per cent.

European and American Costs of Producing Pig Iron.

An English journal has undertaken to make the following comparison of costs of making pig iron in Europe and in the United States :

Very few people appear to be aware of the great changes that have recently occurred in the costs involved in the manufacture of pig iron in different countries. It has hitherto been assumed, and to a large extent with reasonable accuracy, that Great Britain had facilities for the manufacture of cheap iron that existed nowhere else. Up to a year or two ago that was probably true. So far as Europe is concerned it still remains the case—at any rate, among countries that manufacture pig iron on a large scale. But the conditions that make for the economical production of iron are changing from year to year, and almost from month to month, and it is to be feared that many of these changes do not tend to improve the relative advantages and supremacy of our own country. Our three chief competitors in Europe are Germany, France and Belgium. We still produce pig iron more cheaply than any of them. But we do not produce iron so cheaply as is done, or should be done under ordinarily favorable conditions, in the north of Spain, and we are a long way behind the facts and possibilities of the United States. The north of Spain has the great advantage of cheap ores almost on the spot ; but it has to import most of its fuel from Great Britain. Recently, the development of a coal field in the Asturias has provided the Bilbao region with another source of coal supply, so that it appears to be probable that the cost of fuel will be lowered by and by. As it is, the statistics presented in the following tabular statement show that at Bilbao the cost of a ton of coke is about 21 shillings, against 13 shillings 3 pence at works in Cleveland and 14 shillings at works in Germany (Westphalia), while the Spanish cost of ore, assuming that the works possess their own mines in the locality—as some of them certainly do—is only about 12 shillings per ton of pig, against a present cost of 30 shillings for the same class of ore bought at current prices in Great Britain, and 32 shillings in Germany and Belgium. The cost of fuel in the United States is cheaper than in any European country, and in some cases at least within our knowledge does not exceed 6 shillings per ton of pig. On the other hand, Pittsburgh makers do not enjoy much advantage over our own so far as the cost of iron ores is concerned, owing to the greater distances over which the ores have to be transported. Speaking generally, the cost of producing a ton of Bessemer or hematite iron to-day will only amount to about 37 shillings 6 pence at Pittsburgh, against 49 shillings 6 pence in Great Britain (in the Cleveland district—on the West Coast the cost will be several shillings more), 52 shillings 3 pence in Westphalia, 53 shillings in Belgium and 57 shillings 9 pence in France. In making these estimates we have taken the cost of labor at the furnaces at average rates in reasonably good practice. The details are appended :

Statement Showing the Estimated Average Cost of Producing a Ton of Bessemer Pig Iron in Different Countries, assuming Current Market Rates and Freights.

	Great Britain. Cleveland.	Germany. Westphalia.	Belgium. Liege.	France. Loire.	Spain. Bilbao.	United States. Pittsburgh.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Iron ores..	1 10 0	1 12 0	1 12 0	1 18 0	0 12 0	1 7 6
Coke.....	0 13 3	0 14 0	0 14 6	0 13 6	1 1 0	0 6 0
Limestone.	0 2 0	0 1 6	0 1 6	0 1 6	0 1 6	0 1 6
Labor.....	0 2 9	0 3 0	0 3 6	0 3 3	0 3 9	0 2 6
Sundries...	0 1 6	0 1 9	0 1 6	0 1 6	0 1 6	0 1 0
	2 9 6	2 12 3	2 13 0	2 17 9	1 19 9	1 17 6

These figures do not allow for depreciation and renewals —which are heavy in the iron industry—for petty charges, or for interest on investment ; and when these are added it will be pretty evident that, at the present prices of raw materials, pig makers who have to purchase their supplies in the open market are hardly likely to make a good thing of it. On the other hand, it will be understood that most makers obtain their supplies under more or less special circumstances, such as contracts of old standing or the ownership and working of their own mines. It remains to be seen how far Spain and the United States may in the future push their natural advantages. Both countries have recently been exporting increasing quantities of pig iron, and it would not surprise us if much more were done in this direction.

Hints on Ventilation and Heating.

Mrs. Alice P. Norton recently gave a talk at the Women's Educational and Industrial Union School of Housekeeping, at Boston, Mass. Her subject was "Ventilation and Heating," and many housekeepers and others interested in this plan to study the vexed question of domestic service were present. In considering that which has come to be counted among the lost arts, the ventilation of the modern house, Mrs. Norton said that few patent arrangements are better than a piece of board so placed that the window sash will not shut down. This admits air into the room, but the most sensitive person cannot feel it. Few persons, said the lecturer, comprehend the simple fact that a window dropped just a trifle from the top on each side of a room or hall will change the air, whereas if several are opened wide the sudden cold makes their closing necessary before any air has a chance to enter. Open fire places are inadequate and inexpensive as heaters, but they are good ventilators, especially if they are constructed with that aim. Steam and hot water heating have disadvantages unless the heat is carried into rooms indirectly, whereas a furnace, properly constructed and intelligently managed, should not cause any unhealthfulness.

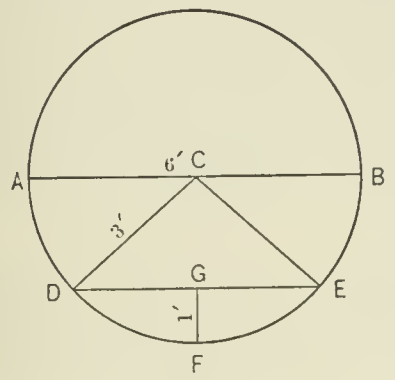
"The great trouble is," said Mrs. Norton, "that we do not supply enough pure air to the furnace, but depend on actual heat from the fire. Put a thermometer down the register and see if you are not surprised at the way it runs up. The cold air box should be well constructed, and as far from the ground as possible, so that no cellar air nor combustible products are carried to the upper parts of the dwelling. A good supply of heat in the halls produces better results than if the rooms only are heated, as the entire temperature then becomes equalized. Rooms well ventilated will heat more quickly than stuffy ones. Members of the family who complain of cold apartments are always the ones who dislike to admit fresh air. Most rooms are kept too hot. The glass should never be allowed to go above 70 degrees, and lower than that is desirable for the average person. As age comes on the body requires more warmth, while children thrive in a low temperature. It is not an uncommon thing for church furnaces to take air from the audience room that has been breathed and heated again, as the plan of providing outside air is considered as too expensive."

THE LETTER BOX.

An Area Problem.

From G. E. S., East Stroudsburg, Pa.—Your rule for finding the area of a segment, in *The Metal Worker* of November 6, is interesting and I have a question of a similar sort I would like to ask. Suppose we have a boiler 6 feet in diameter and there is 12 inches of water in it, what will be the area of the part covered per foot in length with water? We will be glad to have you give a rule for solving this problem.

Answer.—In the accompanying diagram we show a section of a boiler the diameter of which, A B, is 6 feet,



An Area Problem.

and which is filled to a depth of 1 foot, as represented by the line D G E. To find the length of the arc D F E it is first necessary to find the length of the chord D E.

A rule for that is: The chord

$$D\,E = 2\sqrt{D\,C^2 - (D\,C - G\,F)^2} = 2\sqrt{3^2 - 2^2} =$$

$$2\sqrt{5} = 2 \times 2.236 = 4.472.$$

Knowing the length of the chord D E to be 4.472 feet it remains to find the length of the arc D F E. To do this we make use of a table of circular arcs, from which we find the constant opposite the number obtained by dividing the hight G F by the length of the chord D E. Dividing the numbers gives 0.223 and the constant opposite that number in the table is 1.12774. The length of the arc is now found by multiplying this number by the length of the chord, 4.472, which gives as a product 5.04+. Knowing the length of the arc D F E, the surface covered by the water for 1 foot length will be equal to the product of the two, or 5.04 square feet, which is the answer sought by our correspondent.

Loss From Underground Steam Pipe.

From G. W. G., New York.—I wish to run a steam engine with steam taken from a boiler 80 feet away. The steam pipe would be in the ground in a box 12 inches square, the pipe being wrapped with asbestos paper and hair felt and the box filled with sawdust. How much loss will there be in the steam as compared with steam taken from a boiler in the same room as the engine?

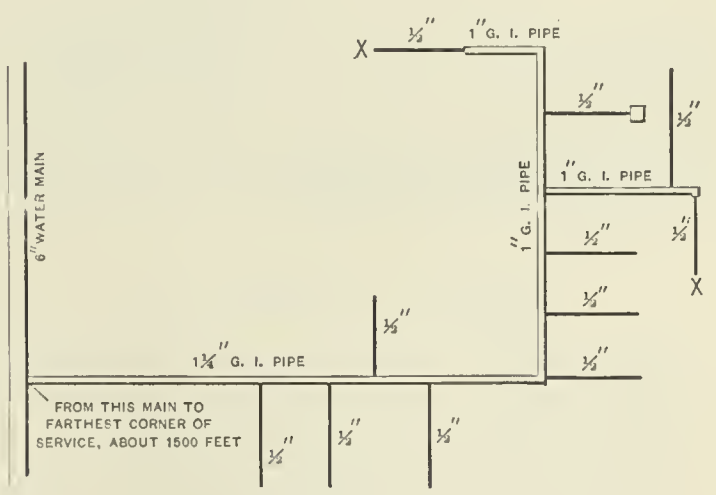
Answer.—With the felting and boxing as described, and with the lack of any details as to size of pipe and power of engine, we can only approximate an answer in the number of heat units lost per hour in several sizes of pipe. We cannot give percentage without knowing size of pipe, pressure of steam and power to be transmitted. We estimate the hourly loss for 2-inch pipe to be 20 heat units per foot of pipe, or 1600 heat units per hour for the 80 feet of pipe; for a 3-inch pipe, 24 heat units, or 1920 heat units per hour, for 80 feet of pipe; for 4-inch pipe, 30 heat units per foot, or 2400 heat units per hour for 80 feet of pipe.

These figures can be turned into coal value by allowing for the boiler output 8000 heat units per pound of coal per hour. This will make the coal loss for the 80 feet of 2-inch pipe equal to 2 pounds of coal per day; for the 3 inch pipe, 2.4 pounds, and 4-inch, 3 pounds.

How to Remedy Water Hammer.

From J. F., Pembroke, Ont.—Inclosed I hand you a sketch of a water main and services taken off the same, with which we are having a great deal of trouble with water hammer. The pipes in almost every house which is supplied by this main hammer to a greater or lesser extent, but in the two services marked X, at the ends of the main, the hammering at times can be distinctly heard 75 yards away. We have carefully examined the plumbing fixtures and cannot find anything wrong with them, and the only theory I can advance is that the 1¼-inch galvanized iron pipe which conveys the water from the cast iron main is too small to supply so many services (11) at such a distance (1500 feet) from the cast iron main. The water pressure varies in this main from 60 to 90 pounds to the square inch at different times during the day. Would you kindly let us know if there is anything in this theory?

Answer.—We do not apprehend that the trouble in regard to water hammer is due to the size of the pipe. The area of the 1¼-inch pipe is more than six times the area



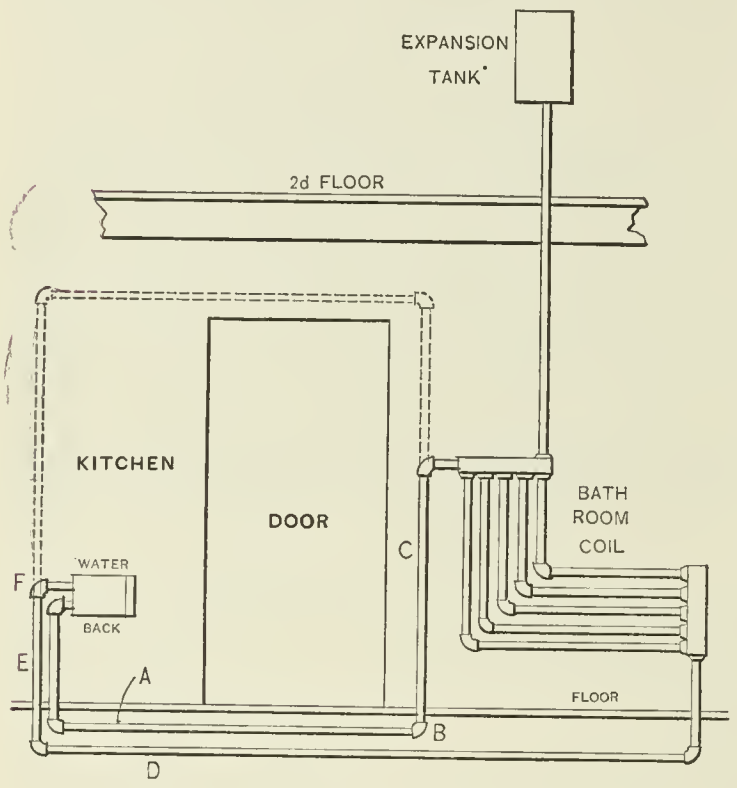
How to Remedy Water Hammer.

of the ½-inch service pipes, and with the high-pressure stated should give a fair supply to all the houses in the ordinary way of using water in dwellings. As our correspondent declares that he can find nothing wrong in the plumbing fixtures there is a strong probability that there is something that is very necessary in high pressure plumbing work that has been left out of the system. The momentum of a column of water in a pipe 1500 feet long is very great, and its sudden arrest by closing a faucet involves an effect like a sledge hammer on the whole network of pipe connected with the line. The longer the column of water put in motion the greater the hammer, which accounts for the excessive hammering at the extreme ends of the line. The remedy for this is found in an air chamber at the principal faucet in each house, which may be made of the same size pipe as the service pipe, and extending 2 feet above the faucet, capped or

closed air tight at the top. This makes an air cushion which gradually arrests the motion of the water when the faucet is suddenly closed, and no water hammer can occur. Water under pressure will, however, gradually absorb the air in the air chambers, when a water hammer will start anew. Then it is only necessary to shut off the service cock of the house and open the faucet under the air chamber, when the water will run out and the chamber will fill with air. Most plumbers understand the need of the air chamber in each house, but it is often neglected or made too small. To show the necessity of a liberal sized air chamber for water works, we may state that at 90 pounds pressure the air that is let into an air chamber 2 feet long above the faucet will be compresed to a length of 3 inches in the pipe, which will answer very well for the shorter distances from the main, but for the ends that have been marked with an X we advise that the air pipe be made 3 or 4 feet long above the faucet, if convenient.

Proposed Plan for Heating a Bathroom.

From S. H. P., Ansonia, Conn.—Will you please inform me if I can heat a bathroom 8 x 8 feet in size by piping it as shown in the sketch presented herewith? Also



Proposed Plan for Heating a Bathroom.

please state whether manifolds or return bends are best for this method of heating? The range which I intend to use for this work is a No. 8 Family Glenwood.

Answer.—It will be necessary to make some changes in the piping before a satisfactory circulation will be secured. In the sketch the return from the radiator connects with the top opening in the water back, which is wrong. The pipe that is intended to take the hot water from the water back to the heating coil makes a drop, which would be a serious impediment to circulation, and it is improbable that the job would circulate if piped as shown. The door between the water back and the bathroom evidently is the cause for this arrangement of piping. To secure a system that will operate it will be better to take out the pipe A B C and connect the return pipe D with the pipe A where it rises, leaving out the pipe E between D and F. At F the pipe should run up to the ceiling and across to the heating coil, where it should drop down and connect with the coil. If the expansion pipe is connected with this pipe at the point where it drops down to connect with the radiator it will have the effect of carrying off any air that might otherwise accumulate in the system and interfere with circulation. The point at which the expansion tank is connected should be the highest point in the system. If the water back is only used for heating the room it will in all probability have ample capacity for the work. The use of return bends would make a longer travel for the water and manifolds would permit a more rapid circulation.

Trouble With Solder in a Copper Tank.

From F. F. H., Woodbury, Conn.—I have lined a tank with copper to hold water coming through a galvanized iron pipe, using half and half solder and acid for a flux. It has been in use for about two years and now the solder seems to be eaten away below the water line, leaving a honeycomb formation which permits leakage. Has any one had a similar experience, and what is the cause? I have lined several tanks in the same way and never have had a similar experience. Who should pay for the repairs—the owner or myself?

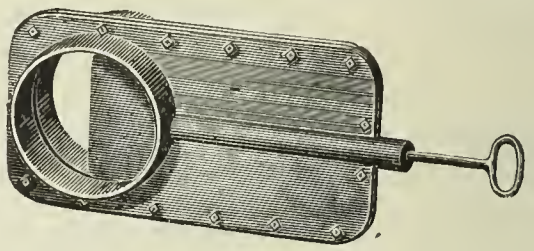
Note.—This letter is evidently addressed to the readers of *The Metal Worker*, and we would be glad if they would answer it. When similar cases have been brought to the attention of *The Metal Worker* we have talked with the manufacturers of solder and have learned that in some instances where solder is sold as half and half, antimony is used to give it the bright appearance that should be furnished by a proper proportion of tin. The result of the use of antimony, even in so small a proportion as 5 per cent., has caused the solder manufacturers considerable trouble, and it is quite possible that the trouble in this case is due to the quality of the solder.

Manufacturer's Address Wanted.

From K. W. G., New York.—Will some reader of *The Metal Worker* please furnish the name and address of the manufacturer of the Orchard gas soldering pot or furnace?

Improved Wind Gate.

The accompanying cut illustrates a new wind gate brought out by Miner & Peck Mfg. Company of New Haven, Conn. It is designed to control and shut off



Improved Wind Gate

the flow of wind in blast forges, cupolas, rolling mill furnaces, &c., and is so constructed, it is stated, that there is no leakage of air. It is made in sizes from 2 inches to 20 inches inclusive. The case is made of cast iron, while the slide is of sheet steel riveted securely to forged handle.

New Publications.

THE ARCHITECTS' DIRECTORY FOR 1897-98. Size, 5 x 6¾ inches; 112 pages; bound in red paper covers with gilt side title. Published by William T. Comstock. Price, $1.

This is the fourth edition of a directory which will be found of value to many in the trade, containing as it does a list of the architects of the United States and Canada, classified by States and towns, with the architectural associations to which they belong indicated against each name. There is also a classified index of manufacturers and dealers in building materials and appliances, thus adding materially to the interest and value of the work for architects and builders. The lists have been prepared with the greatest care to secure accuracy, both as regards names and locations.

Those who contemplate going to the Klondike will be interested in a circular issued by the Yukon Sled Mfg. Company, 107 Weller street, Seattle, Wash., which illustrates and gives prices of the Mascot sled.

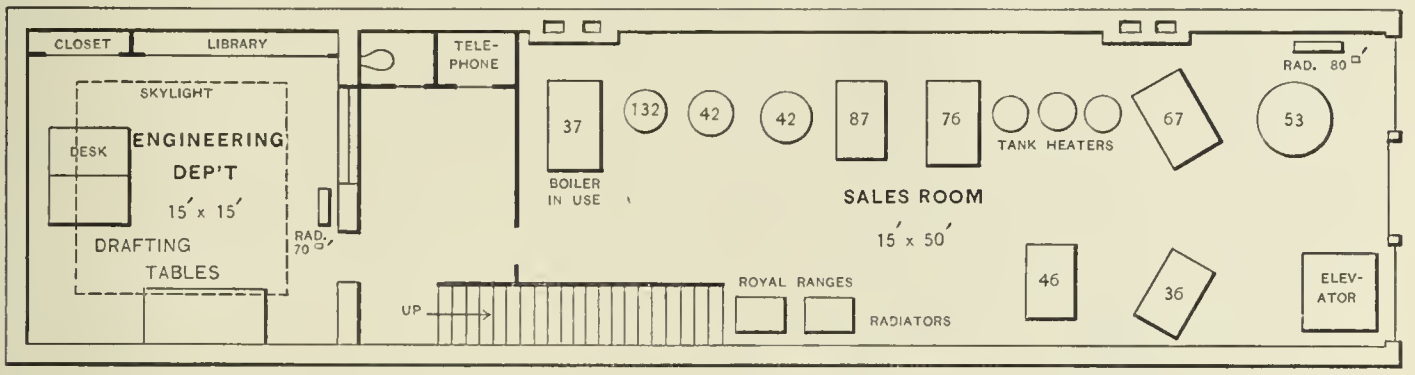
HEATING AND PLUMBING.

HEATING THE HART & CROUSE COMPANY'S SALESROOM.

In many instances the heating contractor is called upon to heat a building, or a portion of it, in which the heating apparatus must be upon the floor that is to be heated. This is particularly true in old buildings where stoves have been used and where there is either no basement or it is unavailable. The problem of circulating hot water through radiators placed on the same level as the boiler is one that has been of great interest to many in the trade, and for some reason is looked upon as a very difficult undertaking. The simplicity of the operation of a properly planned hot water system specially adapts it for such work, though to many it presents new difficulties for solution.

W. M. Mackay, manager of the steam and hot water department of the Hart & Crouse Company, Utica, N. Y., has installed for heating their New York showroom, at 235 Water street, a system of this type which closely resembles in appearance a single pipe steam system, so that those who have not seen a working job of the kind may examine the details when visiting him. For the purpose he has used a No. 37 Royal hot water heater having a grate surface 19 x 24 inches, or about 3 square feet. The arrangement of the heating surface of the boiler is such as to present 63 square feet of surface. This boiler is rated as capable of carrying 520 square feet of direct hot water radiation. In this system there is 290 square feet of surface presented in the various radiators, and in the flow and return mains and branches about 100 square feet of surface more, so that the total radiation which the boiler must carry is about 400 feet. It will be readily seen from this that in this boiler 1 square foot of grate surface is provided in proportion to 21 square feet of heating surface, and that 1 square foot of heating surface in the boiler is designed to carry a little over 8 square feet of radiating surface; but in this case there is but 6¼ feet of radiation to 1 square foot of boiler service. The boiler used is of the vertical sectional type.

Fig. 1 is a plan of the first floor of the building, showing the location of the boiler used and a radiator in the engineering department in the rear and one in the showroom at the front of the building. In order to display different types of radiators an Italian flue radiator presenting 70 square feet of surface is used in the engineering department, and a three-column Triton radiator presenting 80 square feet of surface is used at the front of the building. Fig. 2 is a plan of the second floor, with a three-column Standard radiator presenting 60 square feet of surface in the rear office and a four-column National radiator presenting 80 square feet of surface in the private office of Manager Mackay.



Heating the Hart & Crouse Company's Salesroom.—Fig. 1.—Plan of First Floor.

The piping system may be followed from the view presented in Fig. 3. Two 2-inch mains rise from the header on the top of the boiler, one running to the front, where a 1¼-inch pipe leads to the radiator on the second floor. The return from this radiator is brought back and connected into the 2-inch return pipe. This 2-inch pipe returns all the way to the heater, so that in case the radiator is shut off the circulation will continue. On this 2-inch return, near the first-floor radiator, one of the O. S. distributing fittings made by Oliver Schlemmer, Cincinnati, Ohio, is placed, with the top side down, as illustrated in Fig. 3, to show how a forced circulation can be secured in case of necessity. A 1½-inch pipe leading from this fitting is connected with the first-floor radiator, and the return from the radiator connects into the 2-inch return main. This return pipe connects into a tee immediately below the boiler, with a drip cock at the bottom and the top side connecting with the return header on the heater. The other 2-inch main from the top of the heater connects

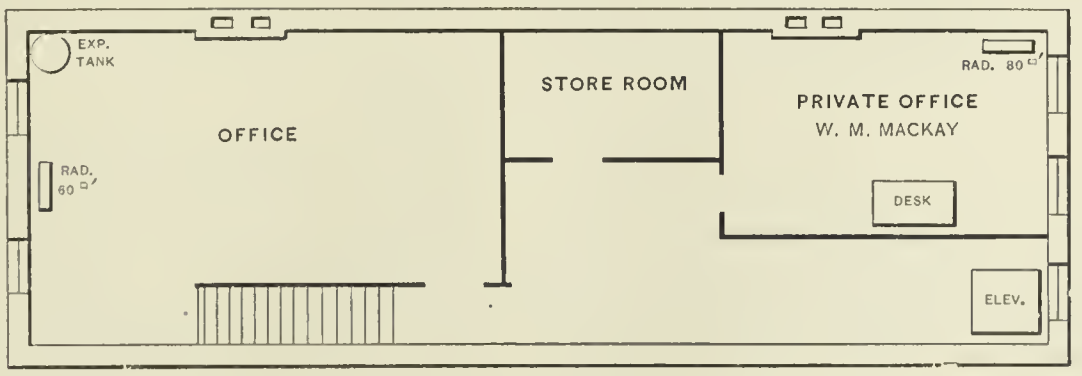


Fig. 2.—Plan of Second Floor.

with a 1½-inch flow leading over to the radiators at the rear of the building. A 1-inch pipe is carried to the second-floor radiator. The main then continues with the necessary turns to a point where it drops down and connects with the radiator in the engineering department on the first floor. The return from the radiator on the second floor connects into the flow main as it continues, so that the flow pipe to the first-floor radiator acts as the return from the radiator on the floor above, and the return pipe from the first-floor radiator serves as a return for both. The return pipe runs to a point beneath the boiler, where it connects with a tee, one side being connected with the header and the other side being provided with drip cock, so that in case of necessity the entire heating system and heater may be emptied.

A 1½-inch pipe from the flow to the radiator on the second floor is carried to an expansion tank, and a ¾-inch connecting with the return from this same radiator is connected with the bottom of the expansion tank to serve as an expansion pipe. The ½-inch pipe is to produce a circulation of water in the expansion tank to show what is considered a proper connection where the expansion tank is placed in an exposed position where it might freeze. An overflow pipe is taken from the top of the expansion tank and carried through the wall of the building. The expansion tank is provided with a gauge glass, so that the amount of water in it can be readily seen at any time.

The water supply to the system is connected with the header on the left side of the heater in the cellar, but in order to show how a boiler system may be filled in cases where there is no supply under pressure, the expansion tank is fitted with a funnel into which water may be poured. The pipe connecting the expansion tank with the funnel is provided with a stop cock, so that when the system is filled the stop cock may be shut off to prevent water being thrown out of the tank through the funnel in cases where heavy firing or bad piping might produce such a result.

In addition to the usual trimmings for automatic regulation the boiler used is provided with a thermometer on the flow and return main in order that the temperature of the water in circulation may be readily seen, and on the front of the flow header is an altitude gauge, so that when the system is once filled and the stationary hand placed in the proper position, the hand which shows the variable pressure will enable the user to see whether the system is full of water or needs replenishing without going to the place where the expansion tank is located and making an examination there. In the case of residences or large buildings in which hot water systems are used the fire tender may always know from the altitude gauge the condition of the water supply without making what would in many instances be a long journey to the expansion tank to secure the same information.

In the arrangement of the sample room a No. 53 Prince Royal combination hot air and hot water heater stands just inside of the door, and just beyond it is a No. 67 Royal steam heater. Next comes a line of three sizes of small hot water heaters for use in heating tanks for storing hot water in apartment houses. Beside them stand a No. 76 and a No. 87 Royal steam heater, and just beyond the No. 42 Royal hot air furnace is shown with a steel radiator and with a cast iron radiator. The next sample is a No. 132 Royal Victor hot air furnace. On the opposite side of the sample room a No. 36 and No. 46 Royal hot water heater are displayed, and beyond them is an assortment of various styles of radiators, and opposite to the Royal hot air furnaces are two Royal kitchen ranges.

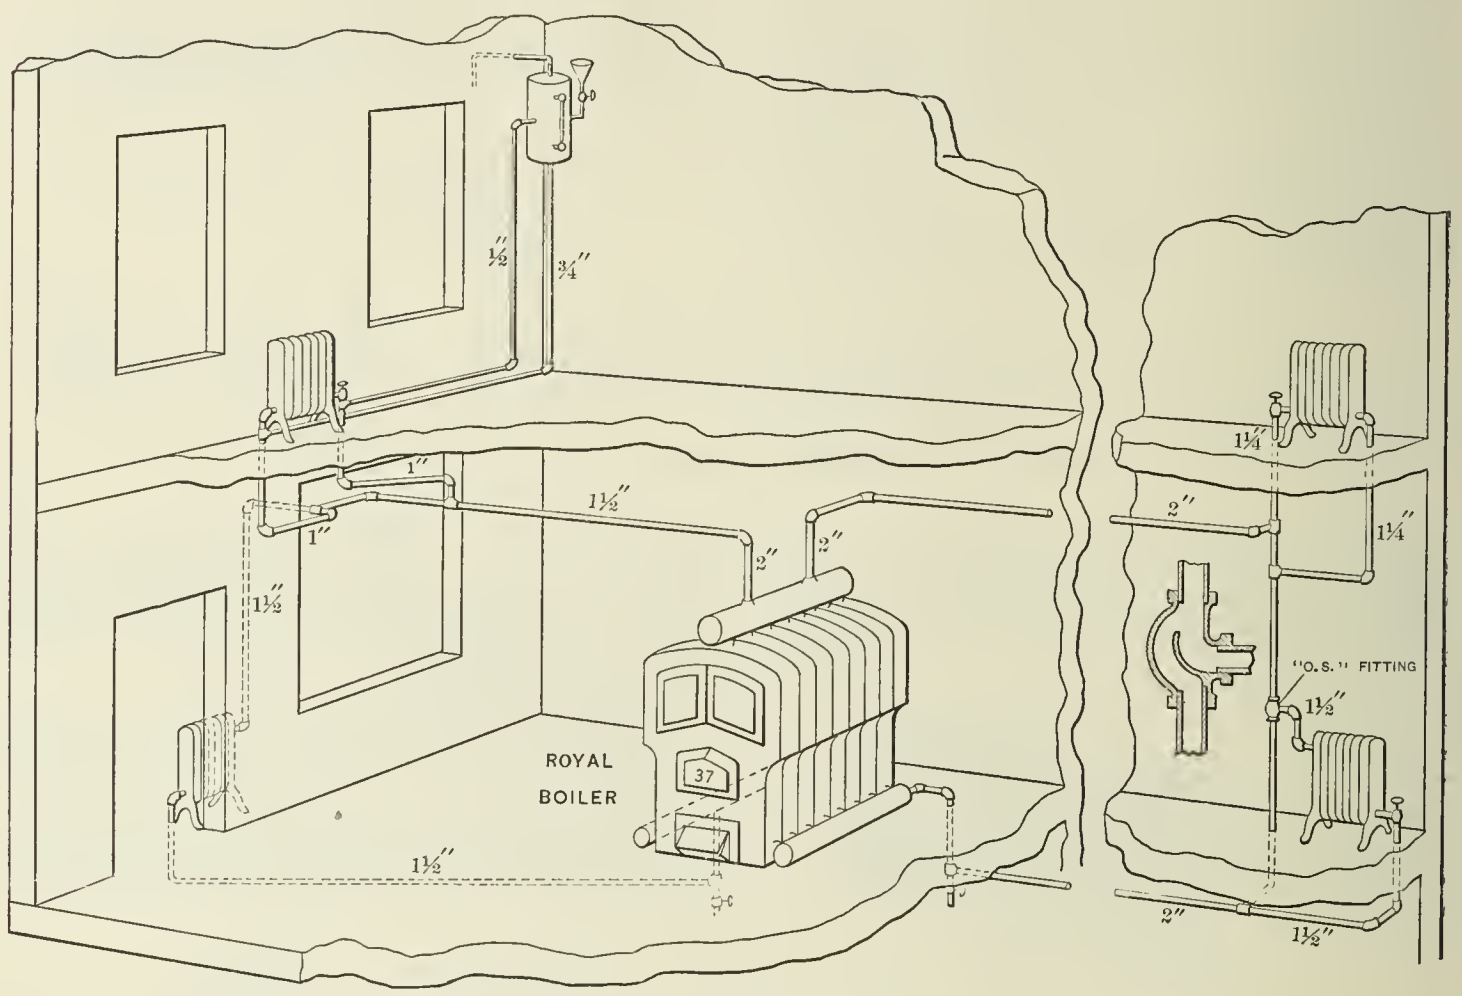

Fig. 3.—View of Boiler and Piping.

The Judson A. Goodrich Company, 120 Beekman street, New York City, are preparing for their representatives a welcome among the trade by the Thanksgiving wishes which are being sent out on a cardboard folder on which are the words "Thanksgiving, 1897," beneath which are the words "We wish thee well." At one end is a picture of a fine fat gobbler, and secured to the card by means of a red ribbon is a wish bone. The inside pages show in a tint a primitive fire place and a country residence. In heavy type are various reasons why thanks should be given, and a request that those who receive the folder should wish for the continued prosperity of the Judson A. Goodrich Company. The last page gives the address of the house and their trade-mark, referring to High Grade Steam Specialties. The folder is incased in a red covering on which reference is made to the house being an authority on High Grade Steam Specialties.

Method of Heating Buildings Where Three or More Stoves Are Now Used.*

Early in the year a circular was sent to the members of the association asking their views on this subject. A number of replies were received, some of which explain the views of the writers so explicitly that we have concluded to give them in full as written. Your committee has been surprised at the view taken by a large number of the members of the circulars sent out by the committee.

George W. Andrews of the Baltimore & Ohio Railroad writes as follows :

" Herewith you will find statement of various methods in use on this road for heating stations. In the small stations we use a No. 2 Alaska stove, at a cost of about $12 set up. In medium size stations we have hot air heaters, which, while they give ample heat, are expensive to maintain. In large stations we have either steam or hot water. The steam is supplied by low pressure steam boilers. In the station at Wilmington, Del., where hot water is used, we have the Perfect hot water heater, made by Richardson & Boynton Company of New York. For economy and general satisfaction I prefer the hot water system. The heater spoken of has been in use about eight years, and has not only given entire satisfaction, but has cost but little for maintenance. We wash it out every spring after fire has been drawn for the season, which is about the only work we have ever done to it. I am aware that many systems of hot water heating have been unsuccessful in the past, which I believe was due entirely to ignorance of the proper application of the principles governing hot water circulation. In the above mentioned heater, as with many others now on the market, due regard has been given to these principles and success has followed. These heaters occupy but little space, and the one we have uses about two tons of coal per month and will heat 40,000 cubic feet of air space."

J. P. Snow, Bridge Engineer of the Boston & Maine Railroad writes as follows :

" The system of heating universally adopted on the B. & M. R. R. is the two-pipe hot water system. For the station at Richmond, Ky., to which you call attention, I would recommend a cast iron boiler of the Richmond, Gurney or Hub patterns, of proper size, placed in a cellar, and radiators giving a surface of about 1 foot to each 35 cubic feet of space in the three waiting rooms shown and in the toilet room and agent's office.

" I would distribute these radiators as well as possible around the room, placing them under the windows wherever practicable. In the baggage room I would run coils, giving about 1 square foot of radiation to 60 cubic feet of space. I would use Detroit radiators having valves and fittings of not less than the following sizes : 1 inch supply and return for radiators up to 40 square feet, 1¼ inch supply and return for radiators from 40 to 60 square feet, 1½ inch supply and return for radiators from 60 square feet upward. I would use flow and return pipes, giving 1 square inch of section to 60 square feet of radiation supplied. I would use an open expansion tank placed above the ceiling, automatically supplied if there is a water service convenient. I would also run a feed pipe to the lowest part of the boiler for filling the system whenever it is emptied. If there is no water supply convenient the tank should be placed as high as possible, but in a position where it can be easily filled by buckets. The above amount of radiation is largely guesswork, as I am not acquainted with the conditions of climate in the latitude specified. In central New England, or at latitude 42 degrees 30 minutes, we use a ratio of 1 foot of radiation to 30 cubic feet of space in waiting rooms and ticket office, and 1 foot to 50 in baggage and express rooms. Further north, or in latitude 44, we use 1 foot of radiation to 25 in waiting rooms.

" Where the radiation is as much as 2000 square feet I should recommend a wrought iron boiler of the Star pattern instead of the cast iron styles specified above.

" The hot water system is expensive in the matter of radiators when first put in, but it is quite economical in coal in moderate weather.

" In the coldest weather the amount of coal used is the same as it would be with steam, but at moderate temperatures, which obtain at least three quarters of the time during which a fire is needed, the hot water system takes decidedly less coal.

" What is known as the Paul vacuum system is, I think, very good for depot heating, although it has not been adopted on our road. It is possible that it may require a little more attention than the system described above. It is essentially a steam plant with a small vapor pipe leading from each radiator or set of coils to an ejector operated by the water supply or some other force which will tend to produce a vacuum. This can be adjusted to work at any desired pressure and its operation is wholly automatic. It is possible to lift vapor from the boiler, which will, of course, give off heat from the radiators when the water is at a temperature of not more than 160 degrees in the boiler. It is then a mere matter of firing to obtain any heat required—the plant being supplied, of course, with a safety valve set to blow at any desired pressure ; the safety valve then governs the upper range of temperature and the vacuum ejector the lower range.

" With the hot water system it is entirely feasible to put on a pressure valve so that it can be run up to any desired temperature. This, however, is not advisable, it being better to put in more radiating surface, allowing the use of a slower fire.

" If I did not want a boiler inclosed with brick and wished to burn coal, wood or coke, the Bromich No. 5 boiler gives very good satisfaction.

" Diameter of boiler, 43 inches ; hight of boiler, 84 inches ; diameter of fire box, 33 inches ; number of 2-inch flues, 210 ; square feet of boiler surface, 185 ; square feet of direct radiating surface, from 1400 to 1900 ; cost, $275 for the boiler.

" I would locate the boiler in the basement, under the baggage room, allowing for space underneath platform for unloading coal and for storage, placing a coal hole in the platform for unloading coal and removing the ashes from the boiler when necessary.

" I would place standard vertical radiators in the ticket office, colored waiting room, and baggage room; also circular radiators in the ladies' and gentlemen's waiting room ; all radiators to have sufficient heating surface for heating each room, located as marked on plan.

" For economy, I would recommend this system. I think you can get more heat from the same amount of fuel. For comfort, you have a steady heat ; for cleanliness, steam heat is far superior, as the boiler is located in the basement ; you do not have coal hods, pokers, tongs and coal shovels to handle ; no stove pipe to take down and clean out ; no stove or stove pipe to polish up ; no coal to carry as when you use stoves."

The following would answer for a general specification for heating this building by steam :

The entire building to be completely warmed by direct radiation, located in the waiting rooms, office, toilet and baggage rooms, connected to a system of steam mains which will be suspended from the ceiling of the cellar.

The main to be connected to a boiler which is to be located in the cellar close to the vertical flue. The steam supply branches to the radiators are to rise to and through the floor and to connect with each of the radiators, inserting in the connection, close to the radiators, a lock shield stop valve, for the purpose of controlling each individual radiator.

The return pipe is to follow the same general direction as that of the steam, and it is to be located on the side wall of cellar near the floor, substantially supported. Branch vertical returns are to connect to each radiator and are also to be provided with stop valves in a similar manner to that described for the steam branches.

To furnish and erect a boiler of any well-known make, such as Toulmin, Gurney or any other equally good pattern, and is to be of ample size to heat the building, in the coldest of weather without forcing.

The boiler to be provided and equipped with the usual set of fixtures, such as steam gauges, try cocks, safety valve, damper regulator, fire tools and all other necessary fixtures to render it complete and ready for steam.

The boiler to be covered in a proper manner with asbestos plaster at least 1½ inches thick, applied over wire mesh.

The boiler to be connected to the vertical chimney by means of a heavy wrought iron smoke pipe, with a pivoted damper in its connection.

To have radiators, located throughout the building, to be of the sectional type, of an ornamental and neat finish. Each radiator to be provided with an automatic air valve of the Onderdonk or Jenkins Bros. patent. They should be distributed as follows : Ladies' waiting room, laides' toilet, small waiting room, office, gentlemen's waiting room, baggage room.

The above radiators are to be of ample capacity to warm the rooms in which they are located to 70 degrees in the coldest winter weather.

After steam has been put on, all of the radiators and exposed piping throughout the building to be neatly bronzed with the best gold or silver bronze color, over a good sound coat of sizing. All the exposed iron work around the boiler and in the cellar to be painted with black asphaltum varnish.

The above represents a complete steam heating apparatus left in perfect running order, with steam on, and would cost in the vicinity of New York about $328.

For the heating of this building by hot water, using the same number of radiators, locating the boiler in the same position, running the pipes in the same general manner as specified for steam, equipping the radiators with valves, &c., including the same guarantee of temperature, &c., would cost about $379.

* Extract of a report by a committee consisting of J. H. Cummin, G. W. Hinman, G. W. Markley, Wm Berry, read before the Association of Railway Superintendents of Bridges and Buildings, at Denver, Colo., October 19-21, 1897.

The approximate amount of coal that would be consumed in the steam heating apparatus would be about 13 tons for a winter of six months, and with careful management the hot water system would consume 10 tons of coal for the same period. This amount would in all probability be reduced if the caretaker of the boiler was careful.

Steam Fitting at the Trade School.

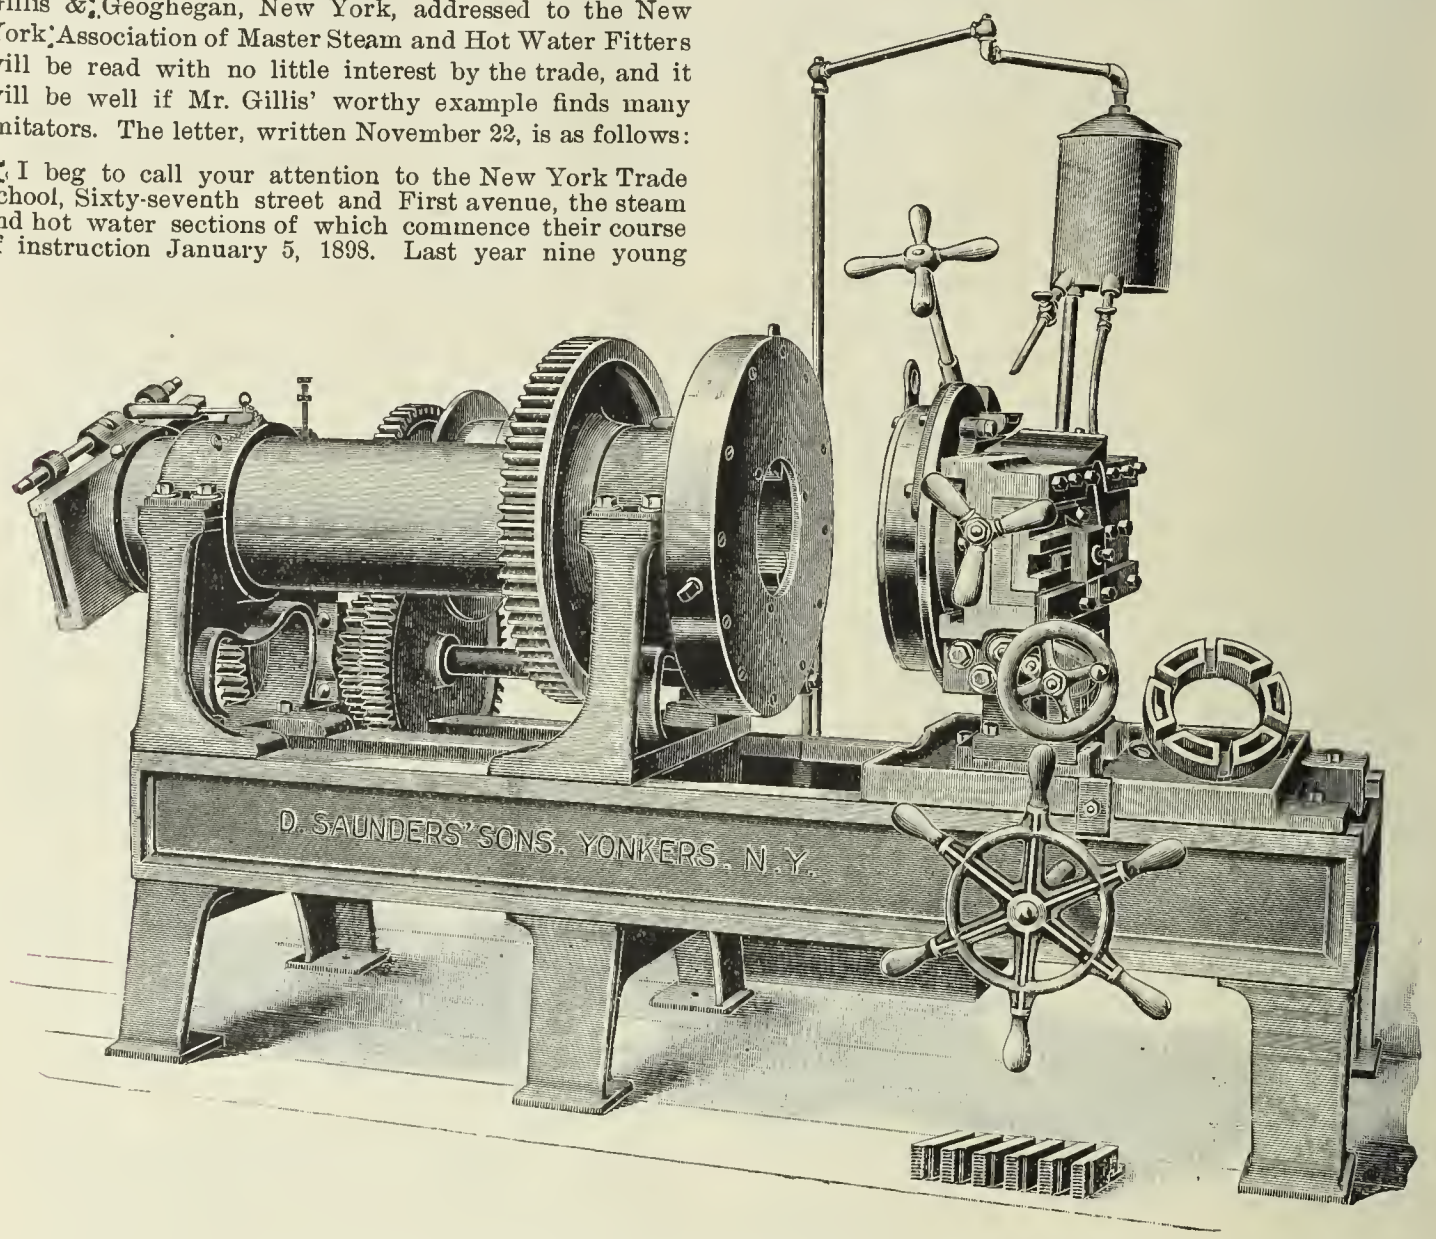
The steam fitting class at the New York Trade School has been a marked success, and it is pleasing to learn that still greater interest is taken in it each succeeding year. It is especially gratifying to note the attention given by some of the prominent men in the trade, and we believe the following letter from Charles J. Gillis of the firm of Gillis & Geoghegan, New York, addressed to the New York Association of Master Steam and Hot Water Fitters will be read with no little interest by the trade, and it will be well if Mr. Gillis' worthy example finds many imitators. The letter, written November 22, is as follows:

"I beg to call your attention to the New York Trade School, Sixty-seventh street and First avenue, the steam and hot water sections of which commence their course of instruction January 5, 1898. Last year nine young men graduated from the class of steam and hot water, six of whom have been heard from and have been at work, for outside of New York and Chicago a graduate can obtain work. I consider the preliminary education obtained in this school to be of such importance that I have agreed to pay the cost of keeping five students there the coming season at $40 each, selecting young men who cannot pay themselves. It is possible the association may think it in their power and desire to found similar scholarships, or that individual members may wish to do it. Mr. Walworth of Boston and Mr. Franklin have consulted me about sending their sons to join the class this season, and Mr. Geoghegan has recorded the name of one of his sons for the same. I should be glad to see 50 or 100 members of the new class, as such a number can be readily accommodated in the splendid buildings of the institution and take advantage of the technical education they will receive.

The above letter was read to the Master Steam Fitters at their regular meeting this week, and the association voted that a gold medal be given to the graduate having the best record at the coming session of the Trade School in the steam heating section.

The Saunders Pipe Threading and Cutting Machine.

The belting and gearing of the pipe threading and cutting machine here illustrated have been arranged with the view of obtaining suitable power and speed for the various sizes of pipe, so proportioned as to give a nearly uniform surface speed for each of the different sizes of pipe. The power of the machine is in the arrangement of the gearing, avoiding the necessity of using large pulleys and tight belts—a difficulty common in such machines. Besides the variations of speed obtained by the cone pulleys, the gearing, which is changed by the movement of a lever, will give the additional speeds and power required for the sizes to be cut. There are no loose gears—all remain on the machine. The cutting head on the carriage is arranged with the die head on front, sliding in ways,



The Saunders Pipe Threading and Cutting Machine—Fig 1.—Front View

which allows the die head to be brought close to the gripping chuck. By this means short pieces of pipe can be threaded without the use of a nipple chuck. After the pipe has been threaded, and to be moved to adjust it for cutting off, or for any other reason, the die head is pushed to one side, allowing the pipe ample room to pass through the cutting head without passing through the die head, to the injury of the chasers by the pipe sliding over them, which is the case when the die head is held stationary in center of ways of the machine. By this arrangement pipe is alternately threaded and cut off without removing the die head from the machine. The cutting off tool is conveniently placed.

The hardened steel V jaws, for steadying the pipe while cutting it off, are moved by a right and left hand screw, thereby centering the pipe. The jaws are adjustable, to compensate for wear. The gripping chuck for holding the pipe is strong and well fitted, provided with independent jaws, permitting of the adjustment of the pipe to the center, and avoiding a common difficulty in the ordinary pipe chuck after it has been used some time. When desired a universal gripping chuck is fitted to the machine in the place of the independent. At the rear end of the spindle is a two-jawed self centering chuck to center the pipe, doing away with bushings or guides.

The die heads are of the adjustable expanding style, cam movement, operated by means of a worm and wheel, releasing the pipe at once when the required thread has been cut, and without stopping or reversing the machine spindle. With the No. 6 machine there is one die head, with a number of sets of chasers, all fitting into the same,

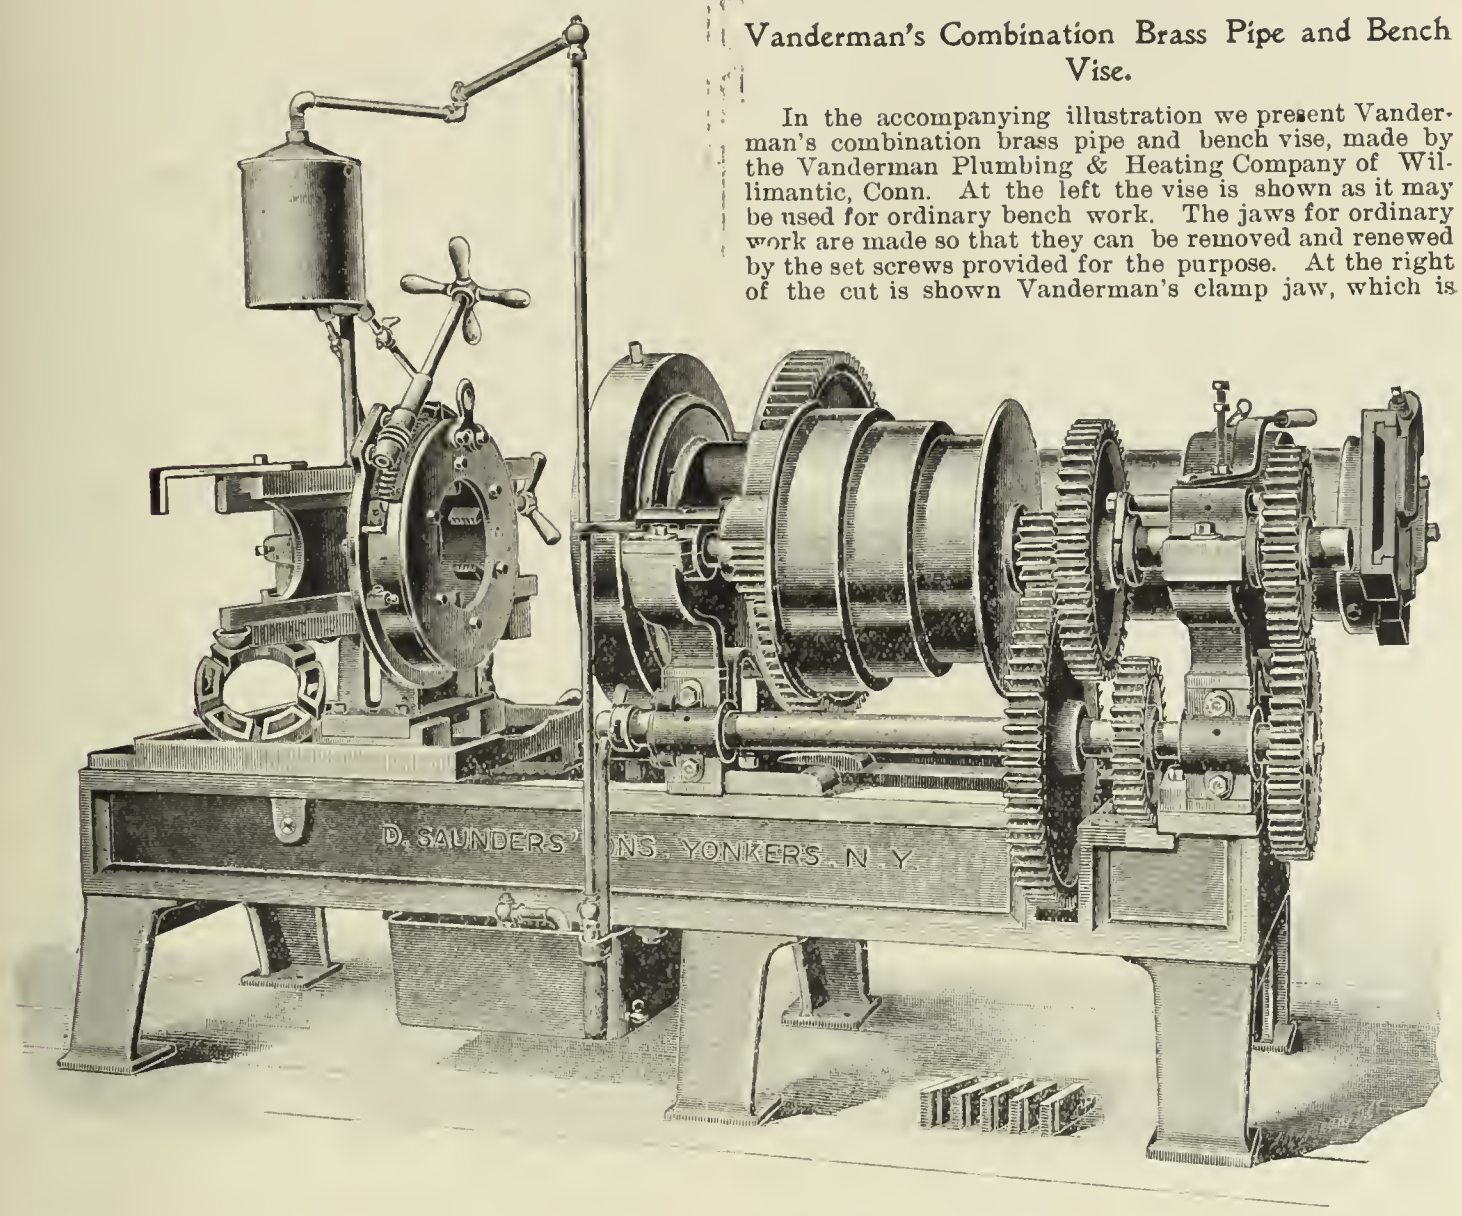


Fig. 2.—Back View.

to thread 2½ to 8 inches, with a set of blank gauges to set chasers to for the different sizes. The No. 5 machine has two die heads, one threading 1¼ to 2 inches, the other 2½ to 6 inches. By having two there is less changing of the chasers, loss of time in changing, and less cost for extra chasers for the small sizes. When the small die head is used the large one is pushed to one side, allowing ample room for the small die head to be brought to the center. The large die head remains on the machine. An automatic oil pump is attached to supply a constant flow of oil to the chasers and cutting off tools. Each machine is fully tested before leaving the works of the manufacturers, D. Saunders' Sons, Yonkers, N. Y.

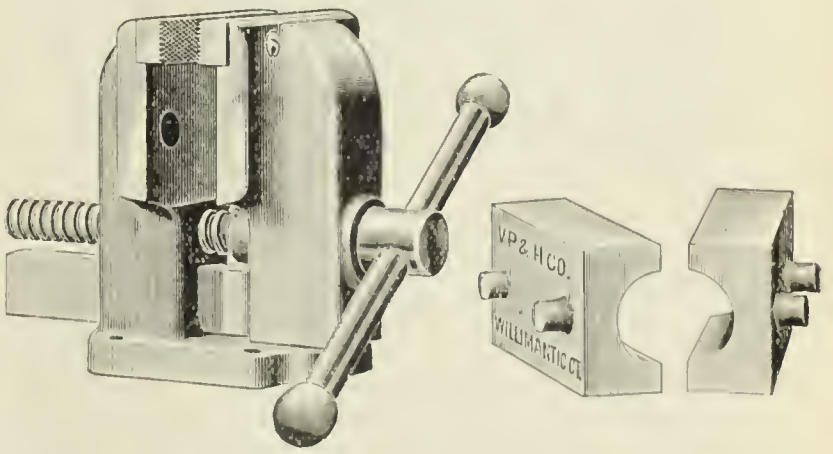
Plumbing and Steam Goods.

A large meeting of plumbing and steam goods manufacturers was held at the United States Hotel, on Fulton street, New York, on Tuesday morning to consider the proposition for better trade protection made at the conference meeting of master plumbers, master steam fitters and manufacturers at the Hotel Windsor last week. After due consideration of the proposition the sense of the meeting expressed in a vote was that it was unnecessary to enter into any new agreement, as they were in accord with the existing resolutions for trade protection.

Sir Henry Doulton, the head of the firm of Doulton & Co. of the Lambeth Pottery Works, London, England, who died last week, is claimed as the pioneer maker of sanitary ware, which he initiated in 1846. He was 77 years of age at the time of his death and began to work as an operative potter at the age of 15. Besides the famous Lambeth potteries, he conducted similar establishments at Burslem, Rowley Regis and Smithwick, in Staffordshire, and at St. Helen's, in Lancashire, and was head of the Sanitary Engineering Works, at Lambeth, England; Paisley, Scotland, and Paris, France. In the course of his career Sir Henry Doulton received 105 gold medals and diplomas and 102 silver medals.

Vanderman's Combination Brass Pipe and Bench Vise.

In the accompanying illustration we present Vanderman's combination brass pipe and bench vise, made by the Vanderman Plumbing & Heating Company of Willimantic, Conn. At the left the vise is shown as it may be used for ordinary bench work. The jaws for ordinary work are made so that they can be removed and renewed by the set screws provided for the purpose. At the right of the cut is shown Vanderman's clamp jaw, which is especially adapted for holding polished brass or nickel plated pipe so that it can be threaded and cut without the pipe lipping and being scarred. Different sizes of clamp jaws are made for the different sizes of pipe, and are provided with lugs for putting in the openings shown in the vise jaws, so that they are held securely in place. They can be readily removed from the vise for inserting another size of jaws or when the vise is to be used for ordinary bench work. The jaws are so cut that they can



Vanderman's Combination Brass Pipe and Bench Vise.

be used for holding ordinary iron pipe without marking the face which comes in contact with brass pipe, and having jaws 5 inches long the bearing for holding the iron pipe makes them efficient in use. A pipe vise of this character will be found of great convenience to plumbers who do both iron and brass pipe work.

Palace King and Queen Heaters.

March R. Story & Sons, 121 Lake street, Chicago, are furnishing two huge warm air furnaces of the Palace King type, built by Russel Wheeler & Son, to the Sixth United Presbyterian Church, Sixty-second street and Woodlawn avenue, Chicago. These furnaces have a 36-inch fire pot, 61-inch radiator and 68-inch casing. The method pursued in heating and ventilating this church is of consider able interest, and we hope to lay the details before our readers in a few weeks. In the shop of Story & Sons a sample has just been placed of the new Palace Queen hot water boiler brought out by Russel Wheeler & Son. Its merits are enthusiastically set forth by C. B. Madison, who represents Russel Wheeler & Son, in the West. It is composed of upright sections, each being independently connected with the flow pipe at the top and the return at the bottom, so that not only can more sections easily be added, but in case of the breakage of one section it can be taken out and replaced without interfering with the operation of the heater. The sections are so built that the flame and products of combustion are drawn to the front of the heater, thence by a port back through a flue made by the tops of the sections, forward again, and back to the smoke pipe, which exhausts the heat thoroughly. A special device is arranged for checking the draft. All the fittings are of the best character. The heater is unusually heavy, so as to insure durability. It is made in a full range of sizes. The same construction is also adapted to steam heating and covers a wide range of sizes.

NOTES.

Higham Bros., Salt Lake City, Utah, bid $1750 and secured the contract for plumbing the county infirmary.

John Hunter, a prominent plumber of Halifax, Nova Scotia, died last week.

Patterson, Gottfried & Hunter, dealers in Machinery, Hardware, Tools and Supplies, 146-150 Centre street, New York, are sending to the trade a puzzle card in the interest of the Fairbanks-Morse Gas Engines. "Is marriage a failure?" is the problem presented for solution, with a group of the fair sex at one side and of the unfair at the other, with intricate paths leading to each, and following the circuitous windings to the end the seeker is liable to a surprise.

The firm of John Getz's Sons, York, Pa., are doing the plumbing work in the Young Men's Christian Association gymnasium. It includes two Combination Shower and Needle Baths.

L. L. Lord, 934 Market street, Meadville, Pa., brings to our notice a circular showing the Lord Taper Reamers, designed for making smooth true holes in stoves, bathtubs and cast iron pipes. The Reamers are made in several different sizes, for making holes ¼ inch in diameter up to 1½ inches.

Thomas Hyde of Albany, N. Y., has been granted permits by the Board of Health to place a new system of plumbing ventilation in a house which he is building.

The Council Committee appointed to hear the charges against Plumbing Inspector Kendrick of Birmingham, Ala., have made a report, which was adopted, stating that the charge of incompetency was totally disproved and the charge of partiality was not sustained.

J. E. Neff of Washington, Pa., is doing a fine job of plumbing in a handsome new residence for Dr. J. S. McCartney.

Allen S. Flitcroft, Ocean Grove, N. J., is one of the busy plumbers at the present time. He has the contract for plumbing the new High School at Ocean Grove, plumbing and tinning a new hotel at Allenhurst, tinning and copper work on a new summer home for James Moses at Spring Lake, besides a number of other heating and plumbing contracts, among which is one for placing a 60-inch Thatcher Furnace in the Page cottage at Allenhurst.

In New England the importance of correct plumbing is brought directly to the attention of the housekeepers by lectures on the subject before the women's clubs and is an example that can be followed throughout the country with advantage. Melvin H. Hapgood recently gave a lecture on plumbing to the Motherhood Club of Hartford, Conn., using the blackboard in illustrating the points brought forward. The general lay out of pipes, vents, inlets and other features of plumbing work in a house was described and sections showing good and bad forms of traps and wastes in water closets, bowls and bathtubs were likewise drawn. Mr. Hapgood strongly recommended the placing of soil and other pipes in sight rather than behind boards or plastering, and gave much other excellent advice.

Albert Brass Works of Brooklyn have been incorporated to manufacture Plumbers' and Steam Fitters' Specialties, with a capital of $10,000. The directors are Charles Steinberg, Minnie Steinberg, Samuel Wasserman of New York City and Thomas C. Roberts Horsfield of Brooklyn.

Articles for incorporation of the Alaska Thawing & Heating Company have been filed at Portland, Ore. The incorporators are Harry K. Greenleaf, Charles E. Potter and John C. Hollister. The company have a capital stock of $25,000.

The Plumbers' Metallic Joint Company have been organized at Portland, Maine, for the purpose of manufacturing and dealing in Pipe Couplings and Plumbers' Supplies. The incorporators are Morris Ebason, Salem, Mass., president, and Thomas Davey of Lynn, Mass., treasurer.

James Hewson will move his plumbing establishment to a store in the new Langbehn Building, on Fifteenth street, Moline, Ill.

E. E. Horton, one of the representatives of the Thatcher Furnace Company, New York, informs us that Thomas Pierce, Canton, Pa., has contracted to heat the residence of M. Landon with an Empire Steam Heater.

The plumbers of Lansing, Mich., have been notified by the Water Commission that no permits will be issued hereafter to plumbers who have not yet taken out a license.

O'Neill & Blackall, plumbers and Stove dealers, at Montpelier, Vt., have dissolved partnership. Mr. O'Neill will continue in the plumbing business and their stock of Stoves has been purchased by George H. Whitney.

James Tate, Mansfield, Ohio, bid $1000 and secured the contract to heat the Deal House, at Bucyrus, by steam.

Fryer & Bathazar, 143 Centre street, New York, are meeting with a good demand for their Simplex Valve for hot water heating, which saves the fitter considerable time and material.

A. H. Meal has been granted a plumbers' license at Guthrie, Okla.

Charles Kieser is about to open a plumbing shop in Newtonville, Mass.

The Richmond Stove Company, 85 Centre street, New York, have just completed a rearrangement of the samples in their showroom. They have added one of the largest size Sectional Steam Heaters, which has a fire chamber 36 inches wide. These sample boilers are all painted sage green, while the new 0 and 900 series of Water and Steam Heaters are painted a bright red.

Contracts for the erection of the central heating plant of the Northern Asylum, at Newberry, Mich., have been awarded to the L. J. Mueller Furnace Company of Milwaukee for $13,225.

F. Bailey and Floyd Kemp have lately opened up in the retail Hardware, Builders' Supply and Plumbing business at Trenton, Mich. The style of the new firm is F. Bailey & Co.

The Secretary of the Treasury has advised collectors of customs at ports in the United States where works of manufacturers engaged in the smelting or refining of metals from imported ores are bonded, that as the tariff act of July, 1897, differs from the act of 1894 it is deemed advisable to require the rebonding of such works. Under the Wilson law it was provided that each day a quantity of refined metal equal to the amount of imported metal smelted or refined that day should be set apart and should not be removed from the works except for transportation to other bonded premises or for exportation. Under the new law it is provided that a quantity of the refined metal equal to 90 per cent. of the amount of imported metal smelted or refined shall be set aside each day. In the new tariff it is required that lead ores imported and refined shall either be exported or entered for consumption within six months from the date of the receipt of the ore. Under the old regulations no limit of time was fixed.

A correspondent at San Francisco, Cal., writes: "The Klondike fever is epidemic now in San Francisco and the coast generally. Estimates of the number of people who will find their way there in the spring vary all the way from 50,000 to 200,000, but your correspondent goes below low water mark even and places it at 30,000. This will give rise to a great trade, and it is safe to say that $30,000,000 will be spent. San Francisco merchants are taking steps to see that the major part of it comes their way. The time that it takes a vessel to get from San Francisco to St. Michaels at the mouth of the Yukon is almost exactly the same as from Seattle, our great rival. There will be a great trade with the North here next year, and a large portion will consist of Hardware, Machinery and Iron utensils of all descriptions, Picks, Shovels and the thousand and one little odds and ends which are necessary even in a mining camp."

TIN PLATES.

Tin Plate in Pennsylvania.

We are indebted to James M. Clark, Chief of the Bureau of Industrial Statistics, for a copy of Part Three of the Annual Report of the Secretary of Internal Affairs of Pennsylvania, giving statistics for the year 1896. Considerable prominence is given to the tin plate industry in Pennsylvania, and the analysis at the end of the book presents the following summary of the tin plate figures. The first relates to wages, and is as follows:

There are 303 persons considered, including 14 boys and 8 females. Their average earnings were $669.98. It must be understood that these statistics are taken from black plate works and not from dipping works, but that this average includes the labor in making the plate and in tinning it.

	Average yearly earnings.	Ranging from		Highest monthly earnings.
18 rollers	$1,852.69	$1,387.88 to	$2,802.44	$383.77
6 rollers and doublers	1,350.87	750.13 to	2,198.84	397.08
17 rollers' helpers	560.36	414.52 to	836.98	114.63
22 heaters	1,057.20	472.04 to	1,948.60	234.80
3 pair heaters	254.19	236.09 to	268.20	49.29
19 doublers	1,333.09	660.05 to	1,864.33	258.65
6 annealers	688.68	320.27 to	1,259.00	140.00
6 annealers' helpers	397.12	247.41 to	564.80	50.50
8 assorters (females)	198.43	119.02 to	245.50	26.00
6 wet loaders	329.09	217.89 to	384.51	37.00
3 openers	377.92	336 07 to	401.82	46.70
3 W. P. openers	393.32	294.59 to	508.18	64.80
8 shearmen	833.44	372.81 to	1,731.36	302.97
4 riggers and shearmen	488.38	439.80 to	547.67	60.85
8 tin stack workers	600.33	345.71 to	1,020.61	127.90
5 gasmen	729.56	483.15 to	1,140.00	180 00
7 engineers	588.42	429.65 to	686.20	76 50
5 firemen	444.26	341.55 to	503.78	47.90
4 machinists	738.28	621.00 to	814 33	82.81
3 coal heavers	473.44	403.31 to	533.97	54.90
13 laborers	383.33	215.57 to	590.09	83.75

One "cold rolls" is found to have had earnings of $1167.80; highest monthly earnings, $112.50. Two blacksmiths earned, respectively, $519.34 and $765.25, with daily wage of $1.75 and $2.50.

The second section in the analysis relating to tin plates gives statistics of production, and is presented in full here with:

It will be noticed in the black plate works that 12 establishments are considered, and that they cover the entire production of black plate in Pennsylvania for 1896, with the exception of 100 tons for which no statistical return was made. Including this 100 tons the total production of black plate for 1896 was 158,306,490 pounds, as against 104,757,360 pounds produced in 1895, an increase of 53,549,130 pounds, or over 50 per cent. Of this production 97,814,762 pounds was tinned, as against 49,502,000 pounds tinned in 1895, or nearly double the quantity. The value of the entire production tinned and untinned in 1896 was $4,633,161, as against $3,252,924 in 1895. The average value of the tinned production in 1896 was $64.56 per net ton, and for the black plate untinned, $48.94. There were 3144 persons employed, as against 2474 employed in 1895, with an average number of days of employment of 254, as against 229 in 1895; average yearly earnings, $456.55, as against $429.95 in 1895; average daily wage, $1.80, as against $1.87 in 1895.

The number of dipping plants in operation was 3 less than in 1895, there being but 14 in 1896, and there being 17 in 1895; number of persons employed, 477, as against 557 in 1895; number of days in operation, 240, as against 244 in 1895; average yearly earnings, $281.63, as against $337.92 in 1895; average daily wage, $1.17, as against $1.38 in 1895. Their total production of tin plate was 41,773,941 pounds, as against 54,873,636 pounds produced in 1895, a decreae of 13,099,695 pounds, or nearly 24 per cent. Value was $1,888,398, as against $2,463,494 in 1895, a decrease of $575,096.

The black plate and dipping works combined had a total product of tin and terne plate of 139,588,703 pounds, or a total production, including the 60,491,728 pounds black plate not tinned, of 200,080,431 pounds, as against 159,630,996 pounds produced in 1895, with a total value of $6,520,559, as against $5,716,418 in 1895.

Pennsylvania still holds her place as the largest single plant producer of tin plate in the world.

The Witte Hardware Company, St. Louis, Mo., are making a specialty of American Tin Plate, which they are handling in large volume. The brands of Bright Tin, specially manufactured for the concern and handled by them, are Juno and Hero. Ajax and Hercules are the names of the company's special brands of Roofing Tin.

SCRAP.

Harry Herbert has assumed the position of manager of the new tin mills of the Neshannock Sheet & Tin Plate Company, New Castle, Pa. Mr. Herbert was the first superintendent of the New Castle Sheet & Tin Plate Company's plant, but resigned to accept a position at Montpelier, Ind. Of late he has been manager of a large Tin Plate plant in Ohio, which position he has relinquished to take charge of the Neshannock plant. Before leaving his last berth he was presented with a handsome gold headed cane and a silver match box from the employees of the mill. Mr. Herbert has had a large experience in building tin mills and getting them into working order.

The first seizure of contraband Tin Plate since the industry was established in the United States was made last week at Passamaquoddy, Maine, by the special Treasury agent of that district. It consisted of 20 boxes, which were seized, together with the schooner which conveyed the goods from St. John, N. B. The boat and the Tin Plate will be sold to the highest bidder, in accordance with the law.

We are advised by the Humbert Tin Plate Company, Connellsville, Pa., that they have leased the Tin Plate plant of the Stickney Iron Company, Baltimore, Md., and will operate the same under the name of the Humbert Tin Plate Company. Their output will consist of Coke Tin Plates under the brand name of Humbert.

A little 16-page pamphlet distributed by the E. E. Souther Iron Company, St. Louis, Mo., is devoted to their special brands of Bright and Terne Plates. These are: Calla Lily, Daisy and Honeysuckle, Bright Plates, and Black Hawk, Buffalo and Arrow, Ternes. All these Plates are made of best American steel and coated by the palm oil process. A description of the method of tinning by the oil process is given, and also of the acid tinning process, showing the advantages of the former over the latter. The pamphlet also contains price-lists and descriptions of the company's Tin Flashings, Tin Valleys and Gutters, Stove Pipe Stock, One-Piece Corrugated Elbows, Peerless Adjustable Elbows, and Samson's Four-Pieced Elbows, as well as Reliable Peerless Stove Pipe.

A San Francisco, Cal., correspondent writes under date of November 8: "We have been receiving Tin Plate during the fortnight, though not in any very large quantity. We had, however, five cars, or 169,170 pounds. Of course this is not the season and the only effect of the importations is to add to the stock in hand."

Some samples of American M. F. Terne Plates, made at the works of the Ellwood Tin Plate Company, Ellwood City, Pa., were to be seen this week in the office of a New York City jobbing house. The Plates were critically inspected and tested by a number of handlers and consumers of the Welsh M. F. Plates and were generally admitted to be fully up to the standard of that famous brand of Roofing Tin. The only difference seemed to be that the coating of the American product is somewhat smoother than the Welsh. The Ellwood Tin Plate Company are said to be well furnished with orders for M. F. Plates for near and future delivery.

A considerable increase in the capital stock of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., will be made. As already noted, this concern at present have some very extensive additions to their plant under way.

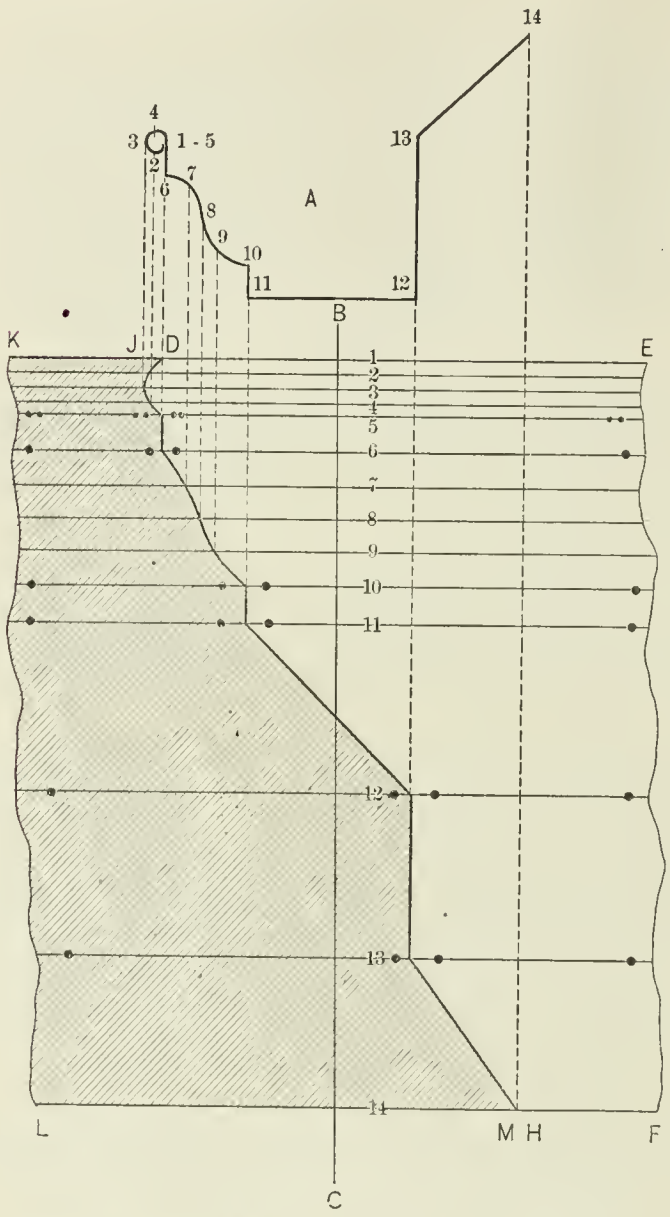
Samuel Trethewey & Co., Limited, Pittsburgh, Pa., manufacturers of Solid Steel Shear Knives and Rolling Mill Machinery, are adding considerable machinery to their equipment to meet the demands of their growing business. This concern are running their works full time, and have recently made several shipments of Rolls to England.

The Ellwood Tin Plate Company, Ellwood City, Pa., have added considerable machinery to their equipment to accommodate the additional demand for their Plate caused by the acquisition of MF brand of roofing Tin. At the present time they have formed no definite plans for further extensions.

SHEET METAL WORK.

Outside and Inside Miters.

A correspondent in Sedalia, Mo., asks us to inform him through *The Metal Worker* how to draw outside and inside miters for hanging gutter.



Outside and Inside Miters.—Fig. 1—Section and Patterns.

Let A in Fig. 1 represent any section of a hanging gutter. Divide the profile, including the bead, into any convenient number of equal spaces. At right angles to 11 12 draw a vertical line, B C, upon which place the stretchout of the hanging gutter, as shown by the small figures. At right angles to B C, and through the small figures, draw lines which intersect with those of corresponding numbers drawn from the spaces in the profile A at right angles to 11 12. Trace a line through the points of intersection thus obtained, as shown by D H. Then will D E F H represent an outside miter for an exterior or outside angle, shown in Fig. 2 by A B, and the reverse or shaded portion, J K L M, in Fig. 1, an inside miter for an interior or inside angle, shown by C D of Fig. 2. No matter what outside miter is obtained at any angle, the reverse, or that portion of the miter falling off, is always the inside miter at the same angle.

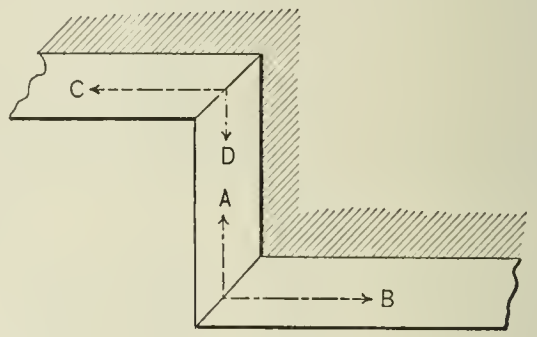


Fig. 2.—Diagram Showing Outside and Inside Miters.

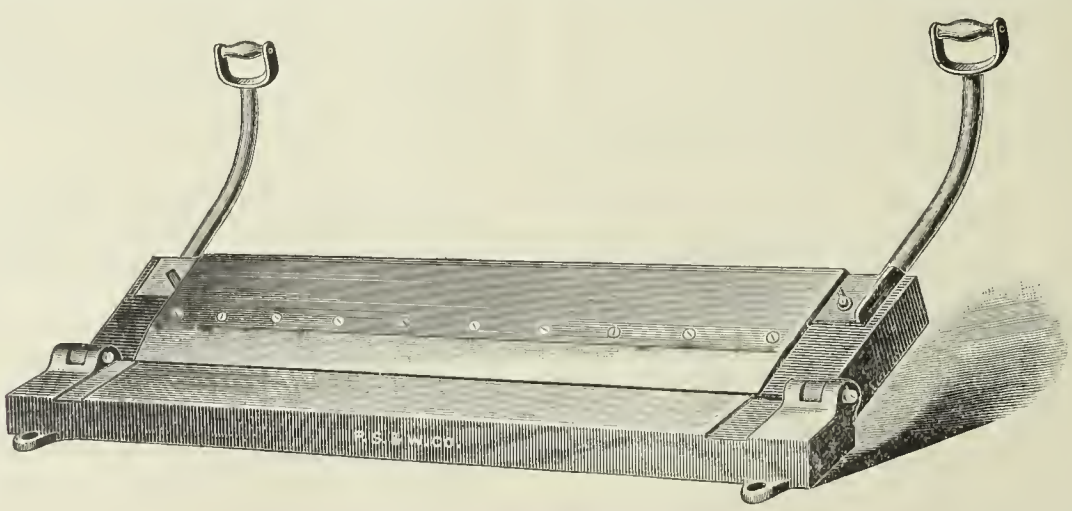
Stow's Improved Sheet Iron Folder.

The Peck, Stow & Wilcox Company, 27 Chambers street, New York, have put upon the market an improved form of Stow's sheet iron folder for heavy work, as here illustrated. There is a handle at each end and a gauge for regulating the width of lock from ¼ to 2¼ inches inclusive. Any suitable angle can be formed on iron as heavy as 20 gauge, and if necessary machines can be furnished to turn wider locks. They are numbered 25, 30 and 35, with capacities of 42, 48 and 60 inches, the machines weighing 290, 325 and 400 pounds respectively.



Stow's Improved Sheet Iron Folder.

FLASHINGS.

In the report of industrial statistics of the State of Pennsylvania, which we received from James M. Clark, chief of the bureau, giving the statistics for the year 1896, we find the following figures relating to the slate industry. The figures are based on returns from 39 concerns, the total value of their production amounting to $1,491,575, the average number of wage earners being 2923 and the aggregate wages received $867,175, being an average daily wage of $1.27. These figures include roofing slates, school slates and other products.

We are informed by the Burgess Soldering Furnace Company, Columbus, Ohio, that any one having Gem Gasoline Soldering Furnaces that are not up to date can make them so at a small cost by adding their new Generator and Drip Cup, which is said to generate without noise, smoke or odor. To attach the same it is simply necessary to drill two holes below the front resting plate

and bolt the cast iron bracket to it. This improvement can be sent by mail, and all who are interested in it should write to the manufacturers for prices and particulars.

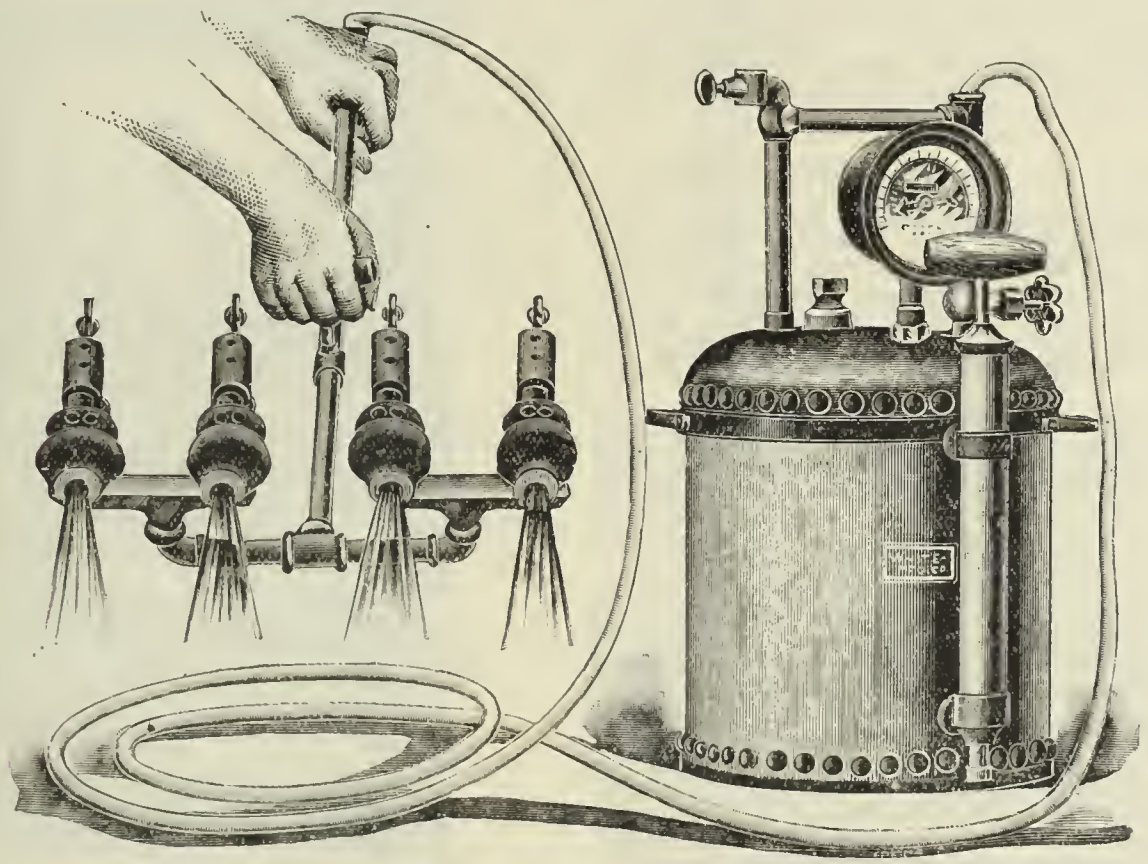
The American Corrugating Company, St. Louis, are meeting with remarkable success in marketing their American Metallic Lath. The points of superiority claimed by this company are stiffness of sheet, economy of plaster, efficiency of key, depth of corrugations, simplicity and speed in working. Their shipments extend to all parts of the country, and they are in receipt of numerous letters of recommendation from the trade and those who have used this lathing.

R M. Clough, who manufactures an extensive line of Shears, Presses, &c., has removed from New Haven, Conn., to Tolland, Conn.

The new co-operative Sheet mill at Scottdale, Pa., will be operated under the name of the Old Meadow Rolling Mill Company.

The Klondike Kerosene Burner.

The special requirements of the Klondike gold fields have called forth new adaptations of apparatus originally designed for other purposes. A curious instance of this is found in the accompanying illustration, which represents



The Klondike Kerosene Burner.

a machine for quickly thawing frozen ground, an operation which is necessary in placer mining in the Arctic regions. Full descriptions of the principle on which this burner is constructed have previously appeared in these columns. It is the invention of John P. Dupee, who has brought out a long line of devices for use in furnaces adapted to the needs of tinners, plumbers, electricians, bicycle makers and other metal workers, all of which are manufactured by the White Mfg. Company, 42 State street Chicago. The Klondike device, although intended for heavy work, is in portable form, so that two men can easily carry it. A galvanized metal tank holds five gallons of oil and is equipped with an air pump and a pressure gauge. A hose connects the tank with the burners, which are four in number, mounted on a frame that can easily be held in the hand and directed at the operator's pleasure, so that the flame can play downward, sidewise or upward as necessary in melting ice, snow or frozen earth. The burners have individual valves, so that they can be run independently. A feature that will be particularly appreciated so far from civilization is that these burners are not likely to get out of order. The generator is not superheated, so that no clogging takes place from carburization. The hose can be furnished in any length desired, but the standard length is 6 feet. The apparatus can be used under a tent or other inclosure instead of the open air. While kerosene is the fuel recommended, gasoline can be burned equally well if more conveniently obtained. A test of this burner has, it is stated, reduced to water in 15 minutes a cake of ice 18 inches square and 10 inches thick. The company have, we are advised, booked some large orders for these burners from Klondike miners.

Only 13 tons of Black Plate were exported from Great Britain to the United States in October last, as against 184 tons in the corresponding month of 1896 and 740 tons in October, 1895. Meanwhile the total British exports of Black Plate have swelled materially. For the first ten months of 1897 they amounted to 50,185 tons, as compared with 41,332 tons in 1896 and 28,376 tons in 1895. This growth, however, seems to have been largely at the expense of the trade in finished Tin Plate, for it is noted that this year's shipments of Black Plate have been largest to the countries—the United States excepted—to which there has been a falling off in the shipments of Tin Plate. Russia, Germany and Italy are all dipping and finishing British Black Plate to a large extent.

Difficulties are being met with in the Welsh Tin Plate trade with regard to the resumption of work by the mills upon the 15 per cent. reduction in wages agreed to by the union. At Llanelly, Briton Ferry and elsewhere the "behinders" and "risers" have declined to accept the lesser reduction of 10 per cent. that had been agreed upon elsewhere, and, while refusing to work, they are attempting to coerce those who have already accepted the terms to break away from their agreement. This is likely, says the *Iron and Coal Trades Review*, to prolong the stoppage of a large number of works, and it is stated that there is an inclination on the part of the men to withdraw from the 15 per cent. reduction. If they persist in this it will mean a general lock out, unless wiser counsels prevail. It was thought that after the Tin Platers' Union had passed a resolution to accept 15 per cent. as a uniform reduction there would be no further demur on the part of the men and no unnecessary cessation of work. The orders for Tin Plates continue to be scarce, and a large number of works are now dependent upon Black Plate and Sheets.

Clarence F. Chatfield, Owego, N. Y., is making a specialty of writing advertisements for manufacturers and dealers, designed especially to fit each individual case according to the data supplied by each client. They may be type matter only or accompanied by illustrations, there being 1000 to choose from. On application suitable literature will be sent quoting rates, &c.

The Michigan Pipe Company, Bay City, Mich., issue a circular calling attention to their wooden pipe for chain pump tubing, also for tanners' and distillers' use, chemical works and casing steam pipes. They are manufacturers of the improved Wyckoff water pipe for distributing water in towns.

THE RETAIL STORE.

Benjamin F. Dunham.

Benjamin F. Dunham, president of the Dunham, Carrigan & Hayden Company, San Francisco, Cal., died in that city November 11. Mr. Dunham was born in Plymouth, Mass., in 1830. He left the old home for Boston, about 1850, and entered the employ of Butler, Keith & Hill, at that time one of the leading hardware houses in New England, and there with hard work and close application he laid the foundation of his later success.

In 1853 he went to California, entering the employ of Hooker & Co., Sacramento, and from there, in December, 1859, to San Francisco, connecting himself with Conroy & O'Connor. In 1872 he was admitted to an interest in the house, together with two of his fellow clerks, Brace Hayden and E. W. Playter, and the firm name changed to Conroy, O'Connor & Co. In 1875 the Conroy & O'Connor interest was sold out to the junior members, including Andrew Carrigan and William McCormick, and the business continued under the name of Dunham, Carrigan & Co. In 1888 the business was incorporated as Dunham, Carrigan & Hayden Company, with Mr. Dunham as president, which position he held until his death.

Sensation in the Chicago Hardware Trade.

The wholesale Hardware firm of John Alling & Co. 53-55 Lake street, who have done business in Chicago under various firm styles since the '50's, have been absorbed by Hibbard, Spencer, Bartlett & Co., who have also done business in Lake street since the '50's. The sale took place nominally on the 12th, but the Alling firm will not be merged into their big rival until December 1.

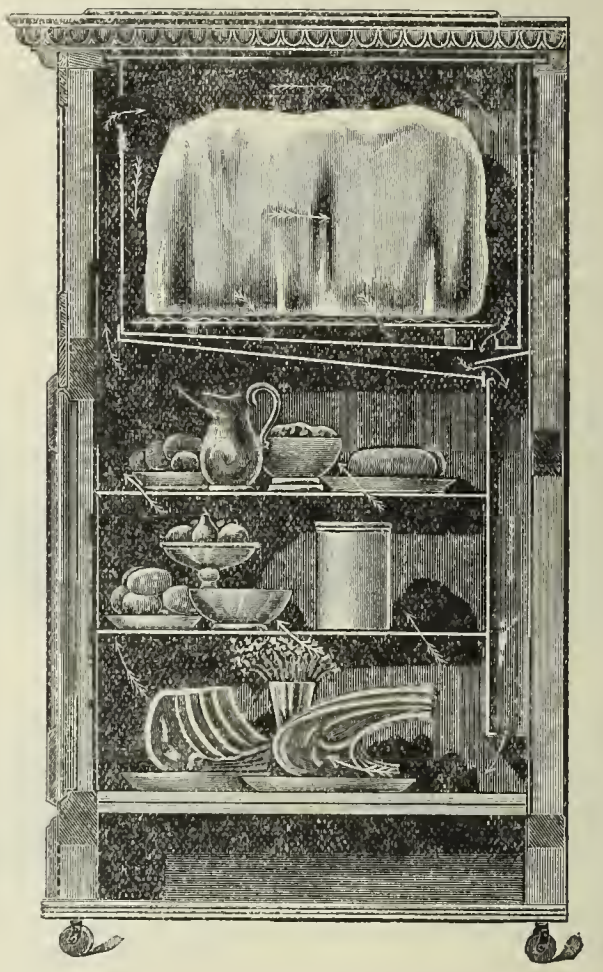
The proposition to sell out was made and concluded practically within two days. The employees of John Alling & Co. knew nothing of the sale until they were notified that the business would be closed up on December 1. R. A. Scovel, a junior member of the Alling firm, probably will go over to the Hibbard firm in some capacity, as will a number of the employees of the former firm.

The firm of John Alling & Co. are composed of John Alling, Simeon H. Crane (Mr. Alling's brother-in-law), and R. A. Scovel. The firm have been doing business in Lake street under various styles for many years. Only one firm besides that of Hibbard, Spencer, Bartlett & Co. now remain who date further back. They are Edwin Hunt's Sons. The latter firm were founded in 1847, and are the oldest Hardware firm in the city. Mr. Alling succeeded John S. Buchanan & Co. 32 years ago. Simeon H. Crane and R. A. Scovel were employees at the time, but came into the firm a few years later. The original firm of John S. Buchanan were established about ten years prior to 1865. These two firms and William Blair & Co., who a few years ago changed to Horton, Gilmore, McWilliams & Co., were the pioneers in the Hardware business in Chicago. They began doing business in Lake and South Water streets when there were few stores anywhere else, and they have stuck to their old locations and brought the rest of the Hardware business of the city close by.

William G. Hibbard started in business in 1855. The firm were known as Tuttle, Hibbard & Co. The name of Spencer was incorporated into the firm in 1865, and the firm took their present style in 1871, when A. C. Bartlett became a member.

Eclipse Cleanable Refrigerator.

One style of the Eclipse cleanable refrigerator made by the Eclipse Refrigerator Company, Burlington, Vt., is shown by sectional view in the accompanying illustration, the removable parts being in place and the cold and warm air currents, giving, it is pointed out, a positive circulation, are indicated by the arrows. The special feature claimed for this refrigerator is that it has a removable tank and at the same time it has a positive circulation of dry air. It is provided with a rear flue through which the cold dry air enters at the bottom of the provision chamber, thus going under all moisture and odors from the food and creating a circulation upward and over the ice. The ice chamber is constructed so that an unusually large ice capacity is afforded which makes a saving in the ice, and better preservative results are obtained. The refrigerators are lined with zinc, all joints soldered, while the walls are constructed with well insulated dead air spaces. One side of the frame is covered with tough heavy sheathing paper, made specially for the company, and the other with stout felt paper, forming one or more dead air spaces according to the size of the refrigerator, covering all joints and nail holes and making a tight wall. The refrigerators are finely finished in hard woods, and are mounted on ball bearing casters. They are provided with a swing base in front, which swings either in or out, and when in the former position is caught by a spring, which is alluded to as a very convenient arrangement for sweeping. The ice rack of the refrigerator is made of bright, galvanized or corrugated steel, riveted to cleats in such a way as not to prove an obstruction to the circulation under the ice or to free drainage to the waste pipe. The Eclipse line includes plain and ornamental refrigera-



Sectional View of Eclipse Cleanable Refrigerator.

tors and ice chests in hard wood for families and grocers' use, and while it is a new one only just put on the market, the orders, we understand, are coming in for them quite freely. The firm issue a 40 page 1898 catalogue, profusely illustrated, and giving all necessary particulars of the Eclipse refrigerators. The trade will be interested in securing a copy of this publication, which will be sent on application.

Erie Aluminum Ware.

"Erie Aluminum Cast Ware" is the subject of a dainty catalogue and price-list just issued by the Griswold Mfg. Company, Erie, Pa., showing, among other articles, several new goods in cast aluminum recently put on the market by the company. The former line made by them is shown to have been improved by the addition of ebony handles, and other novel and useful points have been introduced. Special attention is called to the new line of aluminum hotel ware, and the announcement is made that other articles are about to be added. The present catalogue embraces coffee and tea pots, five o'clock tea kettles, water pitchers, chafing dishes, baking dishes, waiters, dippers, ladles, spoons, salt and pepper shakers, tea kettles, skillets, griddles, saucepans, cuspidors, soap dishes and aluminum house numbers in large variety. Every piece is guaranteed perfectly made and

cast from best No. 1 aluminum. The get up of the publication is very tasteful, the cover being dark green with silver lettering, bearing on the front the well-known "spider" trade-mark of the Griswold Company. The inner pages are printed in green, with attractive half-tone illustrations. The concern anticipate a large trade in their cast aluminum goods for the holiday season. The Griswold Mfg. Company are represented in Europe by Louis Leakey, 127 Farringdon road, London, E. C., England.

Efforts to Secure a Consolidation of Enameled Ware Interests.

Reports have been given currency in the daily press in regard to the attempt to bring manufacturers of enameled hollow ware into a strong organization which will have control of the market. These reports are many of them greatly exaggerated, both in regard to the scope of the movement and the progress which has been made in carrying it out. Negotiations are undoubtedly pending having for their object the unifying of the interests of a number of the enameled ware manufacturing companies of the country. Several representative men identified with Eastern interests of this character recently visited St. Louis for the purpose of inspecting the plants of the St. Louis Stamping Company. Ex-Congressman F. G. Niedringhaus, now head of the St. Louis Stamping Company, is taking a prominent part in the negotiations, and it is believed will be the president of the new company if the projected plans materialize. Nothing definite has been actually determined as yet, but there is good reason for believing that such a movement is contemplated. Among the producers of enameled ware likely to be concerned in the undertaking are several in Chicago, New York and other parts of the country. It is reported that the manufature of tinware may also be covered by the new company. There are several important concerns who, while friendly to the movement and favorable to such an amalgamation of interests, because of its effect on the market in diminished competition, say definitely that it is against their policy to enter into such a combination. Further developments will be awaited with interest.

Detachable Handle Coffee Pot.

Manning, Bowman & Co., Meriden, Conn., and New York, are putting on the market detachable handle tea and coffee pots, one of the former being shown in the accompanying cut. With the detachable handle the pot may be placed on the stove and the handle at once detached to prevent injury from the heat. The handle can

Detachable Handle Coffee Pot.

then be used with comfort when the tea or coffee is ready to be served. In connection with the detachable handle the pots are provided with an asbestos cushion, so that the best pots may be placed on any gas or oil stove as well as on a stove or range.

"The Best" Wrench.

The accompanying illustrations represent the various uses to which a new combination tool can be applied

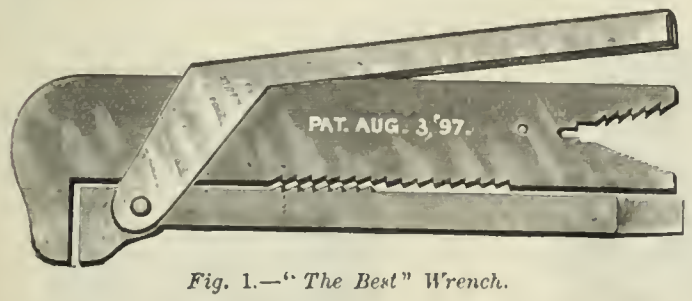


Fig. 1.—"The Best" Wrench.

which has been brought out by the Best Wrench Company, 21 Quincy street, room 602, Chicago. Four complete tools are combined in one—namely, an adjustable wrench, Fig. 1, an alligator wrench and nipple wrench, Fig. 2, and a screw driver, Fig. 3, thus forming a very desirable set for bicycle use as well as other purposes. The length of the tool when closed is 5 inches and its weight is 4½ ounces. It is stamped from cold rolled steel, case hardened, nickel plated and finely finished. Being but ⅛ inch thick, it can be inserted in very narrow places. When used as an adjustable wrench the jaws open 1¼ inches wide and ¾ inch deep. The teeth on the lower edge of the body, engaging in the teeth of the screw driver, hold the jaws rigidly, but the grip can be instantly released. The alligator jaw will turn a nut with corners

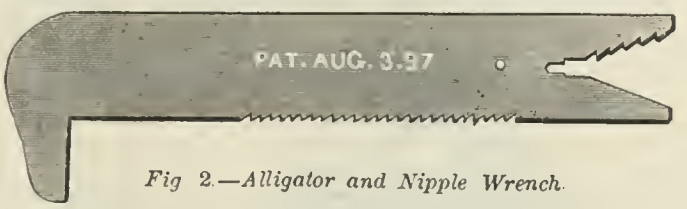

Fig 2.—Alligator and Nipple Wrench.

rounded from use. Larger sizes will be brought out in the spring for machinists, agricultural implements and general use, the proposed sizes being 6½, 8 and 10 inches, the jaws

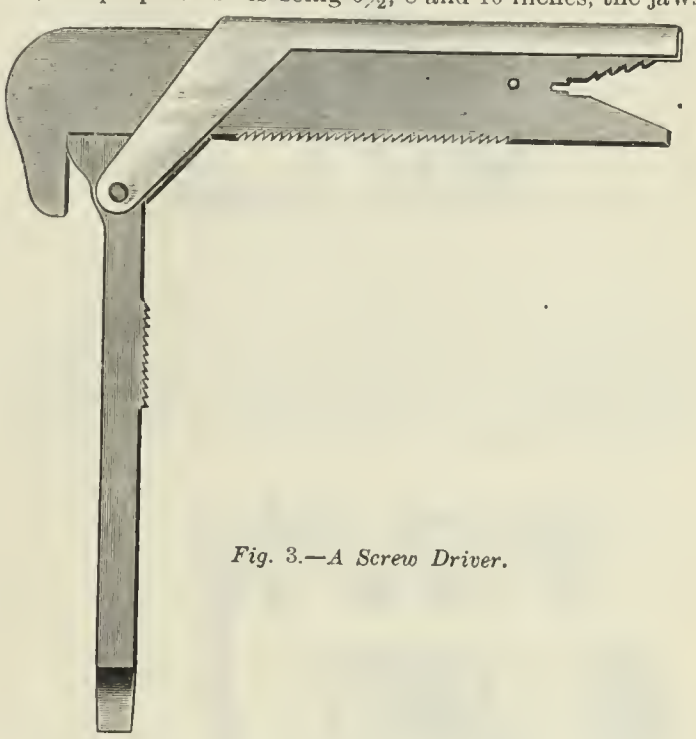

Fig. 3.—A Screw Driver.

opening 1½, 2 and 2½ inches respectively, thus giving them a good range. The wrenches are sold in the 5-inch size so as to retail at 25 cents, or with fine leather pocket at 30 cents.

MEMORANDA.

The Berger Mfg. Company, Canton, Ohio, are sending to the trade what they call their "Yellow Kid," a large card carrying on the back a striking likeness of this nondescript individual, who has something of interest to say respecting Berger's Lanterns. On the front of the card where the address is given are engravings of several styles of Lanterns, and an intimation that they are what the trade are looking for. The Berger Mfg. Company report that their Lantern has given perfect satisfaction, and that the sales are such as to convince them that it is about perfect in construction.

The Model Specialty Mfg. Company, Buffalo, N. Y., have been incorporated, with $6000 capital, to manufacture Tinware, &c. The incorporators are F. C. King, B. H. Phillips and F. H. Russ.

Etheridge & Baker, Macon, Ga., have lately completed a number of improvements in their establishment. The store room has been doubled, and modern shelving, rolling ladders, &c., installed. A line of House Furnishing Goods, Stoves, Tinware, &c., has also been added to the stock formerly carried. The business is principally retail, but some wholesale trade is done.

Sidney Shepard & Co. are the Buffalo agents for the sale of the Aluminum products of Pittsburgh Reduction Company. They are carrying a stock of the goods.

F. B. Volz is about to take possession of his new building in Janesville, Minn. The building is a two story brick, 22 feet wide and 90 feet long. It has a plate glass front and hardwood shelving embellishes the interior. Mr. Volz handles a varied line, including Shelf and Heavy Hardware, Stoves, Tinware, Sporting Goods, &c.

The T. J. King Company, Richmond, Va., have been incorporated, with a capital stock of $10,000. The officers are T. J. King, president; W. Meade Adamson, vice-president, and C. W. Winn, secretary-treasurer. They will conduct a wholesale and retail business in Hardware, Tinware, Stoves, Sporting Goods, Implements, Seeds, &c.

The Columbia Hardware Company have opened a new hardware store at Northport, Wash. They are dealers in Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

James Porch, Chebanse, Ill, dealer in Hardware, Stoves, Agricultural Implements, &c., will shortly commence the erection of an Implement warehouse.

Universal Food Chopper.

Landers, Frary & Clark, New Britain, Conn., are manufacturing the Universal food chopper, as shown in the accompanying engravings. Fig. 1 represents the chopper

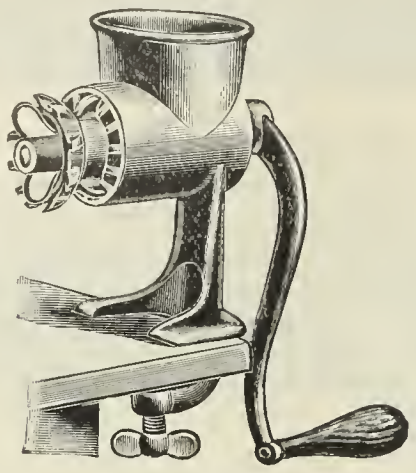

Fig. 1.—*Universal Food Chopper.*

as put upon the market. Fig. 2 illustrates the different parts disassembled. The different cutters seen in Figs. 3, 4 and 5 are put up with each chopper, and are designed for chopping a great variety of articles. The cutter in Fig. 3 is for chopping fresh and dried fruits, vegetables,

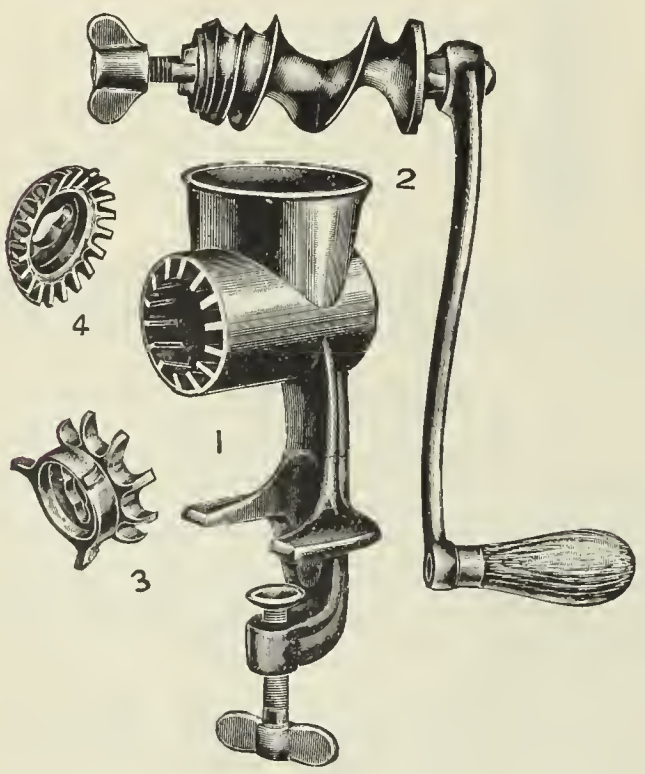

Fig. 2.—*Parts of Chopper.*

shell fish, cooked meats, nuts, &c. Fig. 4 shows the arrangement for chopping raw meat, bread and other foods. Fig. 5 shows the method of pulverizing dried bread and crackers, and treating horseradish, cocoanut, &c. All the parts are tinned, and one size, No. 1, is made for family use. The manufacturers claim for this utensil that it chops coarse, medium or fine, does not mash, is self sharpening, and that all parts are interchangeable.

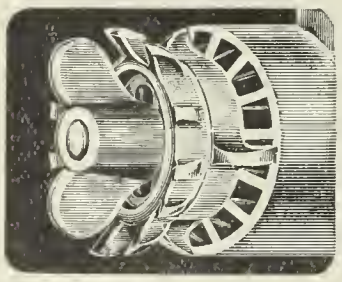

Fig. 3.—*Cutter for Chopping Vegetables, Fruit, &c.*

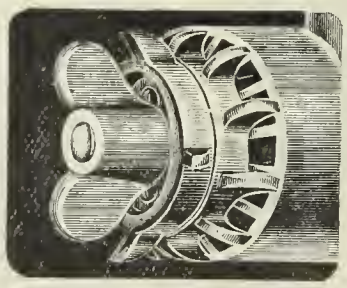

Fig 4.—*Cutter for Meat and Food in Small Pieces.*

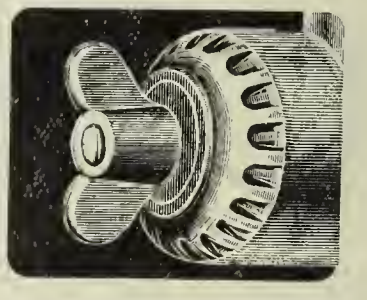

Fig. 5.—*Cutter for Pulverizing Bread, Crackers, &c.*

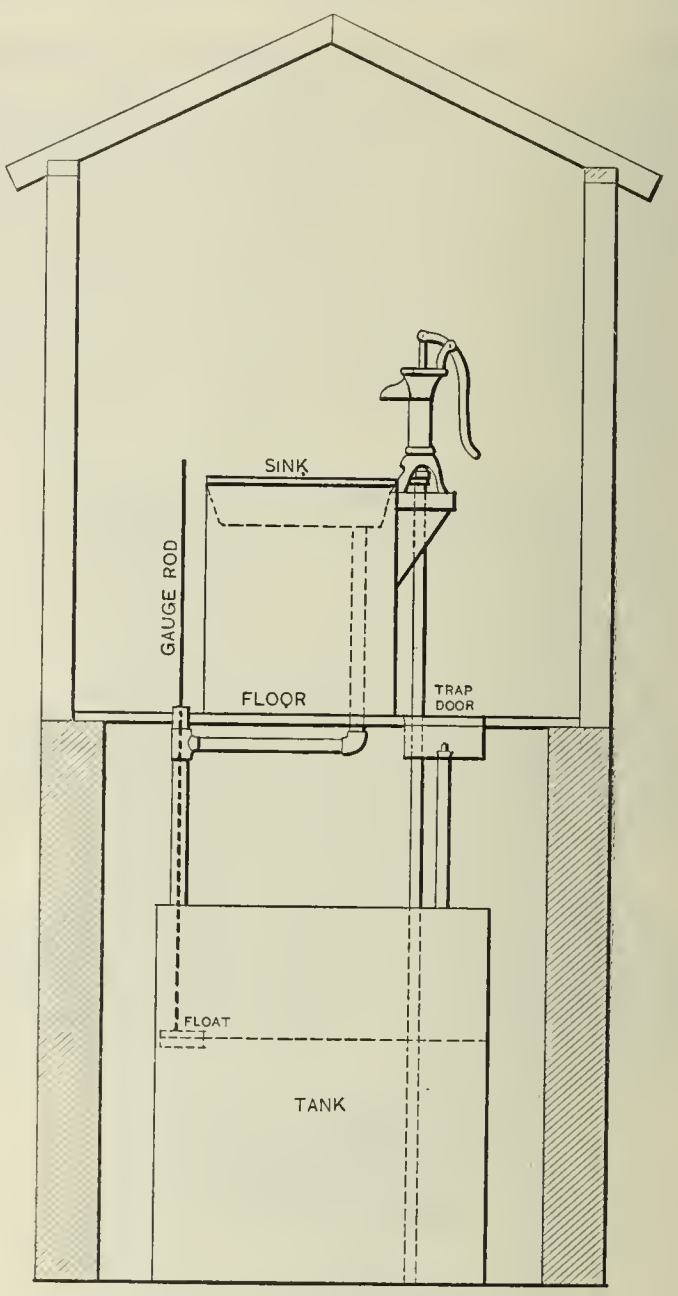
Gasoline Tank, Pump and Sink.

The arrangement for handling Gasoline at retail illustrated herewith is in successful use by M. Conner & Son of Plymouth, Mich. It consists of a tank, pump and sink, with the necessary pipes, inclosed in a building especially erected for them. The tank is round and is made of steel, with a capacity of five barrels. It is placed under the floor and is surrounded by a brick wall



Gasoline Tank, Pump and Sink.

6 feet high. Resting on the brick wall is the wooden structure, which is 6 x 8 feet in size, with 6-foot studding and ¼-pitch roof. The roof is of boards covered with V-crimped iron roofing. The gasoline is pumped up into the measure by means of a pitcher spout pump, with a pipe extending to the bottom of the tank. The sink has a drain pipe leading back into the tank and through a portion of this a gauge rod passes, to the lower end of which is attached a float. The gasoline is introduced into the tank by way of the trap door and pipe. This pipe has a plug at its upper end. Several insurance men who have seen this arrangement express themselves as much pleased, and state that it is the best method of handling gasoline that has come under their observation.

STOVE TRADE NOTES.

Plaster Casts and Other Methods of Molding Shell Forms.*

BY JOHN C. KNOEPPEL.

The art of constructing plaster casts for the purpose of taking off patterns in metal belongs more to the pattern maker than to the foundryman. The molder is not expected to learn this branch of the trade, as it is not universally practiced and probably not understood by many engaged in foundry work, being more in the line of pattern work.

This form of pattern making is very simple and inexpensive, yet very precise and accurate, especially so on irregular work, as patterns that require backing out, such as for deep figured, carved and ornamental designs. To properly back out a pattern so as to make it the required thickness and at the same time produce an even pattern requires great care and tedious labor. We all know that to make patterns for shell forms of any size or shape requires much time and in many cases untrue or uneven patterns are the result, when built of lumber, causing considerable trouble to the foundryman in using the same in sand on account of their being warped and out of shape.

In making patterns in plaster we first have the outer form made of wood in a block shape. Sometimes this outer part is made of plaster by the aid of suitable sweeps and having such ornamentations and figures thereon as are called for by the designer. When the pattern is completed, have a true board made with battens on and tongued on to the end to keep it from warping. Fasten the block to it with screws from the under side, varnish the same and allow it to dry. Then have a flask made for the purpose with an extra nowel part, properly fitted with pins and eyes alike and to suit pattern board.

We are now ready for the plaster cast. Put the pattern board on a bed of sand, fitting the extra nowel to it, and clamp the same. Before pouring in the plaster oil well the pattern and board, olive oil being preferable. Now mix the plaster of paris with water sufficient to give it the consistency of thin mortar, so that it will find its own way to all parts of the pattern, and of sufficient quantity to fill the nowel, allowing it a short time to settle, then strike off and put on a bottom board and secure with screws. Mixing a little parting sand with the plaster hardens it, and it will dry quicker and have less blow holes and bubbles. After a lapse of 15 or 20 minutes roll over the plaster cast and unscrew the pattern from the board, taking off the board, the pattern proper still remaining in the plaster. Rap carefully and draw it out of the plaster. You now have an impression the reverse of your pattern. While the plaster is drying take the block pattern and put it back to its original position, being careful to clean it well before using it for molding from it. At this point you have a concave and convex form of pattern. The plaster cast should be allowed to dry for at least 15 hours, but could be dried in less time with moderate heat.

We are now ready for filling up the thickness in the plaster cast. Have a true board made, with strips of the required thickness fastened to it at each end. This board should be about the size of a kneading board, such as is used in our homes. Mix up a composition of whiting and melted beeswax to the cousistency of stiff dough and with a rolling pin roll out suitable sheets, cutting them into different sizes to suit the work, laying and pressing them carefully in and against the surface part of the cast, using suitable tools, the hands and fingers comiug into play frequently. Secure the filling with tacks.

This filling or thickness composition should be put only where the pattern line shows; all of it should be well varnished, and when sufficiently dry proceed to mold.

Take the bottom board and pattern, place the nowel for the purpose upon it, being careful that there is no shift, and fit into the pins on board tight; ram this up with sand in the usual way, treating the mold as you would in every case, clamping the saue as in the case of pattern makiug or molding. Roll over on the bed and unscrew the pattern from board, taking it off; draw out the pattern proper and finish in the usual way; then proceed to the cope part. Take the plaster cast and place the cope on it, using the saue precautions as with the pattern. Provide suitable gates for pouring and ram this part up with sand also. Roll over, being very careful not to disturb the mold in drawing the cast off the cope. Finish as usual.

We now have both nowel and cope part. Close these two parts together, marking the gating points with flour; take off the cope again, cut the gates, reclose flush and clamp up. When you are ready for the metal, before closing for the last time, be sure that the parting line meets. A little flour will help to fill up if a little slack, thus producing an economical as well as a very true and reliable mold. Sometimes a right and a left form are necessary, such as for heads, birds, animals and statuary, to produce a full form. In that case both sides are made in the manner described above.

While at work some years ago in one of the Western foundries a large number of these patterns were broken and patched so much that they made heavy as well as unsightly castings. The original could not be had, and of course could not be duplicated. I then suggested plaster casts and the work was given me. Using the regular patterns to work from, the first cast was reduced about 10 pounds over the old one. The result being satisfactory, I was given more to make up, due allowance being made for shrinkage.

A large variety of subjects can be made in plaster, and when once acquainted with this branch many lines can be pursued for plumbers' work, tees, elbows, branch pipes, hoppers, &c. These casts can be preserved for future use, or a number of master patterns may be taken off and stored.

Another good way to take off block patterns is by stripping. While it is not as accurate and precise as the plaster cast, yet it will answer in many cases. The plan is similar to that mentioned, but instead of plaster we work the block directly with sand. The block is made and secured to a true board, as in the case of plaster casts. A cope is fitted to it, and rammed very hard with common sand and rolled over. The board is taken off and the pattern drawn out. Suitable wooden strips are cut to conform to the work and of the required thickness. Now have sufficient paper on hand, cutting the same into suitable strips, and lay it on the surface of the mold and nail the paper to the sand until the required thickness is obtained. Then commence laying on the wooden strips, these being cut large or small as required. After all is filled up even with the joint, fill in with fine sand. This might be done while laying in the wooden strips to keep them from falling out of place, being careful not to disturb any part of the mold. Then place the nowel upon the cope and ram up in the usual manner, roll over carefully and take off cope. The cope is what we term a false coping, and is shaken out. After cleaning off the pattern prepare the cope in the usual way. Put it on the pattern board with block fastened thereon, clamping and setting the gate pins and ramming up with sand. This needs to be treated differently from the first case, not ramming too hard, and in the regular way, as in the course of molding. Roll over, take off the board and draw out the pattern. Now finish both parts, nowel and cope. When completed close cope on the nowel, put a little flour on the joint with a bag, lift off and see if joints touch and meet and join securely; see if you have eveu thickness; then close again and the mold is ready for pouring.

Almost any form of work can be made in this manner, of a smooth character, such as kettles, pipes, drum tanks, bathtubs, &c.

Still another simple way is to make a core the desired shape with a sweep, drying it, and then with the thickness strips lay on the core and ram up.

A few years ago I made a steam receiver with reducing end and flanges, 30 inches in diameter, 10 feet long, reducing end being about 20 inches, weighing about 5000 pounds. The party wanted only one casting, and it would not pay to go to the expense of making a pattern. I proceeded as follows: Sweeps were made to conform to the shape at each end and at the center. A skeleton frame was also made and was laid on core plates made in halves and dried, with proper core irons, having suitable holes drilled and threaded to handle them in lifting. I placed one half on mold board, placing the flanges at each end, and having the thickness strips ready to lay on the core and rammed up in the usual way with sand; rolled over and made joint. Put on the other half core, and stripped it as in the nowel, being careful that they corresponded with each other. Put on the cope and set the gate pins and rammed up. After lifting off we took out

*Paper read at the regular monthly meeting of the Western Foundrymen's Association, Chicago, November 17.

the cores and returned them to oven for redrying, finished the mold, setting chaplets and resetting cores, said cores providing their own prints. This was cast in green sand and turned out very good.

DISCUSSION.

C. A Sercomb: The writer does not refer to the expansion or contraction of the plaster after forming the mold. Information as to the expansion or contraction would be valuable.

A. Baer: There would be a shrinkage if anything. If you had to nail it on the board before pouring it would shrink away from the frame and drop.

J. Ott: I have never had any experience in making ornamental patterns, but I have made a great many casts of plaster of paris. The only time that I ever found plaster of paris expanded was when we put the wood into sand. I would suggest the use of emery dust instead of sand. It causes the plaster cast to harden so that you can hardly cut it with a chisel or knife. I have made light plaster of paris patterns, but I have never paid much attention to the expansion or contraction.

W. Ferguson: Although I am not very familiar with reversing, or making patterns as described, the principle is applied in all foundries—in all classes of molding, green sand molding, dry sand molding and loam molding—in getting the one side of the pattern. Suppose you are making a stove door, you make the bottom part of the mold and get the drop from it. The same thing is applied in making a kettle exactly. Sweep up the outside and inside the full size and then take off the thickness. It is the same principle. So it is true in making pipe of all kinds. That is another application of the same principle. I think you will find it in regular practice anywhere.

W. L. Thompson: I can see where the putting on of this strip can be of considerable advantage in ornamental work or in the making of core boxes. But in making a pipe or receiver the ordinary way of sweeping up from a spindle with bearings at each end would be a cheaper way of making the casting. This material is expensive. I do not see there is any advantage gained by using any material for putting on the thickness, for where the outside diameter is swept up first and the cope rimmed on that and then the thickness put on the sweep and the sweep put in the mold after the cope has been taken out, and the thickness swept up that way, it is plainer and cheaper and we can apply it to everything but ornamental work.

A. Baer: As I understand it, this method is used principally on ornamental work. In pipe or kettle work you can sweep readily in green sand, and it is much easier than plaster of paris by having a double sweep.

The Treatment of Gasoline Fires.

Several firemen were severely burned at a recent gasoline fire in Philadelphia on account of not being familiar with the proper method of handling such conflagrations. As a result A. W. Daniel of the Atlantic Refining Company arranged with Director Riter to give the department a series of object lessons. A representative of the *Ledger* who saw one of the demonstrations gives the following account, which he says to the majority of those present was a revelation:

It was with a great deal of incredulity that they heard Mr. Daniel's statement that gasoline is not explosive. Not a few of them thought they knew better, and the scare heads in the newspapers for years had told of "another gasoline explosion," until there seemed to be no doubt of its dangerous character. When he said that gasoline was safer than gas, curiosity to learn something about the subject had been aroused to a high pitch.

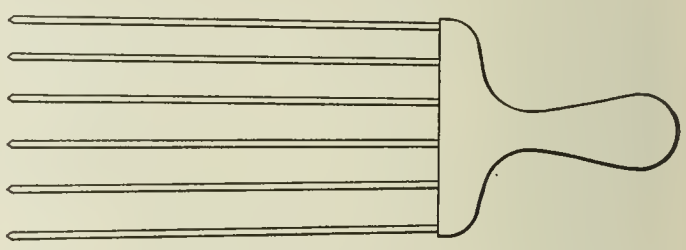
The speaker described the usual course of events in a gasoline accident, such as the policemen and firemen are familiar with. The maid of the kitchen desires to fill the tank of her gasoline stove. She brings out the can, opens the reservoir, pours in the fluid, but neglects to turn out her fire. The can, the reservoir and the stream of fluid are all giving off a vapor, which, mixed with the air, falls down to the burner of the stove, ignites, and the flames extend to the spout of the can and the opening in the reservoir. In the excitement caused by the explosion she drops the can, the gasoline flows over the floor or gets spilled upon her garments, which also take fire, and she runs shrieking from the scene, breathing in the flames and destroying her lungs. What else takes place? The gasoline continues to burn. There are no more explosions, but it calmly burns like a tallow dip. The reservoir has a small flame at its inlet, and the can, if standing on the floor, will have a flame at the spout. Had the maid held the can, it would not have had its contents poured upon the floor, nor upon her dress, and it would not have exploded.

The experiments to show these facts were startling. Mr. Daniel would allow the gas from the reservoir and the can to take fire, and would then deliberately pour the gasoline into the reservoir and let the two vessels burn indefinitely. He handled it as carelessly as if it had been water, and poured a quantity of it upon a plain wooden table and set it on fire, where it burned itself out without setting the table on fire. He put the fire out of the burning cans by stopping up the nozzles, either by the stopper or by anything that would close them. All that was necessary was to stop the flow of the gas, or to exclude the air, and the flame would cease. In most cases the best thing to do with a gasoline fire is to let it burn itself out. If there are no light draperies in the kitchen there will be nothing to catch fire, and when the spilled fluid is consumed it will be easy to extinguish the few things which may have caught fire before it makes much progress. Or the flame may be covered to exclude the air, which will at once put it out.

An Improved Small Venting Tool.

BY THOMAS F. KENNEDY.

I have had in mind for some time an idea of a small venting tool that will save a good deal of the time and labor required to vent a mold and that will enable one to place every hole where it will be most effective. The stove molder making a light plate scores his drag from side to side, or end to end, or may be both ways, at intervals of 3 to 8 inches; then with his one wire he goes back and forth along each score two, three or more times, according to the closeness of the sand or the liability of the piece to scar or blow. On a large plate in close sand this is a very tedious job, and molders often seek to gain time by slighting it, generally to their ultimate loss. It is necessary in nearly all sand, even on small castings, to



An Improved Small Venting Tool.

vent freely around flat gates; slighting these is sure to cause loss. Then in some sand the cope of every mold must be vented, and there are certain pieces the copes of which must be vented in any kind of sand. To make much of an impression on a large cope with a single wire takes so much time that it is a standing temptation to the piece worker to slight it. My idea, and so far as I can learn it is entirely original with me, is to apply the gang principle to small venting tools.

There is hardly any limit to the number of wires that could be used or the variations that could be made in their arrangement, but in its simplest form there would be a single row of from 4 to 12 wires. It would effect a great saving of time and labor for the molder making castings which from their nature or the nature of the sand required venting. The number of wires and distance apart will depend on the size and nature of the work and on the closeness of the sand. A molder working on a straight job, say of oven plates for stoves, might have two or more specially adapted to different parts of the work. He could have one that would reach from side to side of his drag and wide enough so that five or six motions of the hand would cover the whole drag. The wires could be cast into a plate of sufficient thickness, which for convenience in handling could have a handle attached the same as a plasterer's finishing trowel.

The wires could be arranged in rows or irregularly at any distance apart. For his cope and flat gates he should have one just large enough to cover one side of his flat gate, with one or two rows of wires in it. The simplest form of a gang venting tool is illustrated herewith, the handle being of cast iron with the wires cast in. The larger tool would be impracticable on many jobs, but I cannot conceive of a job where at least two wires could not be used to advantage and with considerable saving of time.

All Sorts of Garlands.

An envelope of a pronounced reddish hue has been received from the Michigan Stove Company, on the exterior of which are printed the words "Decided Bargains." On opening it the envelope was found to contain a 16-page catalogue of special bargains in stoves and ranges now being offered to the trade by that company. They comprise the Champion-Garland six-hole range, for hard coal or wood; the Challenge-Garland six-hole range, for soft coal or wood; the Family-Garland four-hole range, for soft coal or wood; the Domestic-Garland four-hole range, for hard coal or wood; the Home-Garland four and six hole range, for wood only; the Family-Garland soft coal or wood cook, the Domestic-Garland hard coal or wood cook, the Home-Garland wood cook, the Ideal-Garland direct draft heater, for coal and wood; the Alpine-Garland heater, for soft coal; the Peerless-Garland heater, for hard coal or coke; the Laurel-Garland direct draft heater, for wood; the Oakdale Garland direct draft heater, for coal or wood; the Syphon Oak-Garland, for coal; the Horizontal Oak-Garland heater, for wood; the Oak-Pennant, for coal or wood, and the Parlor Queen parlor cook stove. These goods for the most part consist of patterns that have just been replaced by new goods for the current season, and are therefore not old, undesirable and unsalable.

ODD PLATES.

Part Three of the annual report of the Secretary of Internal Affairs of the Commonwealth of Pennsylvania, for which we are indebted to James M. Clark, Chief of the Bureau of Industrial Statistics, gives the statistics for the year 1896. One section relates to the manufacture of Stoves, Heaters, Ranges, &c., and presents figures of capital invested, production, value and cost of materials of 39 different works. The total capital invested in plant and working capital of these as given in the report amounts to $5,440,812 and the production is valued at $4,206,864, this product having been made from base material which cost $841,340. The average days of operation of these different Stove foundries amounted to 220, while the average number of wage earners was 3584, the wages they received amounting to $1,684,765, the average daily wages being $2.13. In analyzing the elements of cost in the product, the averages given in the report are 20 per cent. due to basic material, while 40 per cent. was for wages.

The Whitcomb Stove Company, Springfield, Mass., have recently closed a number of heating contracts, among which is a house for H. Sheldon, at Merrick; for J. Roberts, at Brightwood; for M. Taylor, at Chicopee, and also one in Indian Orchard, block of flats for J. Craig, besides a number of contracts in Connecticut and in Springfield. In each instance the heating system includes one of the Royal Heaters made by Hart & Crouse, Utica, N. Y.

The Charter Oak Stove & Range Company, St. Louis, in their page advertisement which appears in another part of this issue call the attention of the trade to their line of Charter Oak Toy Stoves. These Stoves are made in every detail similar to full sized Stoves, and the company state they will bake, roast and cook to perfection. The company urge the trade not to delay ordering these Stoves, as the holiday season will soon be here.

A letter from E. E. Horton, one of the representatives of the Thatcher Furnace Company of New York, informs us that the contract for heating and ventilating the new Richmond Avenue M. E. Church of Buffalo has been secured by Edward Kener, Jr., of that city. The Thatcher Combination Hot Air and Hot Water Heaters will be used for the work in connection with electric fans for ventilating purposes. There will be three No. 256 and one No. 248 Thatcher Tubular Combination Hot Air and Hot Water Heaters used in the heating system.

A contributor to *The Metal Worker* who has seen the article in reference to a hustling salesman gives the following account of another hustling salesman: "In going from New York home on my train recently I was overtaken by a Stove dealer, who remarked that the beautiful weather this fall had made the sales of Stoves beautifully small, and it was now about November 10 or 11 and practically no cold weather. I assured him that he need not feel disappointed, that the cold spell would be due in the vicinity of New York on the 18th. He inquired as to the cause of my positiveness, and I referred him to the DeVoe predictions, according to which on the 18th the first cold weather flag of the season would be shown and consequently the Stove business would take a boom about that period. The subject of conversation then changed, but on the Stove dealer reaching his residence he requested his wife to remind him that there was to be a cold spell on the 18th, that he had been informed that this was DeVoe's prediction and he wanted to take advantage of it. Consequently he arranged to set out on Wednesday, the 17th, to take advantage of this prediction, when to his satisfaction he found that both himself and the cold weather were on hand. As a result of this hustling and taking advantage of the signs of the times he brought in with him orders for 50 Stoves."

The Michigan Stove Company have received a letter from Wm. L. Dudley, director of affairs of the Tennessee Centennial Exposition, announcing that a silver medal, the highest award for any stove exhibit, had been voted their exhibit of Garland Stoves and Ranges. Accompanying this letter was also a beautiful engrossed diploma of award, which is very highly prized by its recipients. In addition, the officers of the company unhesitatingly state that the benefits derived were more than satisfactory to them.

The Kernan Furnace Company, Utica, N. Y., makers of the well-known line of Kernan Hot Air Furnaces, were awarded a silver medal for excellency at the Tennessee Centennial Exposition, held at Nashville.

The first calendar for 1898 reaching us this year comes from Hart & Crouse, Utica, N. Y., with branch offices in New York City, Columbus, Chicago and St. Louis. The advertisement carried is very brief, but is sufficient for all purposes, in view of the fact that the Royal Heaters are well known throughout the United States. If they were some insignificant and obscure creation it would be necessary, perhaps, to illustrate and describe them on the calendar to let the people know what they were, but there are no readers of *The Metal Worker*, at any rate, who have not heard of the Royal Heaters, and the bare announcement is sufficient for the purpose. In consequence of this brief statement there is ample room for decoration, and this consists of a picture, given in colors, representing a painting by Hartson of an old fashioned wind mill in Holland. The calendar at the bottom is in the shape of monthly sheets.

The Boston retail merchants have taken an excellent means of building up their fall trade and concentrating into the week from November 29 to December 4 a great deal of business with out-of-town shoppers. With a view to calling in customers from outside of Boston they have secured for travelers in New England special excursion rates to Boston, and undoubtedly this excellent movement will bring great crowds of shoppers into the old town. While it is intended particularly for the retail merchants, the occasion has not been neglected by the Magee Furnace Company, whose home office is in Boston, at 32 38 Union street. In their announcement this week they invite all, whether old or new friends, to take advantage of the low excursion rates and visit their salesrooms and inspect the Magee Ranges and Heaters. Those handling the Magee goods will do well to accept this invitation, whether they intend purchasing or not, for they will have a cordial welcome, and will find it more satisfactory to inspect the Ranges and Heaters themselves than to judge of their merits from catalogue illustrations.

We regret to announce the death of Jonas Snyder, treasurer of Thomas, Roberts, Stevenson Company, Stove founders, Philadelphia, which occurred November 23. The funeral services are to be held to-day, Saturday, at his late residence, 1519 North Seventeenth street.

The new plant of the Dennison Rolling Mill Company, at Dennison, Ohio, is now in operation. The construction of this plant occupied about four months. It is a two-mill plant, consisting of two pairs of 40-inch hot rolls, one pair of roughing rolls and one pair of cold rolls, with a capacity of 5000 tons of finished material annually. The building is constructed of iron throughout. The main building is 105 x 140 feet, with sheds and electric building. The electric plant consists of one 25-light 2000 candle-power arc and 50-light incandescent generators. The concern use coal for heating furnaces and all other appliances, controlling and operating their own mines, which are situated within a short distance of their plant. Their boilers are four in number, 72 inches by 18 feet, fed automatically by Murphy stokers. The concern advise us that they have orders sufficient to take their output for next four months, with prospects of a large trade right along. The concern are manufacturers of fine sheet steel, common cold rolled, pickled and cold rolled, pickled finished and stamping steel. The officers are W. W. Irwin, president and general manager; E. Langenbaugh, vice-president; C. A. Smith, secretary, and Jacob Shumaker, treasurer.

Robert N. McElroy has severed his connection with Park Brother & Co., Limited, to accept the financial management of the plant of Brownell & Co., at Dayton, Ohio.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Wholesale prices have unerdgone a slight advance and the market has ruled very firm. No change was made in jobbers' quotations for small lots from store, which rule at 14¾c. for Straights Pig. There has been fully the average seasonable demand for consumption, but jobbers purchased moderately and purely speculative interest remains inanimate. The arrivals since the beginning of the month amount to about 1500 tons, which quantity is below the estimated consumption.

Copper —The general condition of the market remains virtually the same as it was at the date of last week's report. Exporters have made no unusual purchases nor displayed remarkably lively interest and operations of home consumers continue to be extremely conservative. Prices have undergone little or no variation. Small lots from stock remain at about 12c. to 12¼c. per lb. for Lake Ingot and 11c. to 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—Orders have been of very moderate proportions. Jobbers generally quote Sheet Copper in retail lots on the basis of 15c. per lb., but this price is shaded in some quarters.

Pig Lead.—A turn for the better has taken place in the market. Offerings have been smaller and less urgent, while the demand has shown improvement, not extending to anywise remarkably large lots. So far as the jobbing trade is concerned, sales are still of very ordinary type, with an almost total absence of active interest among the larger consumers. American Pig in small parcels from store is quoted at 4⅛c. to 4¼c. per lb.

St. Louis advices are as follows: The market is in an interesting condition. The speculative interest in the market is supposed to be quite heavy, and the events of the past few days tend to verify this supposition. Efforts have been made to secure large lots, but producers are unwilling to sell their product beyond the present year. The situation is materially improved, and those in position to know are anticipating an early advance.

Spelter.—The market has continued weak, under the influence of present and prospective large production and absence of expansion of the outlet. Ordinary Western brands are selling in a retail way at 4.65c. to 4.75c. per lb.

St. Louis advices indicate no change in this metal. Consumption is moderately heavy and the outlook for Spelter in that market is fairly satisfactory.

Antimony.—About the usual jobbing business is going on and prices remain quite steady at 7¼c. to 7½c. for Japanese, 7¾c. for Hallett's and 8½c. for Cookson's.

Nickel.—The market remains steady at about 35c. to 36c. for small parcels.

Tin Plate.—While American makers are generally well supplied with orders for delivery in the balance of this year, and some as far ahead as the second quarter of 1898, offerings of futures are more free and prices remain somewhat unsettled. Spot stocks, however, are very firm and deliveries are still delayed by the trouble the mills have experienced in securing Steel. This stringency is gradually abating and the conditions introduced by it into the market will probably have passed away by the end of the year. Meanwhile available stocks are very light, especially of Coke Tins. The demand is so extremely slack, however, that this scarcity makes little impression on the market. The trade at the present time is desperately dull, with no prospect of an improvement before the turn of the year. Retail orders were smaller than for a long time past. Jobbers' quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do. 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3 40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are selling slowly and are nominally unchanged in price.

A special London cable dispatch of November 24, 1897, reports on the British Tin Plate market as follows: Tin Plate has been slow and the demand is quiet, with interest chiefly in specials. Prices are barely steady at about s. 4½d. to 9s. 6d. for ordinary Bessemers.

Sheet Iron.—The demand has eased off to some extent, and the mills are now entering orders for little beyond small lots for early shipment. In the East thin Sheets are in the strongest demand, the heavier gauges of Black Iron being inactive. Galvanized Sheets are dull. Prices are unchanged. Jobbers in this section quote small quantities from stock at 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: A better inquiry has recently sprung up for Black Sheets covering 14 to 28 gauge. The greater part of the new business appears to be coming from manufacturers of Stamped Ware. The demand for Galvanized Sheets, which has been steadily excellent, continues as good as ever. Jobbers' stocks are still being drawn upon for Black Sheets, although the season is so far advanced. Small lots from stock are held at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—Market quiet, with no new features in either domestic or export business. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3.05c.
Zinc	per lb. 2½c.
Zinc Dross in slabs	per lb. 2.60c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

THE IRON MARKET.

Developments have been very meager during the past week. It has become a waiting game in which many are arrayed on the one side who themselves believe, with Benner, that 1898 is to be a very good year. The majority do not expect any decided movement until March or April, and are quite willing to put pressure upon the raw materials in the meantime. They have the usual winter dullness to help them.

A weakening tendency has developed in many lines, and prices are a shade lower. This is true of Bessemer Pig, Steel Billets and Wire Rods. In some branches of the Finished Iron trade there is some activity. Thus Chicago notes quite a tonnage of Bars. In a few weeks the days of making repairs and renewals will be at hand, bringing a natural if only temporary restriction of the output.

Pig Iron.—While deliveries continue good new business is light. There are some inquiries in the New York market for next year's delivery, but buyers and sellers are yet apart. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

In the Philadelphia market buyers of Pig Iron are feeling the market for quotations on deliveries for the first quarter and some for the first half of the coming year. Sellers are rather more disposed to encourage business, but they cannot see their way to making concessions; neither are they willing to go very far ahead at to-day's ruling prices. There is, therefore, a stand off on both sides, which will probably not be broken until natural conditions solve the problem. The chances do not appear to be favorable for immediate activity; neither is it likely that prices will show any appreciable change from the figures quoted during the past several weeks, which have been within the following range for seaboard deliveries, subject to the usual freight differences at points within 100 miles south and west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

Moderate sales are reported in Chicago of local Coke Iron. Inquiries for next year are being received, but

buyers are usually in no hurry to close, an occasional order being entered from some consumer who is of the opinion that he will lose nothing by placing a contract now. Prices are firm, sales being made at our quotations. Southern sales agents also report firm prices, although transactions are quite light and inquiries are not numerous. Quite a little demand has sprung up recently for Lake Superior Charcoal, but only for small lots so far as known. We quote for cash as follows :

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

The Pittsburgh Pig Iron market is extremely quiet and prices are a shade lower. There is considerable pressure on the part of furnaces to sell Bessemer Iron for December, but higher prices are asked for first quarter. Foundry Irons are very dull in this market. We quote, f.o.b. Pittsburgh : No. 1 Foundry, $10.65 to $10.75 ; No. 2 Foundry, $10.15 to $10.25 ; Bessemer, $10.15.

There is no change in the Pig Iron situation in the Cincinnati district. There has been a very fair tonnage booked during the past week, made up mainly, however, of the daily driblets which no one in commenting thinks worthy of special consideration. Inquiry within the past few days, however, has brightened somewhat. There is hardly enough of this inquiry, however, to indicate much of a buying movement in the last weeks of 1897. Prices are nominally unchanged and the general situation has many points which ought to work out a strong market when the buyers appear. The general situation loses nothing from week to week in healthy tone and vast quantities of Iron are still being melted. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

In St. Louis the market continues to show remarkable strength in view of the dullness at present prevailing, but the explanation is readily found in the condition of stocks both in consumers' and producers' hands, which show a steady decline. The consumption of Pig Iron is heavier than the most sanguine anticipated, and as there is no immediate prospect of any falling off in this direction the prices at present ruling are thought quite likely to be maintained, even if no advances are recorded. Business is expected to be unusually heavy after the turn of the year, as many concerns are allowing their stocks to run down so as to make their annual inventories. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

TRADE NOTES.

We are indebted to the Pope Mfg. Company, Hartford, Conn., for a copy of their handy Columbia desk calendar for 1898, being the thirteenth annual edition of that useful publication. It is in the form of a memorandum block, a page being provided for each day of the year. Plenty of space is allowed for memoranda, and at the top of each page is given a quotation, a verse, a squib, or a testimonial from some admirer and user of the famous Columbia wheel. The calendar stand is so arranged that it may either stand on the desk or hang upon the wall.

The Norwich Nickel & Brass Company, Norwich, Conn., have been incorporated, with a capital of $15,000, by W. A. Aiken, E. C. Aiken and Ed. A. Tracy.

The Bignall & Keeler Mfg. Company, Edwardsville, Ill., report a heavy demand for their Peerless and Duplex Pipe Threading and Cutting Machines. Among the recent sales they report the following: Armour & Co., South Omaha, Neb., and National Tube Works Company, Chicago, three machines each; Nelson-Morris & Co., St. Joseph, Mo., and United States Government for new dredge boats for Mississippi River Commission, two each, and one each to the following: G. T. Reynolds, Cairo, Ill.; Ogden Gas Company, Chicago, Ill.; Swift & Co., St. Joseph, Mo.; Wabash Railroad Company, Decatur, Ill., and W. S. Laycock, Sheffield, England.

CHICAGO REPORT.

Scrap.—Dealers are again beginning to accumulate stock, in anticipation of an improvement in the demand. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9 c.
Red Brass	....	7½c.
Yellow Brass	....	6½c.
Light Brass	....	4 c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Sales are light and prices are being cut. The card on carload lots of 12 tons minimum is now as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85

Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

A strong company of Eastern capitalists, including ex-Governor Flower of New York State and J. W. Hinckley, Anthony N. Brady and Perry Belmont of New York City, have purchased the entire property of the Walker Company, manufacturers of electrical apparatus, Cleveland, Ohio. The Walker Company have extensive factories and foundries in Cleveland, covering many acres.

A special dispatch from Dallas, Texas, reports that 400 square miles of prairie in Lubbock, Hale and Crosby counties, in that State, were burned over by a severe prairie fire last week. Large numbers of cattle and sheep were destroyed and many farmers lost their winter feed stock.

The Inland Iron & Forge Company have been incorporated, with a capital stock of $225,000, to operate the plant of the defunct East Chicago Iron & Steel Company at East Chicago, Ind. The incorporators are P. D. Block, G. H. Jones and Frank Wells. The stockholders of the Inland Iron & Forge Company are practically the same as the parties who now own and operate the Inland Steel Company at Chicago Heights. The business of the latter firm has increased to such an extent that they are unable to accept all the orders offered them, and so arranged to secure the East Chicago plant. It cost originally $300,000.

The Chapin Mining Company, the Pewabic Company, the Antoine Ore Company, the Aragon Ore Company and the Pennsylvania Iron Mining Company at Ishpeming, Mich., have announced a 10 per cent. increase in wages, to take effect on January 1. The increase affects more than 2000 men. There is a shortage of men at all of the mines. The mines will be worked steadily throughout the winter.

THE HARDWARE TRADE.

Trade is showing indications of the near approach of the holiday season and the closing of the year. Merchants are disinclined to buy goods which will be carried over and thus find a place in the annual inventory; travelers are beginning to come home, though the great majority of them are assiduously cultivating their trade and obtaining such orders as they can; jobbers are pushing energetically to get rid of any goods of which they have a larger supply than they want, and are accordingly cutting prices a little more freely; manufacturers are refraining from the solicitation of orders for this year's business, but are, in season goods especially, negotiating for next year's requirements; and the approach of the holidays and the advent of winter weather are stimulating business in seasonable goods and fancy articles for the Christmas trade. Under these conditions the volume of business is diminishing, but trade still continues in fair volume, all things considered. The tone of the market is not quite so strong as it has been, but the quotable changes are few. The most noticeable weakness is in Nails, which have still further receded in price. The manufacturers allude to the lower quotations as caused in good part by the freedom with which the purchasers of Nails before the recent advances are marketing what they have in stock at concessions from the regular quotations. Export business in Hardware and related commodities shows a gradual and on the whole important increase, and the manufacturers of this country are recognizing more and more the desirability of cultivating and holding this class of trade. Whatever may be the disadvantages which result from the low prices which prevail, and will likely prevail, they unquestionably place the country in an excellent position to make goods for foreign markets. Reports indicate a gradual improvement in general trade throughout the country as compared with recent years at this season, and hopeful anticipations are expressed with reference to business.

Advices from Chicago.—Shelf Hardware jobbers report a much better trade. The weather all over the Northwest is now decidedly wintry and the country is rapidly freezing up. A strong demand is experienced for seasonable goods. The early orders placed for these goods were large, but the demand now coming in shows that stocks have been run off and a further supply is needed. This improved buying movement in seasonable goods leads to a heavier demand for the general line. Mails on Monday were unusually heavy, adding considerably to orders which had to be carried over from last week by most houses. The shipping departments are now being rushed and additions are being made to the packing force. An improvement in business this year, owing to the greater fall trade, is now being shown as compared with last year. The gain up to the present time is estimated to have been at least 25 per cent. Some houses will probably be able to show a little larger gain. The cut in freight rates on Colorado lines is still effective and is inducing a large volume of business in that direction. The merchants of Kansas, Nebraska and Colorado, as well as States beyond the Rocky Mountains, are laying in large stocks of goods while they can have them delivered at such extremely low rates as now prevail. Manufacturers' agents report a very good volume of business. A combination has been effected among Rivet manufacturers and the discount to jobbers has been advanced to 80 per cent. Heavy Hardware jobbers report a continued good trade The demand for Iron and Steel is strong and the movement of Wagon Stock is steadily good. Collections are excellent.

Advices from St. Louis.—The Hardware trade continues in the satisfactory condition last noted. The weather has finally turned seasonable and the demand for cold weather goods is remarkably active. The demand for Shelf Goods continues in satisfactory volume and prices are being well maintained. Holiday goods are finding ready sale, as are also the different lines of Heavy Hardware. Ammunition is also among the active articles. Nearly all the jobbing houses will show an excellent gain in comparison with their business for 1896. Collections are satisfactory.

NOTES ON PRICES.

Wire Nails.—The principal change to be noted in the Wire Nail market since our last issue is a further falling off in the demand and the prevalence of slightly lower prices. Most of the jobbing houses who have stocks of Nails are preferring to dispose of them at a narrow margin of profit rather than carry them over into next year. New York quotations are $1.65 for small lots from store. The negotiations with a view to the control and consolidation of Wire interests are still in progress, and the project, while not by any means consummated, is assuming more definite shape.

Advices from Chicago.—Heavy shipments are still being made to the West by leading Nail manufacturers. The continuance of the low freight rates is decidedly stimulating this movement. The termination of the yellow fever scarce in Texas is also bringing heavy orders from that section, with which a light trade had been done during the fall months. While the market is easier at present the manufacturers look forward to better spring prices. Jobbers report an improvement in their sales, with prices quoted in a regular way at $1.50, with concessions to the best trade.

Advices from St. Louis.—The market has failed so far to show any improvement, and in the absence of any heavy demand no advances are anticipated. Jobbers ask $1.55 to $1.60 for small lots from store.

Cut Nails.—There has been little change in the Cut Nail market since our last report. In some cases, principally in the West, slightly lower prices are obtainable. The mills report a demand which is apparently somewhat stimulated by the low prices ruling, and they also refer to the recovery by Cut Nails of trade which has been going for some time to Wire Nails. New York quotations for small lots from store are $1.35 to $1.40.

Advices from Chicago.—The demand for Cut Nails is light, with prices unchanged at $1.45 for small lots from stock.

Advices from St. Louis.—The Cut Nail market continues in the unsettled condition last noted. The demand is light and prices continue weak. Jobbers ask $1.45 to $1.50 for small lots from store.

Barb Wire.—Both manufacturers and dealers report but little doing in Barb Wire. Prices are pretty well maintained.

Advices from Chicago.—Manufacturers report a continued good trade with the West and Southwest. The demand in this immediate vicinity, however, is light, and is not expected to improve until some time in December, when the usual buying movement may be expected for spring delivery. Jobbers quote $1.55 to $1.60 for Painted and $1.85 to $1.90 for Galvanized in small lots from stock.

Advices from St. Louis.—The market is dull and prices are inclined to weakness. Jobbers are asking $1.60 for Painted and $1.90 for Galvanized for small lots from stock.

Smooth Wire.—There is no change in the price of Smooth Wire, but the demand is sluggish. As usual at this season the trade are refraining from purchasing beyond their immediate wants.

Glass.—Reports of recent meetings held by representatives of the associated manufacturers and workmen indicate that a settlement of the wage question is nearer than at any time during the past three months. The discount on imported Glass has been advanced from 60 and 20 to 60 and 10 per cent. This advance was made necessary by the recent advances of American Glass to equalize the prices of foreign and domestic products, the New York jobbers' price for American Glass now being 60 per cent. discount. Chicago jobbers advanced the price of American Window Glass last week to 60 per cent. off, as had been predicted. This advance is expected to be followed shortly by another rise of 5 per cent. The local jobbers are of the opinion that their stock rooms will be completely cleaned out by January 1 unless the wage question is speedily settled and the factories started up so as to produce new Glass. It is stated that with the recent advance in prices the list is now 35 per cent. higher than four months ago.

Linseed Oil.—A good trade has been done in city brands, and there is at present a fairly active demand. Retail prices are higher and firm at 39 to 41 cents.

White Lead.—There has been a good jobbing distribution and some contracting for next year's delivery. The spot business is at old prices; next year's contracts will be decided upon later. Generally the market remains firm, as it has been for several weeks.

Spirits Turpentine.—Fairly large sales have been made in the South, and in this market prices are firm.

The regular scientific meeting of the Engineers' Society of Western Pennsylvania was held in the lecture room of the society, 410 Penn avenue, Pittsburgh, Pa., Tuesday evening, November 16, 1897. The paper of the evening was a report of the Committee on Roads. The report was very elaborate, and gave exact information concerning a considerable number of types of roads with cost of labor and material. There were also illustrations given showing the methods of construction. To the regular report of the committee was subjoined a second report, consisting principally of a report on the road laws of the State of Pennsylvania. After the reading of the paper there was an animated discussion, and a great many details were brought out with respect to the methods of construction. A point strongly insisted upon was the necessity of making very full and careful preliminary surveys. It was stated that one of the great difficulties in the way of obtaining good roads was the fact that the authorities and tax payers were not willing to spend the time or money involved in making preliminary surveys.

A new road law drawn np by Arthur Kirk was referred to the Committee on Roads for examination and criticism.

The Raddatz Submarine Boat.

A successful submarine boat is reported to have been built at Oshkosh, Wis., by Richard Raddatz, a young mechanical genius of that city. It has been tested on Lake Winnebago. A local journal thus describes it :

A year ago the vessel was virtually completed and a number of voyages were made. They were successful in exposing many minor defects and one important one—the vessel was too short to handle to advantage. So last spring a middle section was inserted, increasing its length about one-third. During the last summer Raddatz and a helper have been at work testing, altering and improving, and quite recently the submarine boat was declared finished. Its shape is that of a donble cone, with a tnrret rising at the juncture, which is amidships.

The boat is 65 feet long, 4 feet wide and 7½ feet high, and is built of steel plates on a heavy framework of angle irons, with an estimated strength sufficeint to withstand safely the pressnre due to a snbmersion 500 feet deep. It carries two sets of propelling machinery, a hot air engine of 30 horse-power for use on the surface and an electric motor for propulsion beneath the surface, and a number of trials, it is claimed, have demonstrated the ability of the craft to navigate beneath the surface of the water for a day at a stretch with safety and without inconvenience to the crew. Trials have also shown that the craft can be made to rise and fall in the water at the desire of the operator and with various velocities, and a complete submersion of the boat can be made in the short space of 18 seconds, while if it be desired to hold the craft snspended in the water at any desired depth an automatic machine is provided which is capable of maintaining the ship at a given depth for hours at a time with a variation in depth of less than 1 inch from the ginn mark, either with the ship in motion or when still. As far as trials have been made all machinery has worked well irrespective of the depth at which the ship has happened to be, and it has always obeyed promptly the will of the single operator and pilot—a crew of one man being all that is necessary to navigate the vessel. Every effort has been made to insure the supply of pure and respirable air in proper qnantities to the crew, and great care has also been taken to insure the return of the craft to the surface in case of accident to the machinery of a sufficiently serious natnre to endanger the lives of the occupants. An automatic machine is provided to prevent the submersion of the craft, either by intention or accident, beyond a predetermined depth.

With its turret protruding above the water it has made 14 miles an hour, and its prow is fitted with a steel ram that wonld pierce the side of any iron steamer on the great lakes. In the turret are strong glass lenses for exploration purposes, and through a hatchway in the top of the turret is the only mode of egress or ingress. Since completed voyages have been made daily.

Rates on Steel Rails.—The following rates on steel rails have been established by the Joint Traffic Association : $4 per gross ton from Lorain, Ohio, to Montreal and $3.80 from Wheatland, Pa., to the same point. The managers of the Joint Traffic Association recommend that, effective n legal notice, the duly authorized east bound rates on new iron and steel rails, in carloads, from rail producing districts to eastbound basing rate points be also authorized on like traffic to points duly established as taking same eastbound rates, as per eastbound guide books of the various fast freight lines.

Secretary James H. Nutt and the Scale Conference Committee of the Amalgamated Association, at Youngstown, Ohio, last week examined the reports of the iron manufacturers as to the price received for iron bars during September and October. The average of prices was such that there will be no change in the Amalgamated scale for November and December.

On October 19 a meeting took place at Cologne of the manufacturers of steel of Western Germany. Many works from the Rhenish-Westphalian district, and also from the Saar district and from Lorraine-Luxemburg, were represented. There were addresses by E. Schroedter of Duesseldorf and Dr. Beumer, who urged that efforts be made to retain and develop the German export trade. A resolntion was passed expressing the conviction that drawbacks on exports of iron and steel from Germany are an effective means for maintaining a satisfactory condition of business, and particnlarly to give steady employment to the workmen. The formation of an organization on a broad foundation was advocated. Snch drawbacks must be granted by syndicates to syndicates, aiding the export merchants. It is reported that the Rhenish-Westphalian pig iron syndicate and the Rhenish-Westphalian coke syndicate have expressed their willingness to cooperate. A committee was appointed to work out details. The wire trade is one of the leading branches kept in view.

The annual meeting of the American Institute of Mining Engineers will be held at Atlantic City, N. J., on February 15, 1898. A meeting in Mexico is planned for October, 1898.

Special Notices.

Stove and Steel Range Manufactory

Located at MUNCIE, IND.,

To be Sold at Public Sale.

The stockholders of the JOSEPH BELL STOVE & RANGE COMPANY have passed an order to sell their plant and equipment and stocks of material and manufactured stock at public sale, on Wednesday, the 5th of January, 1898, on the grounds of the company at MUNCIE, IND.

The property consists of over 6 acres of ground conveniently situated at MUNCIE, IND., on the West Bank of White River, on the line of the Lake Erie & Western Railroad and accessible to the Big Four Road. The buildings thereon are nearly new and of substantial construction. The Molding building, of brick, is 135 by 145 feet. There are two cupolas. The Mounting and Storage building, also of brick, is two stories high, 260 by 60 feet. Office building and show room of frame, two stories. All of the best construction and conveniently arranged.

There is a complete Nickel Plating plant. There are tools and appliances for the economical turning out of the best class of work.

There is a large line of patterns which includes cooking and heating stoves and a line of popular Steel Ranges.

A gas well on the premises belonging to the company furnishes an abundant supply of natural gas. These works have been in operation until recently and are in order to resume work at any time.

The entire property, including all stock on hand at day of sale, materials, patterns, tools and equipment and good will, will be sold in one lot. Sale to take place on the grounds of the company, at MUNCIE, IND., on Wednesday, the 5th January, 1898.

The terms will be made accommodating. Persons desiring information will please address the undersigned.

JOSEPH BELL STOVE & RANGE CO.,
Muncie, Ind.

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Sent, post-paid, upon receipt of price, by

"Scott's Extra Coated"	"ABSOLUTELY THE BEST" 46 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method"	Strictly Hand Dipped, Palm Oil process throughout, 36 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 36 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style"	Very bright, clean and handsomely mottled, 24 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest"	The very best Bright Charcoal Tin. Supero coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton"	An excellent plate, well coated. "Melyn" grade.
"Furnace"	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

—SEVERAL British Indian papers print the following, written by a native subordinate in the diary while in a very trying position:

"Up a tree where I adhere with much pain and discomposure while big tiger roaring in a very awful manner on the fire line. This is very inconsiderate tiger, and causes me great griefs, as I have before reported to your honor. This is two times he spoiled my work, coming and shouting like thunder and putting me up a tree and making me behave like an insect. It is a very awful fate to me and the tiger is most inconsiderate."—*Youth's Companion.*

—Got Him a Box.—"Did you give that man money?" was asked of a citizen who had just parted with a man who walked with a limp.

"Yes—a quarter."

"He's a chronic beat."

"Well, perhaps."

"But you should discourage such characters."

"Yes, I know; but when a man comes up to you and calls you colonel, and says he was right behind you when you charged that battery at Antietam, how can you go back on him?"

"But you were not at Antietam."

"No."

"You were not a colonel."

"No."

"You didn't even enlist in the late war."

"No, and do you suppose I'm going to own it up for the sake of saving a quarter? Not much! I've got a half dollar for the first man who calls me general."—*Exchange.*

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V BURR.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age*.

Various operations and effective methods of repairing are carefully described, and over one hund ed and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.

Niagara
Adjustable Pipe Folder.

It has been found that the old style Stove Pipe Folders (Wright s, &c.) cannot be relied on to turn locks of even and uniform widths. The Folder herewith shown overcomes this difficulty entirely. The edge of the sheet is inserted and clamped the same as usual. It is folded by swinging the bar and blade, between which the material is clamped, towards the operator, and while passing the upper edge of the frame the material is bent around the folding blade. To prevent the edge of the frame from being worn off, a steel rod is inserted to protect it. This rod can be renewed at a trifling expense.

The Niagara Adjustable Pipe Folder is sure to produce a lock of uniform width the entire length, as variations in the hardness of the material have no influence whatever. Furthermore, the Folder possesses the advantage of having an adjustable gauge for locks from 3-16 to ½ inch wide. Length 30 inches.

BRIDGEPORT, CONN

—"The Examiner" says that once when Chief Justice John Marshall was driving, the hub of his wheel caught on a small sapling growing by the roadside. After striving unsuccessfully for some moments to extricate the wheel, he heard the sound of an axe in the woods, and saw a negro approaching. Hailing him, he said: "If you will get that axe and cut down this tree I'll give you a dollar." "I c'n git yer by 'thout no axe, ef dat's all yer want." "Yes, that's all," said the Judge. The man simply backed the horse until the wheel was clear of the sapling, and then brought the vehicle safely around it. "You don't charge a dollar for that, do you?" asked the astonished Chief Justice. "No, mnssa, but it's wuf a dollar to larn some folks sense." The quick-witted darky got his dollar without further questioning.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

MAGEE FURNACE CO., Boston, Mass.

QUICK MEAL

"Quick Meal" Gasoline Stoves.
"Quick Meal" Gas Stoves.
"Quick Meal" Blue Flame Oil Stoves.

For the season of 1898 the Burner of the Regular "Quick Meal" Junior line will have added to its Lighting Cup a device to make its Flame burn almost blue and entirely free from Smoke. Add to this the superiority of the Turn-down Safety Tank—preventing all danger of accident—and the patent "Quick Meal" Lever for operating the Valve and the advantages of the "Quick Meal" Junior over other so-called "Cheap Junior Stoves" become so apparent—they are so many and so decided—that no dealer considering his own interest (as to profits that can be made as well as the satisfaction the stove will give his customers) should ever think of selling a Cheap Junior, a stove devoid of safety, devoid of merit, devoid of profit, devoid of satisfaction.

For purchasers who are able to pay a reasonable price there is nothing like the "Quick Meal" Evaporator. It stands at the head, it pays the Dealer a good profit and it never fails to act as a missionary in making sales.

Ringen Stove Co.

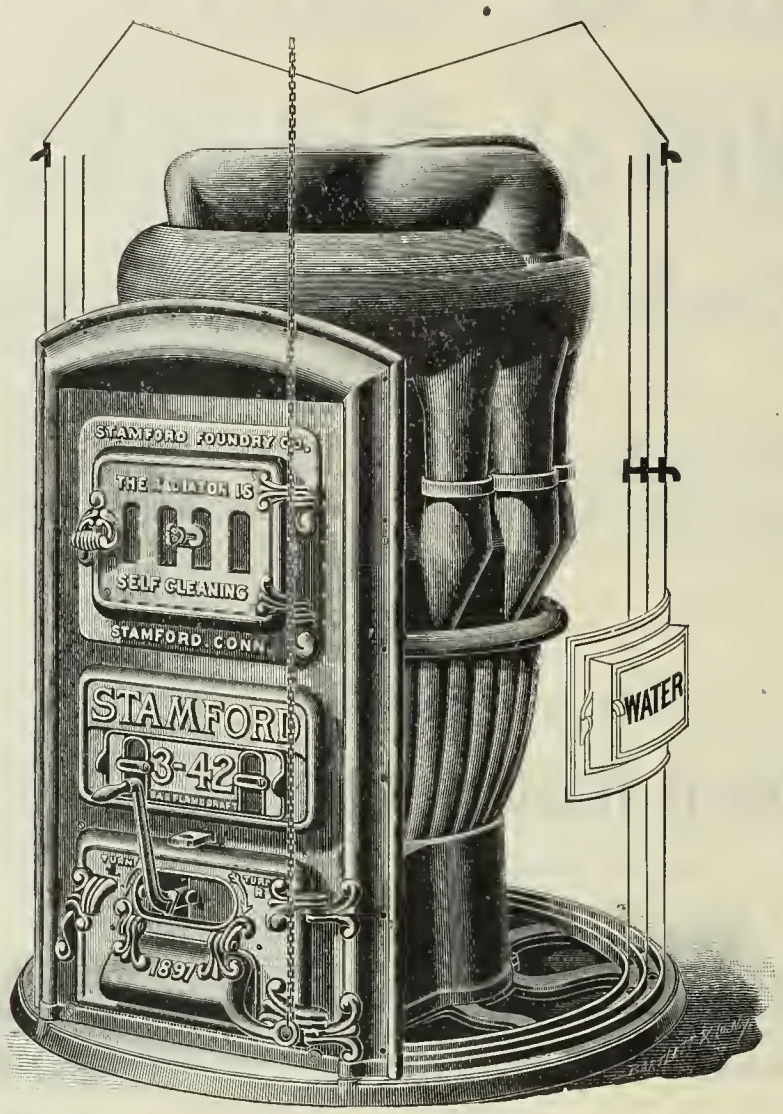
STAMFORD FURNACE.

SERIES 3.

WITH GAS-FLAME FLUE.



A modern warm-air furnace of the highest grade, with an unusually large amount of heating surface. Made with or without hot-water attachment.

The gas-flame flue brings fresh air through front of furnace and introduces it, well heated, immediately over the fire-pot, where it mingles with the gas from the coal and enables it to burn. Most of this gas would otherwise go unburned up the chimney. The quantity of air admitted is easily regulated by slide at front of furnace.

Side view of furnace with hot-water attachment will be shown next week.

STAMFORD FOUNDRY COMPANY,

STAMFORD, CONN.

Send for catalog showing full line of Ranges, Stoves for various purposes, and Furnaces.

REPAIR RECORD

Of Over 600 Akron Air Blast Furnaces

SOLD IN OUR OWN HOME CITY AND COUNTY.

After seven winters' sales and use, less than 5 pounds of castings per furnace have placed **All Of 650 Akron Air Blast Furnaces** *that were sold and are now in constant use in Akron, O. (see our catalogue), in shape for another winter.*

AKRON, O., Nov. 24, 1897.
State of Ohio, Summit County, ss.

Willis Pettitt, bookkeeper for May & Fiebeger, being duly sworn, deposes and says:

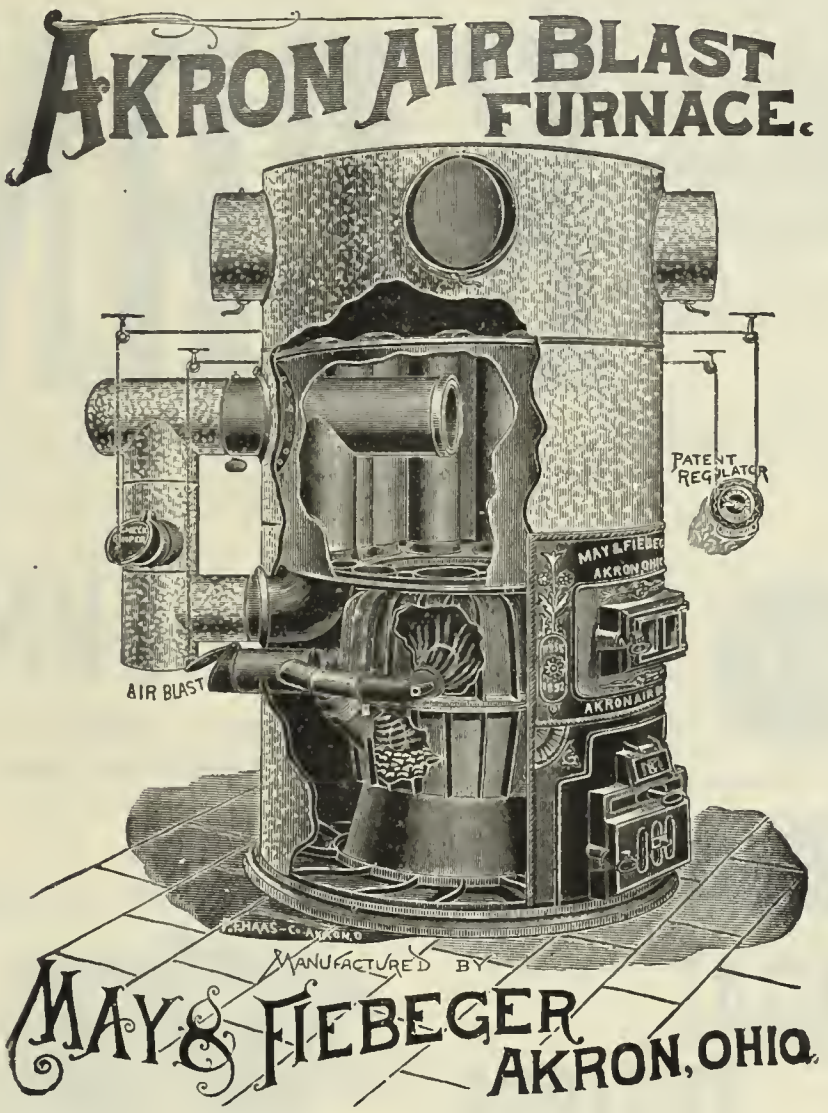
That from the 1st day of March 1897, to the 24th day of November, 1897, there were used in the repairing of all the "AKRON AIR BLAST FURNACES," numbering over six hundred, which have been sold in Akron and Summit County, Onio, during the past seven years, 9 fire pots, 12 grates, and total amount of all other castings, 828 pounds: and further this deponent saith not.

W. E. PETTITT.

Sworn to before me, and subscribed in my presence, by the said Willis Pettitt, this 24th day of November, A. D. 1897.

F. B. THEISS,
Notary Public.

A Splendid Record is Shown by the Above Statement.



It will be of interest to the Hundreds of Agents of the Akron Air Blast Furnace and the Thousands of their Patrons and customers to know the durability of the Akron Air Blast Furnace. With this in view, we have had our bookkeeper, Mr. Willis Pettitt, take the exact amount of all repairs used this season on all Akron Air Blast Furnaces which have been sold and used here in Akron and Summit County during the past seven years of their manufacture. About 90 Akron Air Blast Furnaces have been sold each year from and including 1890. **These 90 first furnaces have had seven winters' use up to May 1st, 1897.** About 90 more have had six winters' use; 90 more have each been used 5–4–3–2 and 1 winter, making a total of over 600 furnaces that have been used from 1 to 7 winters. How many castings were needed to put all of these furnaces in proper shape for this coming winter? From March 1st, 1897, until the present day, Nov. 24, 1897, there have been used to repair all (over 600) Akron Air Blast Furnaces sold in Akron and Summit County, **12 grates, 9 fire pots, all other castings, 828 pounds.** When the fact is taken into consideration that this number includes every pound of casting needed, whether the furnace has been fairly or unfairly used whether the directions were followed or not, this record is wonderful, especially when 85% of these furnaces were used all these years with soft coal as fuel.

Where the construction of a furnace is cheapened in order to effect sales, it adds greatly to the cost of fuel and durability.

THE AKRON AIR BLAST PAYS FOR ITSELF IN FUEL AND REPAIRS SAVED.

One pail of coal in the Akron Air Blast Furnace produces as much heat as 1½ pails in cheaper construction furnaces. Hence the durability and wonderful results in record of our furnace. Send for our Catalogue.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

The publisher of this work is well known for his former succes-ful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

You may miss a contract

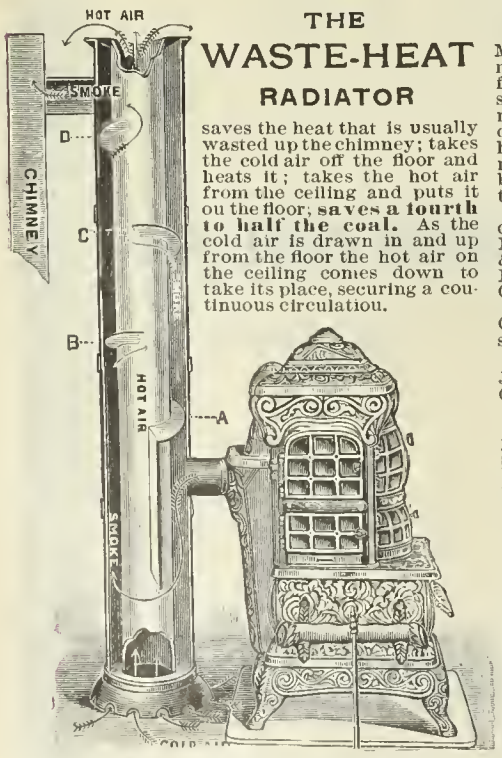
if you are not posted in regard to the merits of the Fowler & Wolfe Improved Wall and Steam-ship Radiator.

This is the Radiator which can be made any number of sections long, and in a variety of forms. It affords 3 ft. of efficient heating surface to 1 sq. ft. of wall surface, takes up very little more room than a base board, is exceedingly handsome in appearance, and may (the surrounding surfaces as well) be dusted with a feather duster. Is it any wonder that Architects and Heating Engineers are specifying it for use in the best contracts?

Drop us a postal and we will send you our illustrated catalogue.

FOWLER & WOLFE MFG. CO.,

664 BOURSE BUILDING, PHILADELPHIA.



The Waste-Heat Radiator Attached to a Stove.

THE
WASTE-HEAT
RADIATOR

saves the heat that is usually wasted up the chimney; takes the cold air off the floor and heats it; takes the hot air from the ceiling and puts it on the floor; **saves a fourth to half the coal.** As the cold air is drawn in and up from the floor the hot air on the ceiling comes down to take its place, securing a continuous circulation.

TO STOVE AND FURNACE DEALERS:

DEAR SIRS:—The Waste-Heat Radiators have been in use in Minnesota and other parts of the Northwest, where the thermometer often registers thirty to forty degrees below zero, for the past three years and have been thoroughly tested, so they are no experiment; but until within the past few months, they have been made only in a limited way, as each one had to be made to order owing to the difference in the height of the collars on different stoves and furnaces, but now we can make them with sliding collars and that they can be adjusted to fit any stove or furnace, therefore can make them in large quantities and do a general business in them.

The following people have used them during the past two or more years, to any of whom we refer: W. W. Rand, Sec'y Minneapolis Gas Light Co., Minneapolis, Minn.; J. C. Oswald & Co., Minneapolis, Minn.; Wm. Cunningham, St. Paul, Minn.; R. A. Lanpher & Co., St. Paul, Minn.; M. M. Gasser Co., Duluth, Minn.; W. W. Schiffman, Duluth, Minn.

The letter printed herewith from Mr. Clifford Hubbell, Cashier of the Columbia National Bank, Buffalo, N. Y., speaks for itself.

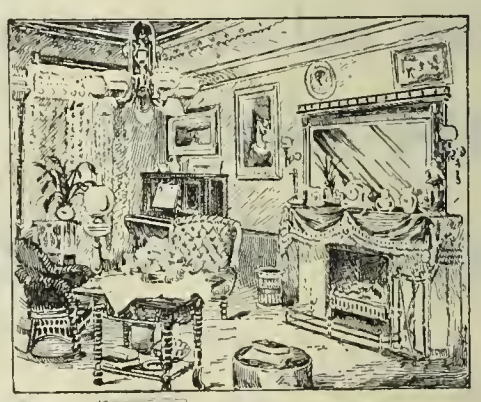
COLUMBIA NATIONAL BANK OF BUFFALO.
JOSIAH JEWETT, President.
CLIFFORD HUBBELL, Cashier.

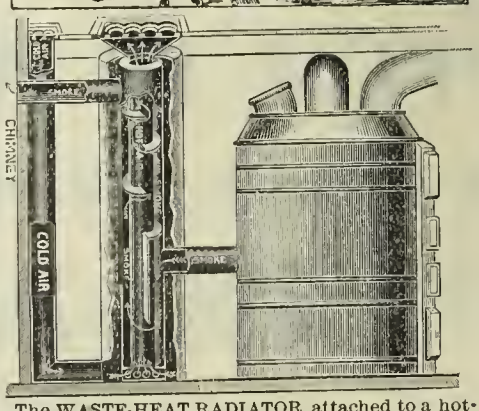
BUFFALO, N. Y.

DEAR SIRS:—Regarding the Waste-Heat Radiator which you placed in my residence, No. 71 Highland Ave., I have to say that it has worked admirably. I believe that the furnace burns 25% less coal now than formerly, and I think that that percentage is a very low estimate. In my mind the greatest advantage is that it draws the cold air from that part of the house where the cold air most accumulates, and makes the temperature in the rooms much more even, conducing thereby to comfort and healthfulness. I know that my wife, being skeptical about patent inventions of any kind, before this was put in, has come to acknowledge that this accomplishes the purposes for which it was purchased: viz., to save a large portion of the waste heat that goes up the chimney, and to save in the amount of coal burned, and make the temperature more even.

Yours respectfully,
CLIFFORD HUBBELL, Cashier.

In order to introduce our Radiators we will send one to any reliable Stove or Furnace Dealer and if he finds it as we represent it then we want him to buy it and take the exclusive sale of them in his city; otherwise to hold it subject to our order. Yours truly,





The WASTE-HEAT RADIATOR attached to a hot-air furnace; attaches to steam and hot-water boilers in the same way.

WASTE-HEAT RADIATOR CO., BUFFALO, N. Y. (Eastern Depot.)

—"I HAVE an account of a big landslide," said the new reporter. "What head shall I put it under?" "Put it under the 'Real Estate Transfers,'" said the snake editor.—*Exchange.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

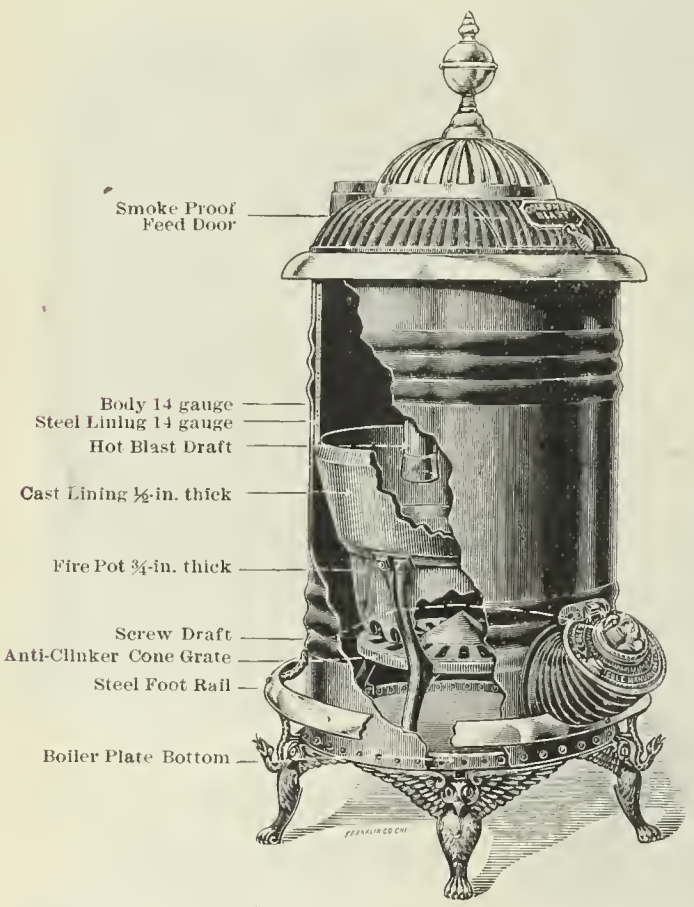
19781 Stoves Sold in 1896.

31415 Stoves Sold in 1897 up to Dec. 1st.

Cole's Air-Tight for Wood and ***Hot Blast for Coal*** are now known everywhere. This steady and phenomenal increase of sales during a panic period is due largely to the popularity and economy of our Hot Blast Coal Heaters.



Shows No. 200 Hot Blast for Coal.

WHY THEY SELL.

They hold fire to beat any stove made.

They economize fuel enough to pay for stove first year.

They are low in price—neat in finish.

Cole's Hot Blast burns the gas half of soft coal wasted in other stoves.

Cole's Air-Tight stays tight.

The all steel, low down, radiating surface, including base, makes a quick, powerful heater.

We guarantee a saving of one-third the fuel.

—How He Made a Saving.—"That mine in Toulumne county is costing me a mint of money," said a local capitalist to one of his employes. "I wish you would figure around and see if you can't make a saving somewhere. If you can I'll raise your salary $50 a month.

"But suppose I can't make a saving of $50 a month?" inquired the young man.

"Well, I've tried to figure it out myself, and I can't find where I can save a cent. If you can you are worth $50 a month more."

"All right, sir, I'll look into it."

The young man went over all the accounts, but he could not find where he could cut down a single expense. Finally it occurred to him that he was drawing $25 a month for acting as secretary of the mining company.

"I've found a place where you can save $25 a month," he informed his employer the next day. "I've cut off that salary of $25 a month we've been paying the secretary for doing nothing."

He got his raise.—*San Francisco Post.*

—THE following curious epitaph is in the graveyard of Lydford Church, Dartmoor, England:

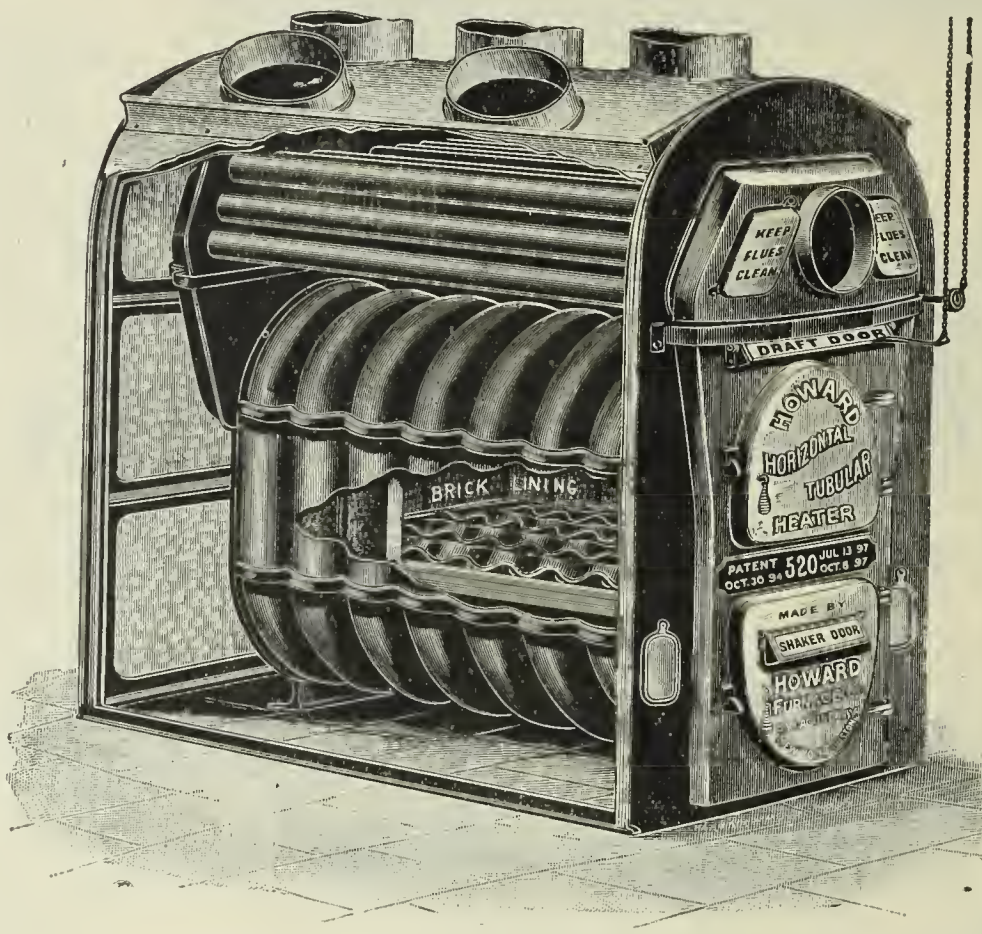
Here lies in horizontal position
the outside Case of
George Routleigh, Watchmaker,
whose abilities in that line were an honor to his profession.
Integrity was the Mainspring and
prudence the Regulator
of all the actions of his life.
Humane, generous and liberal,
his Hand never stopped
till he had relieved distress.
So nicely regulated were all his motions
that he never went wrong
except when set a-going
by people
who did not know his Key.
Even then he was easily
set right again.
He had the art of disposing his time so
well that his hours glided away
in one continual round
of pleasure and delight,
till an unlucky minute put a period to
his existence.
He departed this life
Nov. 14, 1802,
aged 57;
wound up
in the hopes of being taken in hand
by his Maker,
and of being thoroughly cleaned, repaired and set a-going
in the world to come.

—*New York Tribune.*

—"THE Washington Post" tells a story of one of many private secretaries in Washington, who is still new to his honors. One day a newspaper woman, full of business, burst into the office of this secretary's chief. The great man was out. "Can you tell me when he will be in?" she asked. "Really," drawled the clerk, "I haven't an idea." "Well," said the newspaper woman, as she turned to go, "I must say you look it."

a succinct statement

Some manufacturers of furnaces have an idea that they can fool the dealers by talking about a large flue radiator. The proper way to utilize the fire travel is to retard the draft. The impinging properties of the heat are in this way gained. If the fire travel be split up into a number of small flues, immediately after leaving the combustion chamber, a retention of heat is obtained, and five (5) times more heating surface is exposed for generating warm air.



Patented: Oct. 30, 1894. July 13, 1897. Oct. 5, 1897.

does this astonish you?

The truth of this statement is aptly illustrated in the cut, which shows a tubular constructed radiator. It is a self evident fact that if the above radiator were made in one large flue, the heat in its travel to the chimney would be quickened, a less contact surface given and a cooling influence avoided.

The Business Situation.

The opening of December marks the beginning of the stock taking season and a consequent falling off in the volume of business, except in the line of holiday goods, is to be expected. Dealers are reducing their stocks so as not to carry over more goods than necessary into next year's account. Travelers are generally off the road and are engaged in planning their spring campaigns. Nevertheless, at the present time there is considerable business doing, especially in the territory west of the Mississippi, where country merchants are still buying freely. In the South, too, trade, which was delayed by the yellow fever quarantine, is moving with unusual briskness. This accounts for the maintenance of surprisingly large figures in the recent weekly returns of bank clearings, for speculation has been so abnormally dull of late as to constitute a comparatively small factor in the general business account. Last week's clearings throughout the country, in spite of the occurrence of the Thanksgiving holiday, totaled up to considerably over a billion dollars, and were 11 per cent. larger than in the corresponding week of 1896. The demand for seasonable and holiday articles is reported as much better than usual and the setting in of steady cold weather has stimulated the sale of all kinds of winter goods. In general trade, however, the demand has fallen off and is not likely to revive during the balance of the year. There is every prospect for a large spring business and for this desirable consummation merchants and manufacturers are making active preparations. All anticipations for 1898 are decidedly of a hopeful complexion. The approaching meeting of Congress exercises a restrictive influence on stock exchange operations. But the feeling is growing that the President's message will be a peaceful and reassuring document as regards the relations with Spain. As the threatened Cuban complications have been for long among the most effective weapons used by the "bear" traders in their assaults on prices, the growing assurance of a peaceful settlement of the matter has contributed to a return of steadiness and strength in the stock market. Transactions have been, however, on a narrow scale. The iron and metal trades generally are quiet, with no change of importance in the character of business or in prices. Money is still very easy, notwithstanding that some large sums have been loaned to London. Exports of agricultural and manufactured products continue heavy and far exceed the imports. The balance of foreign trade in our favor for November is estimated at about $60,000,000. Collections are generally referred to as satisfactory.

The Solution of a Heating Puzzle.

It is not so very long ago that the first gas radiators came into use, and about the same time lamp heaters and other small kerosene heating stoves were introduced, the principle in all cases being the utilization of a drum of sheet metal, which was placed over the lamp and imparted heat to the room. A good many people were puzzled at the time, and not a few are still puzzled, to understand why the intervention of a sheet metal drum over a flame should alter the heating efficiency of the apparatus. Take, for instance, a lamp stove burning kerosene oil. The flame burns the same as in a lamp, and for every pint of oil consumed a certain number of heat units are generated. It stands to reason that this heat must go off into the apartment in which the lamp is placed, and it would seem that the warming effect of the lamp would be just as great without a sheet metal drum as with it. We speak of the matter in this place to call attention to an article that appears in our Letter Box department in this issue, under the title of "The Benefit of a Radiator Over a Flame." A correspondent asked the simple question as to what effect an oven placed over a burner will have upon heating the room. We have obtained an answer, and thorough discussion of this question from Prof. J. H. Kinealy, the well-known writer on heating topics, and we feel assured that all our readers who are in any way concerned in this problem will be very much interested and perhaps benefited by reading the clear exposition given by Professor Kinealy. He treats the problem very simply and shows just why the practical effect of an oven or radiator of this kind is important. The actual heat from the flame is neither increased nor decreased, but its practical efficiency is decidedly augmented by interposing a drum which enables the fire, in this case an oil flame, to dispense its heat by radiation instead of solely by convection, and it is due to this transmission by radiation that the apartment appears to be better heated. In such a case the temperature of the air is perhaps not so much increased, or no more influenced, than would be the case with an uncovered flame, as might be tested by a thermometer properly shielded from the source of heat. In the presence of the radiant heat from the drum, however, an occupant of the room is more comfortable than if the radiant heat was absent and a higher air temperature prevailed.

Orders were received at Fostoria, Ohio, last week from the headquarters of the Northwestern Ohio Gas Company, at Toledo, that the natural gas would be turned from the Fostoria lines on December 31 next. It is understood that the officials of the company fear that their supply of gas next year will not be sufficient to meet the demand; owing to the waste that has been going on. Grave fears are entertained that the Ohio Gas field is nearly exhausted.

THE LETTER BOX.

The Benefit of a Radiator Over a Flame.

From G. S, Jackson, Mich.—Suppose a burner on a gasoline or oil stove is lighted to warm a room, will the same amount of flame make more heat in the room by placing the oven over the burner, and, if so, why?

Answer.—We submitted this inquiry to Professor J. H. Kinealy, St. Louis, who comments upon it as follows: This is an extremely interesting and important question. But in order to discuss it we must suppose that when the oven is put on the stove nothing else is changed, and that exactly the same amount of gasoline or oil is burned per hour with the oven on as was burned when it was not on. The amount of heat generated per hour by a flame depends only upon the nature of the substance burned and the weight of it burned per hour. For every pound of gasoline or oil burned in the stove there is generated a certain fixed amount of heat, which is entirely independent of whether the oven is on or off, and which depends only upon the quality of the gasoline or oil. All of the heat generated in the room per hour by the stove is used in heating the room, whether the oven is on or off. But the part that is effectively utilized is very different in the two cases.

When the oven is not on the stove the room is warmed entirely by convection, or currents of air set up in the room. The hot products of combustion rise from the flame, and at once mingle and mix with part of the air, which is heated. This hot air and the products of combustion rise to the top of the room and spread over the ceiling. The air of the room is hottest near the ceiling, and is coolest near the floor. The hot air near the ceiling comes in contact with the walls of the room, is cooled, and falls along the walls to the floor. It flows then along the floor to the stove, and then is heated and rises to the ceiling again. Thus there are upward currents of hot air at the stove, currents along the ceiling to the walls, downward currents along the walls to the floor, and currents along the floor to the stove. A hot gas or a hot flame has an exceedingly small radiating power, so that objects in the room will derive almost no heat from the stove unless the hot air comes in contact with them. And unless the amount of heat generated by the stove is quite large, the whole air in the room will not be circulated much. A part of the heat generated will be concentrated at the ceiling, where it is of little use in heating objects in the room, and a part will be brought directly to the cool walls, through which it will pass to the cool air on the outside.

When the oven is on the stove the hot products of combustion from the flame come directly in contact with it and give to it a large part of their heat before mixing with the air and rising to the ceiling. The oven acts as a reservoir of heat, catching it from the flame and storing it up before it can be carried to the ceiling and the cold walls. As the oven becomes hot it gives off its heat by radiation, and the bodies in the room that are nearest to the oven receive the greatest amount of the radiated heat. If there are many people or objects in the room close to the stove they will receive almost all of the radiated heat from the oven, and the cool walls will receive very little. The air in the room receives almost none of the radiated heat from the oven, as radiant heat passes through air with almost no loss. But some of the air comes in contact with the hot oven and is heated. This warm air mixes with the products of combustion when they leave the oven and rises to the ceiling, then flows to the walls, and then falls to the floor. Thus, when the oven is on, a small part of the heat generated is carried to the ceiling and walls by convection currents, but a large part of the heat is first stored up in the oven, and is then radiated to objects near the stove. When these objects are heated they give heat to the cool walls.

To sum up, then: When the oven is not on almost all of the heat is carried away from the stove to the ceiling, and then to the walls, through which it passes and is lost. But when the oven is on a large part of the heat is received by it, and then most of it is given to the objects in the room, and they give a part only of what they receive to the cool walls.

When the oven is on the occupants get more benefit from the heat generated than they do when it is off.

Heating by Steam to a High Temperature.

From J. R. R., Brooklyn, N. Y.—Please answer the following in *The Metal Worker:* How many feet of radiation will it require and under what pressure should a steam boiler be run to maintain a temperature of 215 degrees in a warming box of the following size and construction: The box to be 19 feet long, 3 feet wide and 6 feet high, built of 1-inch rough boards with close joints; the inside of the box to be lined with IC bright tin; the coil to lie on bottom of box and to be built of 1-inch pipe. The box will be in a room where the temperature is about 50 degrees in cold weather, and will have sliding doors on the front. Should the box have a cold air supply, and of what size? Would I get any better results by putting the coil upright along the wall instead of on the bottom of the box? Is it possible to maintain a temperature of 215 degrees with hot water circulation? I have a box of the above size and construction in which I have a coil of 1-inch pipe containing 140 feet of radiation, 1-inch pipe flow and 1½ inch return. A hot water boiler is set on the floor below and has a capacity of 300 square feet of radiation. I have closed the expansion tank and run the boiler under pressure. Steam forms in the radiator at times and stops circulation, forcing the water up to the expansion tank, which shows a pressure of 10 pounds. I have air valves to relieve it, but I can only get 135 degrees of temperature in the box. Can you offer any remedy?

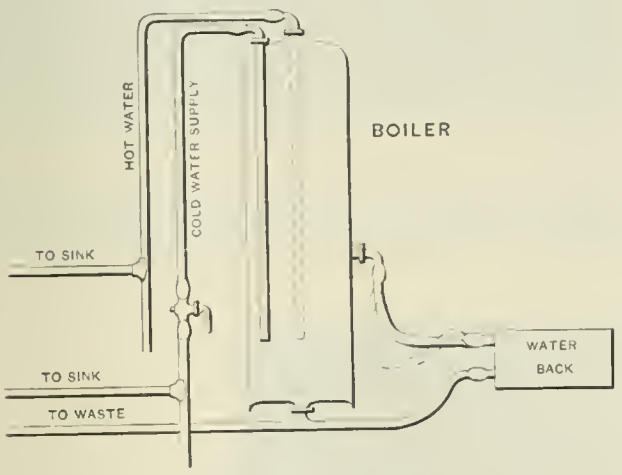
Answer.—The successful heating of a room or oven depends very much upon the use for which it is made. If the material to be subjected to heat is bulky and very moist a much larger amount of heating surface and a higher steam pressure is required than for the mere warming of goods that have no moisture to be evaporated. As our correspondent has not enlightened us on this point we will assume a medium condition, which may be varied to suit the actual case. We also surmise that the sliding doors are on the long side of the room, reaching to or near the top. We apprehend that very little ventilation will be needed, as our experience with this class of drying rooms is that the doors are never tight and that the repeated opening and closing of several such doors in a long narrow room tends very much to ventilate to its full requirement. The room, containing 342 cubic feet of space, should have 200 feet, more or less, of 1 inch pipe, to consist, for best effect, of a five-branch tee coil entirely around the room and running past the doors with the hooks attached to the door posts, if that is the construction. Otherwise the coil may be placed on the back and ends of the room and the balance placed flat a few inches above the floor, and next to the doors. With such a coil and a fairly tight room there should be no difficulty in maintaining a temperature of 215 degrees or more with 40 pounds of steam in the boiler and a clear circulation. The temperature of the steam in the boiler at 40 pounds pressure is 287 degrees F, and the temperature required

in the room is 215 degrees, so that you have a margin of only 72 degrees in which to transfer the boiler temperature to the air temperature in the room, through some length of feed pipe and the coils. This is why the large amount of pipe surface in the room is needed. As to the hot water arrangement, we cannot give much encouragement. Ten pounds water pressure could only give a temperature in the circulating water of 240 degrees, only 25 degrees above the required temperature in the room. This, with the impeded circulation caused by generation of steam and small size of the pipes and connections, accounts for our correspondent's disappointment. A closed system of hot water circulation under the pressure of the city water works, with the above amount of pipe coils and large, easily circulating feed and return pipe, will give about the same results as with steam at the same pressure.

Why Water Did Not Heat.

From F. B., New York City.—I submit herewith a sketch of a boiler and its connection which I found, and which did not work satisfactorily. I am a young man and send this in to show how little some people care about their work, and hope that you will present it in *The Metal Worker* to show workmen the mistakes. The dotted lines show the arrangement of the piping as it was found, and also the location of the delivery tube in the boiler. The solid lines show how the job is connected at the present time, and I am pleased to say that it works satisfactorily.

Note.—We are glad to hear from any young man who takes an interest in doing work in a proper manner. The



Why Water Did Not Heat.

job as found shows the delivery tube connected with the hot water service pipe at center of the boiler and the cold water supply connected at the top; consequently, unless all the water in the boiler was hot there would be no likelihood of hot water being drawn from the boiler, and even under such conditions it would be possible for the cold water to make a short circuit direct to the delivery tube and out. It is not strange that the service was unsatisfactory. The delivery tube should always be connected with the opening to the boiler that is nearest to the outside. The piping in the water back, as shown by the dotted line, had a very effective trap in it which would seriously interfere with circulation. It is well to provide enough extra length in the pipe to allow for a free expansion and contraction, but there should not be such a quantity as to permit the pipe to sag and form a trap. Our correspondent has done the right thing in connecting the pipe so as to avoid a trap.

Right and Left Fittings.

From J. F. C., Providence, R. I.—I notice the article on right and left fittings in the Letter Box of November 20, and as the fittings shown are designated differently from what is our custom I inclose a circular showing cuts of fittings that are described as having what we call right and left hand side openings, so that I may learn which is right. In all the printed lists that I have seen the fittings are designated the reverse of those shown in *The Metal Worker*.

Note.—This correspondent brings up an interesting point. We had previously conferred with some of the largest manufacturers and dealers in soil pipe fittings, and while all did not agree we assumed that the houses doing the largest business in this particular line were the best qualified to decide this point. On the receipt of the letter of this correspondent we investigated further, and find that the proper method of deciding right and left fittings is still an undecided question in the trade. It is not an uncommon thing for one supply house in sending an order to another to accompany the order with a sketch so as to avoid any possibility of mistake. In other instances the orders will read "the reverse of the cut shown in your catalogue." The decision as to whether a fitting is right or left depends upon the position occupied by the person looking at it. It is assumed by those who entertain the same opinion as our correspondent that the proper place to look at the fitting is from the same position that it would be necessary to look at it if it were in place in a building, and this would be the reverse of the position mentioned in the article in *The Metal Worker* referred to.

Battery for Electric Lights.

From J. K., Kentucky.—Could a 20 or 30 light (incandescent) dynamo be run by cells or batteries, and how many lights could be obtained by a dynamo run in this way—I mean if the batteries were large? I suppose you could not make the light without the dynamo. We have the dynamo and would like to use cell batteries to run it, as steam is costly and troublesome for 12 lights, which is all we need.

Answer.—An electric generator cannot be run directly by a battery. The battery must operate a dynamo motor and the motor may drive the generator. By this arrangement 50 per cent. of the lighting power of the battery is lost; so that if a battery is to be used at all it should be in direct conection with the lamps. If your dynamo is a generator a small gasoline engine will be the best and cheapest method of operating the generator. For 20 incandescent lamps, say of 16 candle power each, you will need 2 horse-power. With a gasoline engine it will cost about 2 cents per hour for the fuel, and but a few minutes per day for its care. If you use a good form of battery for direct lighting you will need not less than 80 cells for 20 lights, the lamps to be made for low voltage.

Tight Serviceable Joints.

From Paterson, N. J.—Will *The Metal Worker* please inform me if it is proper to use a rubber washer on a coupling under the ground? I have been informed that it is not, because in time, it is said, the washer will rot out. I would also like to know if when a coupling is screwed up tight and water is turned on it is found to sweat a little between the coupling and the solder, it is liable in time to cause any noticeable trouble? This last trouble has occurred several times, and I have formed the opinion that it would make up tight, as I think the sweating is caused by contraction in the pipe owing to the cold water being turned on.

Note.—It has generally been considered that all joints under the ground should be made without the use of washers of any kind, as the best material is liable to rot out in time and permit leakage. If the leak in the second case presented is in the coupling proper it should be screwed up tight enough, so that the leaking cannot occur. If there is a leak through the solder it shows that the material on which the joint has been wiped has not been properly tinned and prepared before wiping, and it also shows that either the solder used in the wiping is too coarse for the work or the joint has not been wiped quickly enough; consequently the joint is not as solid as it should be. If the water seen is due to condensation it would show all along the pipe that is exposed to the air.

Address Wanted.

From M., Confluence, Pa.—Will some of the readers of *The Metal Worker* please inform me who makes the Champion rat trap?

Machine Molding Without Stripping Plates.*

BY E. H. MUMFORD, PLAINFIELD, N. J.

Molding machines may be classed under three heads: 1. Machines which only ram the molds, and, when the ramming is done by means of a side lever by hand, are generally called "squeezers." 2. Machines which only draw the patterns, the ramming being accomplished by the usual hand methods. 3. Machines which both ram the molds and draw the patterns, ramming either by a hand pulled lever or by fluid pressure on piston or plunger and drawing the patterns through a plate called a "stripping plate" or "drop plate"—till recently the usual method—or, without the use of this plate, fitting everywhere to pattern outline at the parting surface, the patterns being effectively machine guided in either case.

It is to the third class that the machine which is used to illustrate the subject of this paper belongs, and which would seem to have enough that is novel in the application of machinery to the foundry to merit the attention of the society. At the risk of appearing pedantic, but with a view to developing an appreciation of the true function of the method of pattern drawing used in this machine, attention is called to the following sectional views of molds and ways of drawing patterns occurring in machine molding. Fig. 1 shows an ordinary "gate" of fitting patterns being drawn from the drag or nowel part of the mold by means of a spike and rapper wielded by the molder's hand after cope and drag have been rammed together on a "squeezer" and cope has been removed. Frequently the pernicious "swab" is used to soak and so strengthen joint outlines of the sand before drawing patterns, in such cases as this. In this case, before cope is lifted these patterns must be vigorously rapped through the cope; an amount depending (and so does the size of the casting) upon the mood and strength of the molder.

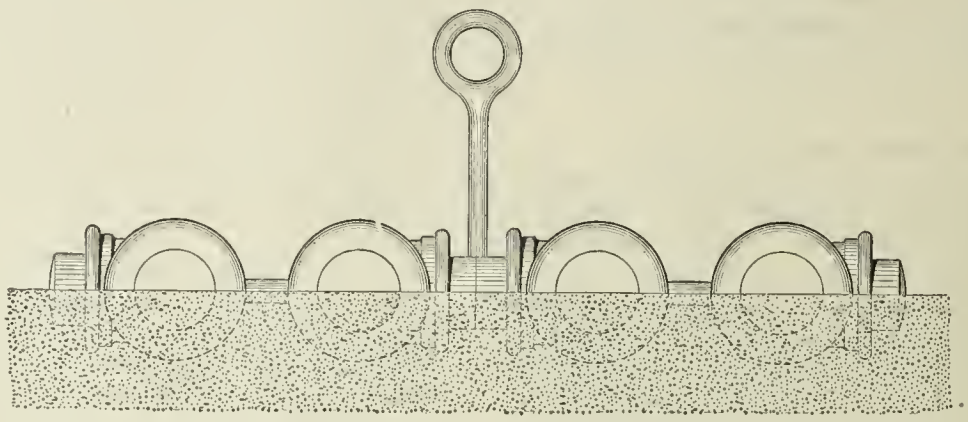


Fig. 1.

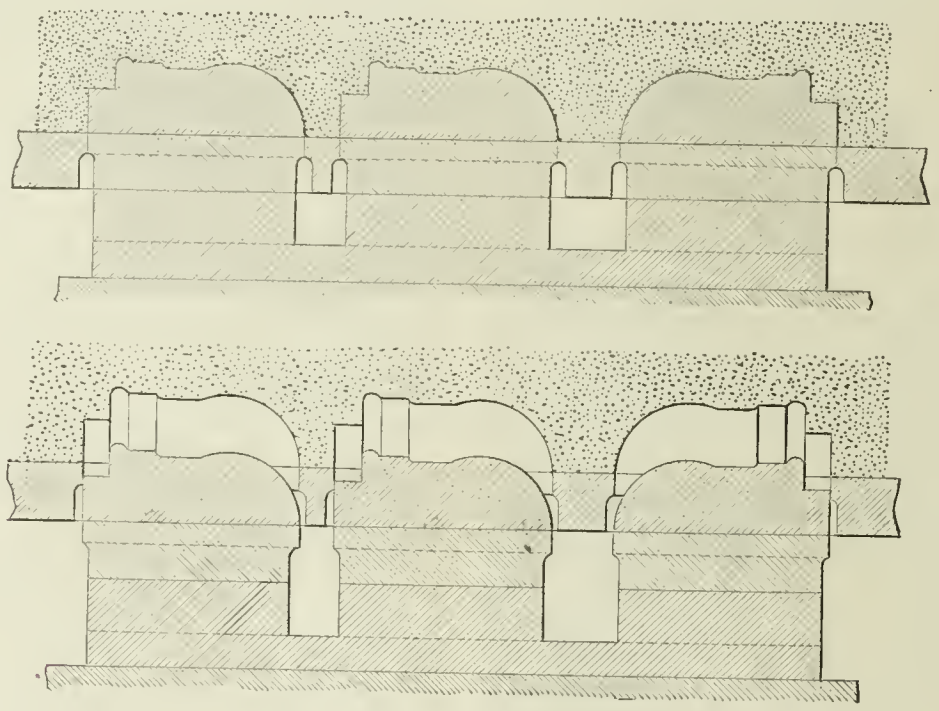

Fig. 2.

Fig. 2 shows the stripping or drop plate method of drawing patterns. In this method the patterns are not rapped at all and are drawn in a practically straight line so that the mold is absolutely pattern size. The stripping plate is fitted accurately to every outline at the joint surface of the patterns, obviously at considerable expense, and, of course, at the instant of drawing the patterns supports the joint surface of the mold entirely. This is at first sight an ideal method of drawing patterns, and it has for years been the only method practiced on machines. It has two disadvantages. The patterns are separated from the stripping plate by the necessary joint fissure between the two. Fine sand continually falls into this and, adhering to the joint surfaces more or less, grinds the fissure wider. This leads to a gradual reduction of size of patterns on vertical surfaces and a widening of the joint fissure often to such an extent that wire edges are formed on the mold, causing, on fine work, "crushing" and consequently dirty joints. A nicely fitted but worn plate of 24 pieces which had cost, at shop expense only, $250, was recently replaced by a plate of 28 pieces, fitted ready for the machine under the new system about to be described for not more than $25. The stripping plate method has another drawback, not always appreciated, probably because accepted as inevitable. Stripping plate patterns are not rapped, and there frequently occur on surface of patterns, remote from the action of the stripping plate, rectangular corners just as important to mold sharply as those at the parting line. Such corners have either to be filletted or "stooled" in stripping plate work, and neither method often is practicable. When the entire pattern and plate are vibrated so that the corners where the pattern joins the plate draw perfectly, as they do in the machine to be described, it is obvious that similar corners anywhere on pattern surface will draw equally well.

The vibrating of patterns, or rather of molds, during the operation of drawing the patterns possesses little of novelty. Ever since a bench molder's neighbor first rapped the bench while he lifted a cope or drew a pat-

*Presented at the New York meeting of the American Society of Mechanical Engineers, Nov. 30-Dec. 3, 1897.

tern, the thing has been done in one way or another. In fact, machines are now and then found on the market in which a device like a ratchet or other mechanical means

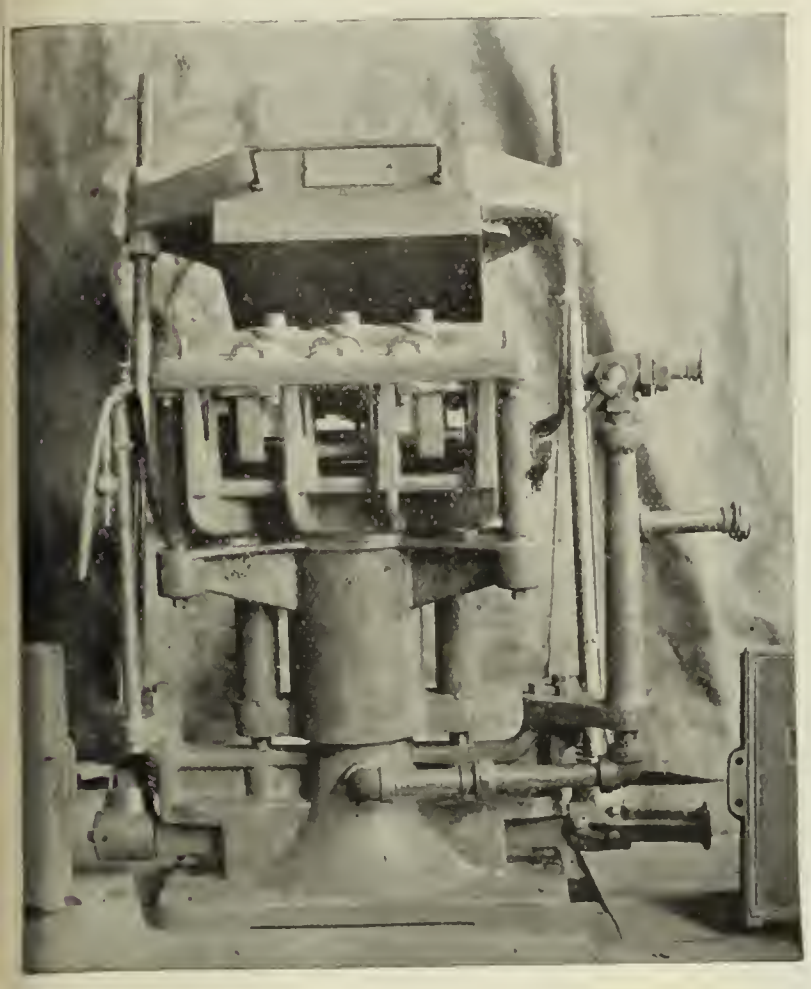

Fig. 3.

for jarring the machine structure during pattern drawing renders the working of easy patterns without stripping plates possible. The idea of applying a power driven

patents to Harris Tabor, and the following figures will serve to illustrate the mechanism. Figs. 3 and 4 show the general appearance of the machine from the side on which the operator stands. Fig. 3 shows the machine ready to receive the flask, the patterns being up ready for molding. Fig. 4 shows the machine after patterns have been drawn and flask lifted off.

Briefly, the operation of the machine is as follows: The ramming head shown thrown back at the top of the machine is drawn into a vertical position after flask has been placed and filled with sand. The three-way cock shown at the extreme right is then quickly opened, admitting compressed air of 70 to 80 pounds pressure to the inverted cylinder shown at the center of the cut. The cylinder with the entire upper portion of the machine is thus driven forcibly up against the ramming head, flask, sand and all. Often a single blow suffices to ram the mold—often the blow is quickly repeated, according to the demands of the particular mold in hand. Gravity returns the machine to its original position, as the three-way cock opens to exhaust. After pushing the ramming head back and cutting sprue, if the half mold is a cope, the operator seizes the lever shown just inside the three-way cock at the right, and, drawing it forward and down, raises the outer frame of the top of machine containing the flask pins, with flask and sand thereon, away from the patterns —thus drawing them from the sand. Just as he seizes the pattern drawing lever with his right hand he presses with his left on the head of a compression valve shown at the left side of top of machine, thus admitting air to the pneumatic vibrator already referred to.

Fig. 5, a rear view of the machine, shows, at the top center, with its inlet hose hanging to it, this vibrator, which is shown in section in Fig. 6. It consists simply of a double acting elongated piston having a stroke of about 5-16 inch in a valveless cylinder, and impacting upon hardened anvils at either end at the estimated rate of 5000 blows per minute. The method of communicating the rapid, yet small oscillations of the vibrator to the patterns and yet keeping them from being transmitted to the rest of the mechanism is this: A frame, called a vibrator frame, to which the pneumatic vibrator is bolted and keyed is shown in Fig. 7. To this frame the plate carrying the patterns often, in cases of patterns having irregular parting lines forming one and the same casting with the patterns, is fastened by the four machine screws, the small tapped holes for which are shown in the corners. In fact, in changing patterns the process consists of simply removing these four machine screws, taking up the

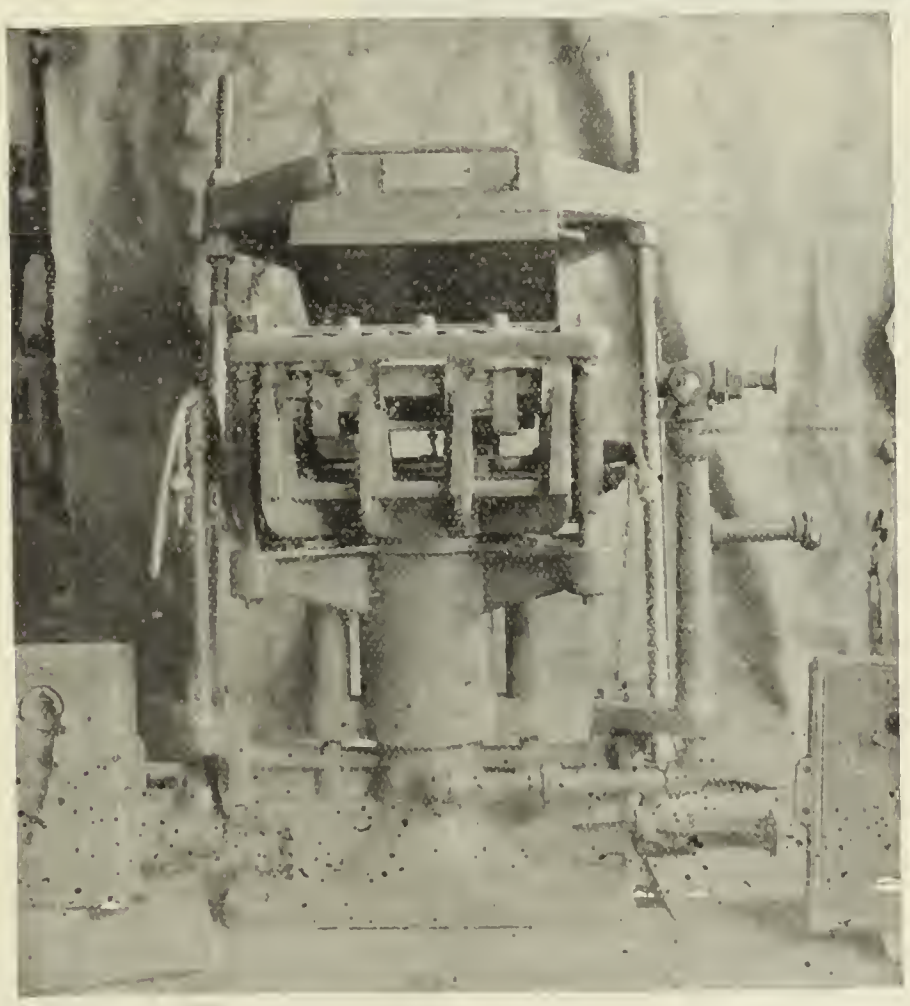

Fig 4.

vibrator directly to the plate carrying the patterns to thus vibrate them independently of other parts of the machine and the flask and sand has been the subject of the issue of

pattern plate and screwing to the vibrator frame the new pattern plate. The vibrator frame itself is secured to the machine structure by the four larger bolts, the holes for

which are shown in the inner corners. These bolts are, as shown in Fig. 9, surrounded by thick bushings. These bushings are elastic to such a degree as to absorb the sharp vibrations of vibrator frame and patterns, while so firm and well fitted as to hold patterns accurately to their position. The action of the vibrator is such as to give to the entire pattern surface an exceedingly violent shiver,

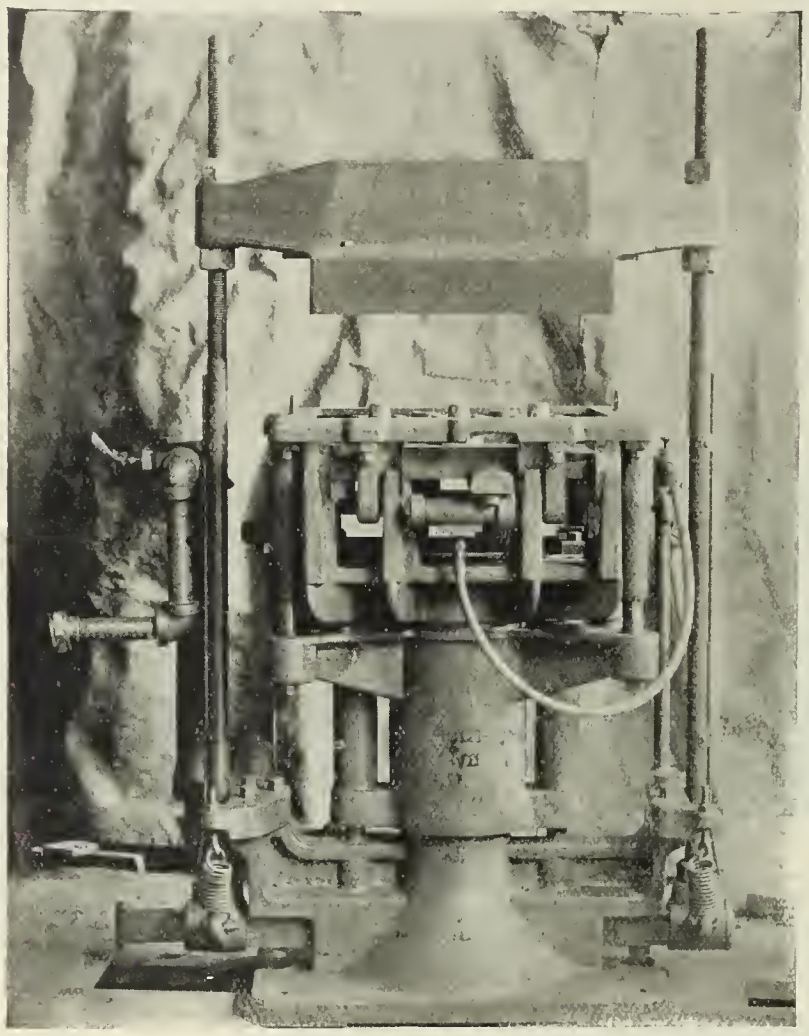

Fig. 5.

making it impossible that any sand should adhere to this surface, while the magnitude of the actual movement of the pattern is so slight that it is found to fill the mold so completely that it is impracticable to draw it a second time without rapping. Yet so truly are the patterns held, and so little disturbed from their original position, that it is perfectly practicable to return patterns to a mold

working as the simpler type, in which the flasks come off in the same way they go on.

Fig. 8 shows a set of patterns as they are ordinarily fitted to plates for this machine. Round holes will be noticed at places in the plate surface. These are openings for the insertion of what are called "stools." When it is found necessary to support the sand surface at any point,

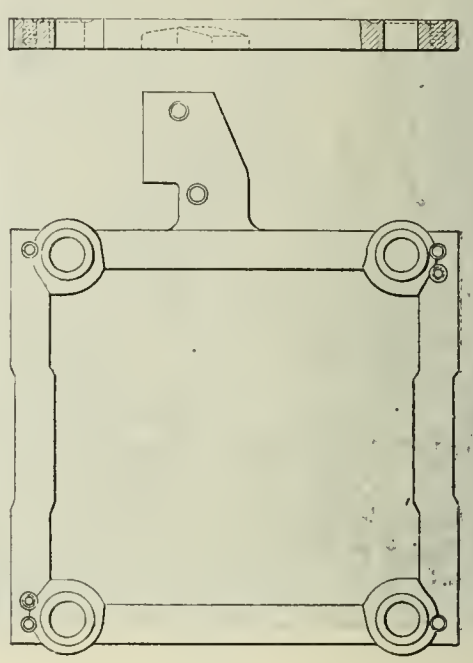

Fig 7.

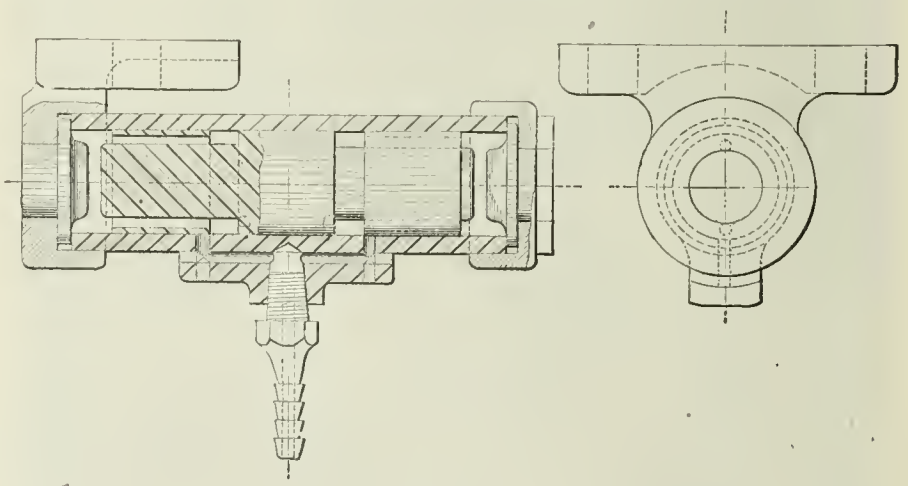

Fig. 6.

having the finest ornamental surface in the ordinary practice of "printing back." In cases where deep pockets of hanging sand occur, which cannot be held during lifting off and rolling over, machines are arranged to roll the flask over in their operation and draw the patterns up under the influence of the pneumatic vibrator, though, owing to the time consumed in the rolling over process (and each operation counts in seconds on a molding machine), this style of machine is not usually as rapid in its

or generally, round holes are drilled through either plate or pattern surface and loose cylindrical pieces are dropped into these holes, their upper end surfaces being flush with the plate or pattern surface and their lower ends resting on the plate called, from this use, a stool plate. This plate appears in Fig. 9 at A, and is hung solidly by the brackets shown at B from the frame which carries the flasks, so that it has the same upward motion as the flasks, and the upper ends of the stools remain in contact with the sand of the mold until same is lifted from machine. Fig. 9, showing a vertical section through a machine, will make perfectly clear the position and action of these stools. As illustrating the importance of being able to work without stripping plates on a line of work which is much more extended than that possible with them, we may say that a machinist with a drill press, supplied with

split patterns and planed pattern plates, has matched and fixed five sets of from four to eight pieces in a day, and wooden patterns fitted for temporary use in the same way

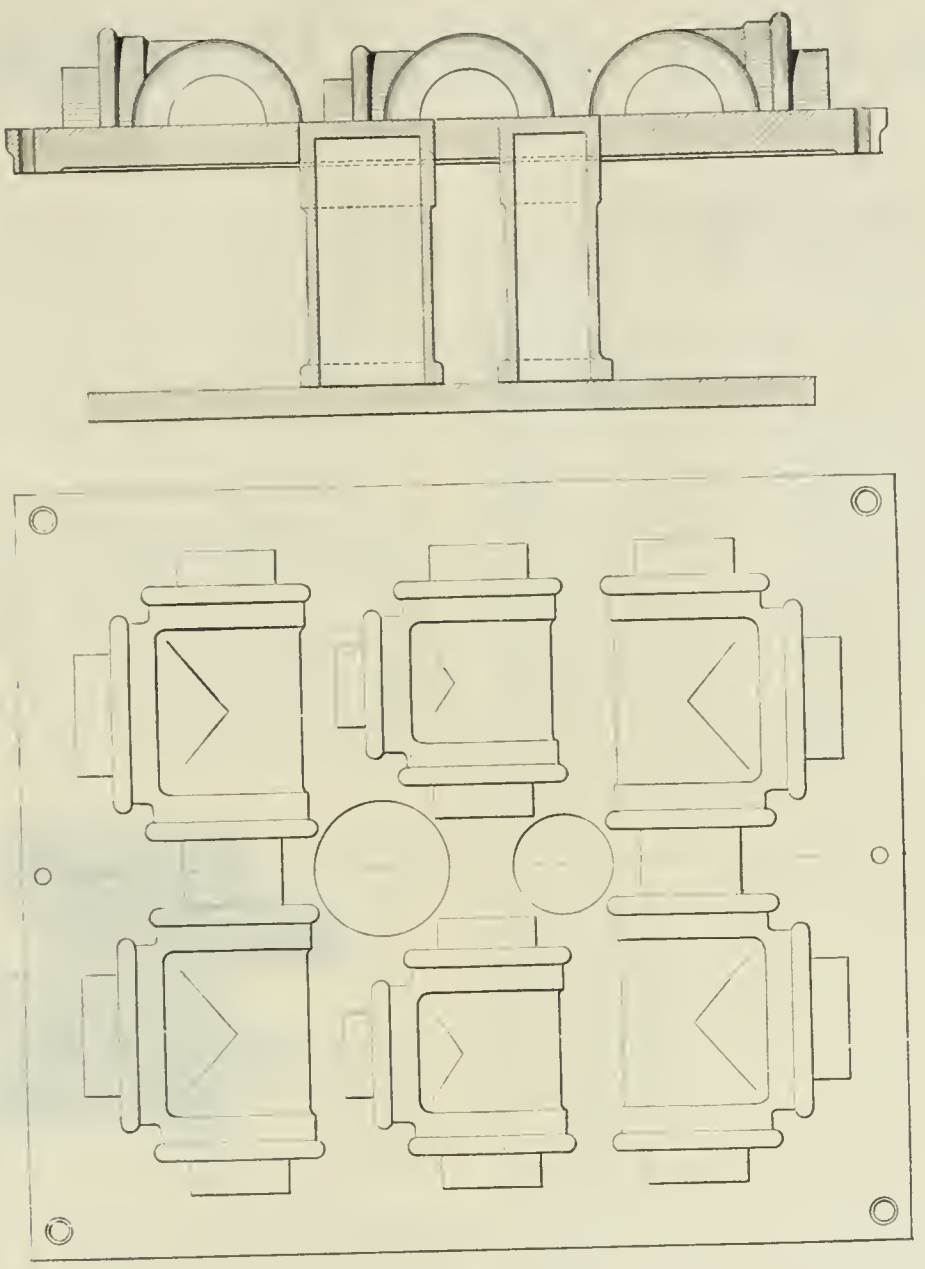

Fig. 8.

are of frequent occurrence when it is not thought wise to go to the expense of metal patterns on account of the relatively small number of castings to be made from them.

It is not, perhaps, too much to say that pattern expense is not the final evil of the costly and not durable stripping plate patterns.

A meeting of some of the principal railway officials of the country was held this week at the office of the Interstate Commerce Commission in Washington, to consider the question of the adoption of a universal system of car coupling. At present there are a great many couplers in use on the different railroads of the country, many of which are in themselves all that could be required, but the use of so many different devices is found to be confusing, and in some instances dangerous to the lives of railroad men who are unfamiliar with them. A bill was introduced at the last session of Congress directing the Interstate Commerce Commission to bring about an adjustment of the difficulty, and in accordance therewith the meeting was held.

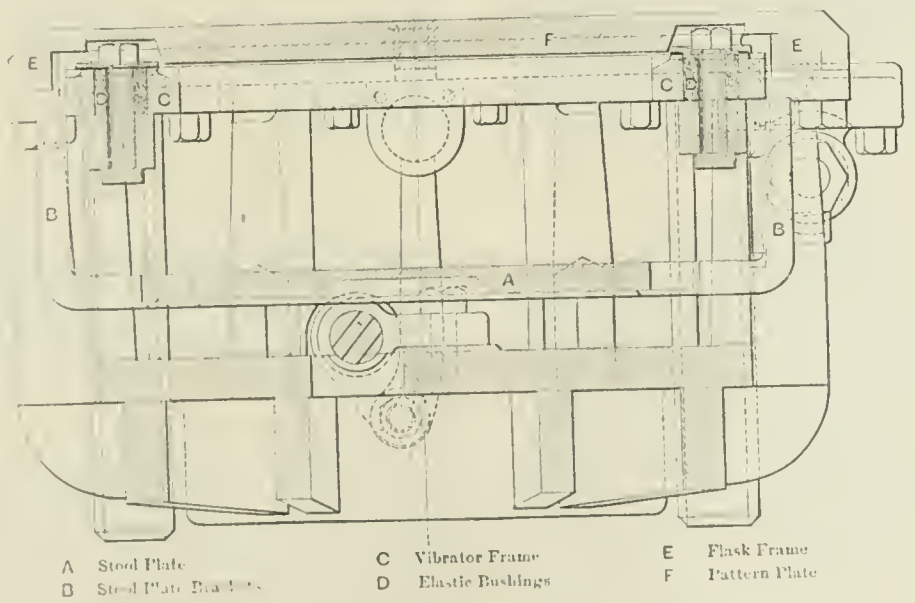

Fig. 9.

HEATING AND PLUMBING.

George Swift.

George Swift, one of Paterson's oldest citizens and a man highly esteemed by every one, died November 24, at his home, 197 Ellison street, Paterson, N. J. Mr. Swift was born in England nearly 78 years ago, and when still a young man he came to America and settled in Paterson, where he served his time with the late William Cundell, a prominent tinsmith of bygone years, and then went to the establishment of Horatio Moses, where he became the foreman of the shop. When the news of the wonderful gold discoveries in California in 1849 agitated the whole country young Swift left his work and left for the gold fields. Fourteen months later he returned—a step that he said he always regretted. When Mr. Swift left Mr. Moses' employ his place as foreman was taken by E. B. King. Soon after his return he and Mr. King formed a partnership under the name of E. B. King & Co., plumbers—a partnership that lasted for 38 years. After the late Mr. King retired from the business it was conducted by Mr. Swift up to two years ago, when he sold out to Howell & Tattersall, and they lately moved from the old stand to Washington street. He was a prominent member of the Methodist Church and an Odd Fellow. He was married three times and is survived by a widow and two daughters.

Plumbers' Certificates.

The members of the Board of Plumbing Examiners of the city of Peoria, Ill., have finally completed the making out, signing and sealing of the certificates for both master and journeymen plumbers of the city. The certificates have been issued to the men who lately passed the examinations, and from this time on all plumbers, either master or journeymen, must have their certificates handy so as to be prepared in case they should be called upon. The following is a list of the successful plumbers of both classes :

Master Plumbers.—Michael Conlon, Edward O'Connor, Daniel O'Connor, William W. Murphy, John A. Nailon, Andrew O'Neill, John W. Simpson, Charles W. O'Neill, Frank McLoughlin, Sr., Rud G. Trefzger, Edward H. Donohue, Fred. F. Studer, Arthur Antcliff, Richard Errion, James McGlinn, Christian Klingle.

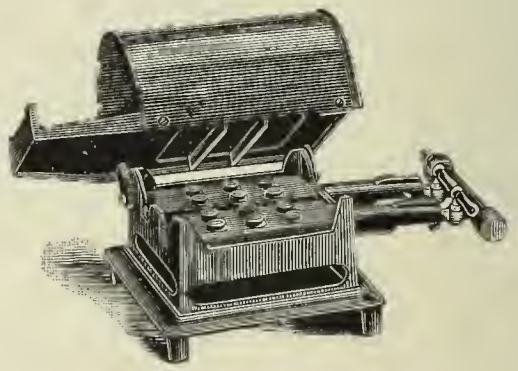
Journeymen Plumbers. — Thomas McQuellion, John Gaelder, William O'Connor, Samuel A. Doyle, Fred J. Kraft, Michael T. Sullivan, Peter Kelley, Frank McCormick, Adolph Prohmer, John Loock, Frank B. Babbitt, Thomas Buckley, Mark Martin, James B. Donahue, John W. Kneer, Michael Kavanaugh, George Kramer, John P. Ryan, Rudolph Klingle, John B. Rose, Patrick Guheen, John O'Connell, John Noonan, Thomas R. O'Brien, Thos. J. Cody, Fred Herder, Patrick Kelley, Samuel B. Dooley, John Smith, James F. Smith, James B. Campbell, Thomas O'Connor, William F. Smith, Milton F. Hitchcock and Charles Murphy.

A New Business Building.

Hunting, Weeks & Corcoran have nearly completed their handsome new brick block at 26 Factory street, Watertown, N. Y., and the firm will occupy it the first of the coming year. The lot is 75 x 225, extending from the railroad switch on the one side and fronting on Factory street. The office is on the ground floor, plate glass windows facing the street. It is separated by a glass partition from the rear portion of the floor, which will be used as a showroom, where the latest designs in plumbing fixtures will be shown under water pressure. The first floor is very strongly built and will hold 1000 pounds to the square foot, giving 20,000 square feet of floor surface. An hydraulic elevator has been put in. In the rear of this floor a large stock of sheet iron and American tin plates will be kept and a stock of the Cookly K imported plates for making cheese vats. The second floor will be used for bins for fittings, over 3000 different sizes being carried, also valves and brass and nickel plumbers' goods, engineering supplies, rubber hose and packings. The third floor will be used for the storing and display of tin and sheet iron household utensils and tinners' supplies. The firm use two carloads of stove elbows alone in a season, which will show the extent of this part of the business. In the basement is located the heater, hot water being used to warm the building, and bins for soil pipe fittings, and large goods not conveniently kept in other parts of the building will also be stored there. At the rear of the lot and close to the switch there has been erected a pipe storehouse very conveniently located. The firm deal largely in this line. There is also put up near there a power pipe machine, cutting and threading pipe 2½ to 8 inches, which will be run by electricity. Altogether they will carry a most complete line of supplies for plumbers, tinners and mills and house furnishing materials.

The Orchard Gas Soldering Furnace.

In the accompanying illustration we show the Orchard gas soldering furnace, which is being put on the market by Orchard & Woodworth, 14 Frankfort street, New York City. The furnace is made single for the use of one iron and double for heating two soldering coppers in three different sizes, with 8, 12 and 16 gas burning orifices. A feature of the burner which contributes to its efficiency is the construction which furnishes a central draft. The gas is admitted through the usual mixing device into a chamber, from which it finds exit through a circular opening to



The Orchard Gas Soldering Furnace

the point of ignition. The circular opening is formed by means of a tube leading through the mixing chamber, so that the inner circle of flame is supplied with pure air as well as the outer side of the flame when the burner is in use, thereby securing a better combustion and a greater heating capacity from the same consumption of gas. It is pointed out that the burners will not smoke or soot. The cover for preventing currents passing over the soldering irons can be removed and the furnace used for melting solder or other purposes. The company also manufacture a large variety of gas furnaces with burners of the same type adapted for various trades and mechanical uses. At the present time they are meeting with a good demand for their Orchard parlor heater, which is provided with a burner of the same type and a perforated planished iron body to be used for heating rooms.

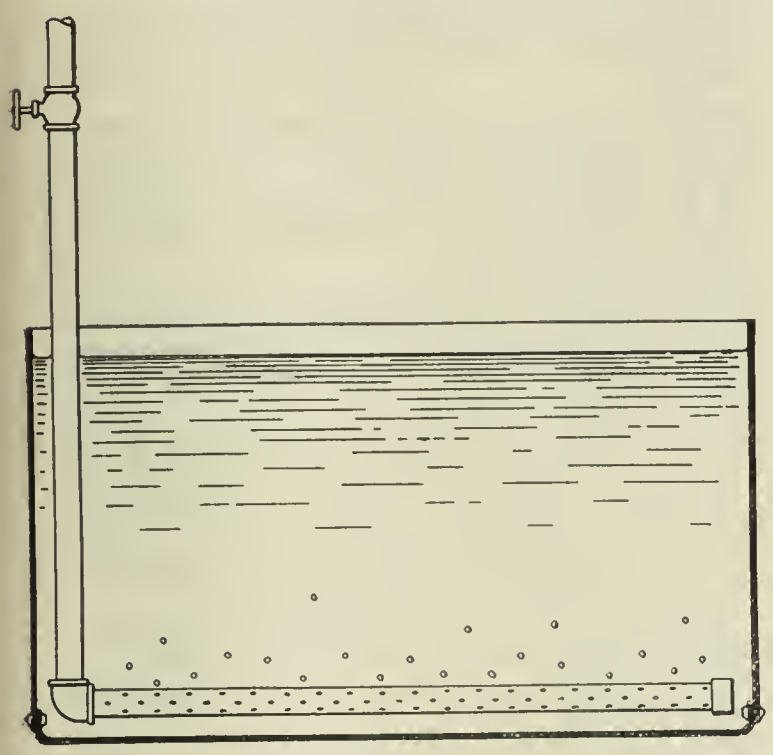
Ventilation of School Houses.

Prof. Alexander Chaplain of Easton recently read a carefully prepared and instructive paper before the annual meeting of the Association of School Commissioners of the State of Maryland at Baltimore on the following subject : " In the Construction of New Schoolhouses, with Limited Means, What Is the Best Plan for Ventilation ?" Professor Chaplain's views met with unanimous approval. In part he said :

If fresh air is introduced into a room a corresponding provision must be made for the escape of foul air, for only as much air can be brought in as the ventilating shaft discharges foul air. The ventilating flue, therefore, should be large enough to insure the free circulation of the pure heated air through the room in the full measure and capacity of the cold air box and the heating apparatus. Uniform and reliable ventilation can only be secured by expensive appliances and fan machinery, which cannot be thought of for our ordinary and simple school buildings. But when it is asserted by those who have given the subject most attention that one-half of the diseases which afflict the human race can be traced directly to the breathing of impure air, and that children are many times more sensitive to atmospheric poison than adults, it is a crime for those who have charge of planning and constructing our school houses to neglect to provide them with at least some simple and economic means of ventilation.

On Heating Water by Steam.

One of the most familiar problems in dye houses and many other industrial establishments, says *The Locomotive*, to whom we are indebted for the accompanying illustrations, is the heating of considerable masses of water from comparatively low temperatures up to the boiling point, and the simplest and commonest way of accomplishing this end is by passing live steam into the



Heating Water by Steam.—Fig. 1.—Heating by Direct Injection.

tank which contains the liquid that is to be heated. This operation, in fact, is met with so universally that one would naturally suppose that the principles it involves would be thoroughly understood by every mechanic, and yet we find that such is not the case. It is by no means rare to find such tanks piped up for steam in a way which proves that the piper had no very clear idea of how the thing is done.

In arranging a tank for heating water or other liquids by steam, we have two general methods between which to choose. We may discharge the steam directly into the liquid to be heated, by means of a perforated pipe, as shown in Fig. 1, or we may lay down a coil of pipe in the bottom of the tank, as indicated in Fig. 2, and obtain the desired heat by conduction through the metal of the pipe. The arrangement shown in Fig. 1 is far more frequently met with than that shown in Fig. 2, probably on account of its greater simplicity. Sometimes, however, it is not permissible or desirable to discharge the steam directly into the contents of the tank—as when working with indigo dyes, for example—and in these cases the method shown in Fig. 2 must be adopted.

In either case it is of the first importance to have the steam pipes lie along the very bottom of the tank, in order to insure good circulation and a uniform temperature throughout the contents of the tank. We often find such tanks put in with the coils (or the perforated discharge pipe) running around the sides of the tank, just below the surface of the liquid contents, but a single glance at such an arrangement ought to show that it is radically wrong. At all ordinary temperatures water expands upon being heated and becomes lighter. If the heating pipe is in the bottom of the tank, the water that is in contact with the pipe will grow hot and expand and will rise toward the surface. An undercurrent of colder water will flow down along the sides of the tank at the same time to take its place, and so the process will continue, the coldest water always sinking to the bottom and coming into contact with the hot pipes that contain the steam, until the entire contents of the tank is heated to the boiling point. Now if the heating pipes had been placed near the top of the tank instead of at the bottom, the water in contact with them would grow hot and expand just as before, but being already at the top of the tank it can rise no further and the result is that it stays where it is and grows hotter and hotter until it boils, while the main body of the liquid below remains quiescent and almost as cold as it was at first, because there has been nothing to bring it in contact with the steam pipes. That is why it is wrong to put the heating pipes at the top of the tank. Placed at the top they give no circulation; while if placed at the bottom they produce a good circulation and the whole tankful of liquid is then heated uniformly and regularly up to the desired temperature.

Now, having decided which of the two methods shown in Figs. 1 and 2 will be best for the purpose in hand, the next question is how much steam will be required to bring the contents of the tank up to the boiling point? Here, too, we find that mistakes are easily made. It takes a great deal of heat to raise a ton of water up to the boiling point, and pipers very often greatly underestimate the quantity of steam that will be required. A rough rule, which gives pretty good results in general practice, is to allow 1 pound of steam for every 5 pounds of the water that is to be heated up to 212 degrees. For most purposes this will be found to be quite sufficient, but as the more accurate process is quite simple, we shall give that also.

Heat Given Out by a Pound of Steam at Various Pressures, in Condensing into a Pound of Water at 212° F.

Gauge pressure.	Heat units.	Gauge pressure.	Heat units	Gauge pressure.	Heat units.
Pounds		Pounds		Pounds.	
0	965	15	976	50	991
2	967	20	979	60	994
4	969	25	982	70	997
6	970	30	984	80	999
8	972	35	986	90	1001
10	973	40	988	100	1003

A pound of steam at atmospheric pressure, in condensing into a pound of water at 212 degrees F., gives out about 965 units of heat—that is, the heat that it gives out would be sufficient to raise the temperature of 965 pounds of water by 1 degree. If the steam were originally at a greater pressure than that of the atmosphere, it would give out a little more than this amount of heat, but the difference is not nearly so great as might be expected.

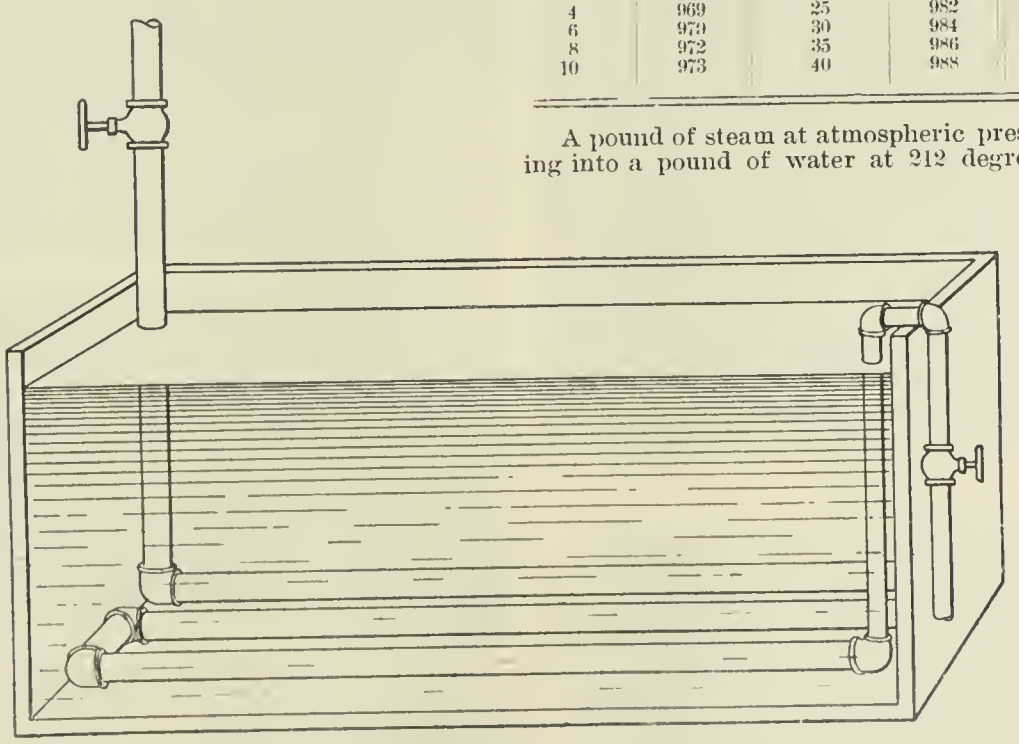


Fig. 2.—Heating by a Closed Coil.

Thus 1 pound of steam at 100 pounds gauge pressure gives out 1003 heat units upon condensing into water at 212 degrees, and this, it will be seen, is only about 4 per cent. greater than the heat given out by the same quantity of steam at simple atmospheric pressure. The number of heat units given out by a pound of steam, in condensing into water at 212 degrees is given for various gauge pressures in the accompanying table, which is based on data given by Clausius.

Now let us take a numerical example. Suppose our tank contains 7500 pounds of water at a temperature of 48 degrees F., and we want to know how much steam must be drawn off from a boiler carrying 70 pounds in order to heat this water up to the boiling point. Our rough rule of allowing 1 pound of steam for every 5 pounds of water would call for 7500 ÷ 5 = 1500 pounds of steam, or three-quarters of a ton; and while this result does not pretend to any great degree of accuracy, it is near enough to the truth to show how badly deceived a piper would be if he "guessed" that 100 pounds or so would be sufficient.

To calculate the amount of steam required with greater accuracy, we must first find out how many heat units we have got to supply to do the required work. The water in the tank is originally at 48 degrees F., and we wish to heat it up to 212 degrees. We must therefore raise its temperature 212 degrees — 48 degrees = 164 degrees. Now a "heat unit" is the amount of heat that is required to heat 1 pound of water 1 degree; and hence it would take 164 heat units to heat 1 pound of water from 48 degrees up to 212 degrees. But we have to heat no less than 7500 pounds through this range of temperature, and since every one of these pounds calls for 164 heat units, the total heat supplied must be 7500 × 164 = 1,230,000 heat units.

Having found out how much heat will be required, the next question is, How much steam at 70 pounds pressure shall we have to use to obtain this quantity of heat? By referring to the table we see that 1 pound of steam (at 70 pounds gauge pressure) will furnish 997 heat units and no more, and therefore to get the required 1,230,000 heat units we shall have to use 1,230,000 ÷ 997 = 1234 pounds of steam.

This process may be summed up in the following:

Rule—To find the weight of steam that will be required to heat a given body of water from a given temperature up to the boiling point, multiply the number of pounds of water in the tank by the number of degrees through which the water is to be warmed and divide the product by the constant that is given in the table, for the particular pressure of steam that is to be used. The result is the number of pounds of steam that will be required.

[If the contents of the tank is given in cubic feet or in gallons, instead of in pounds, multiply the number of cubic feet of water in the tank by 62.3 and the product will be the weight of the water in pounds, or multiply the number of gallons by 8⅓, and the product will be the weight of the water in pounds.]

The method of calculation here given is strictly accurate when the steam is blown directly into the liquid to be heated as in Fig. 1, but when the water of condensation is kept separate from the contents of the tank and is removed from the coils by means of a drip pipe as shown on the right in Fig. 2, the result obtained by the foregoing rule is merely a close approximation, unless the heating process is so regulated that the condensed water drawn off from the coils is always just at 212 degrees. If the condensed water so drawn off is below 212 degrees, as it may sometimes be when the water in the tank is still quite cold, the rule gives a result slightly too large. It is always very close to the truth, however, and its departure from strict accuracy in the case of Fig. 2 is due merely to the fact that in making out the table given above we have assumed that the condensed steam cools precisely to 212 degrees. If it should cool a trifle more or less than that, owning to its being drawn off from the coils before the water in the tank is fully heated to the boiling point, the results obtained by the rule will be in error by a correspondingly slight amount.

NOTES.

The plumbing and hardware firm of Dearborn & Greenwood, at Malden, Mass., have been dissolved, and the business will be continued by Mr. Greenwood.

W. H. Teemer & Co. have opened a plumbing establishment at 230 Fourth avenue, McKeesport, Pa.

James Donnelly has removed his plumbing establishment to the Farley Block on Main street, Boonville, N. Y.

The Lyman Water Circulating & Heating Company have been incorporated at Chicago, with a capital stock of $25,000, by James P. Whedon, C. S. Keown and Ralph E. Hatcher.

Reuben S. Bemis, City Inspector of Plumbing of Providence, R. I., recently gave a lecture on plumbing and drainage at a meeting of the Franklin Society of that city. In his lecture he stated that previous to 1894 the plumbing and drainage of buildings in that city had been done in accordance with the views of the owners regardless of correctness of design from a sanitary standpoint, and in many instances cases of typhoid fever or other diseases could be directly traced to the bad plumbing of buildings. He gave a detailed account and an explanation of the present law and its provisions for laying out plumbing work to avoid the troubles of the past. He also exhibited numerous drawings showing the defects commonly found in plumbing systems.

Robert Carlisle of the plumbing goods house of Thomas Gibson Company, Cincinnati, Ohio, gave a lecture on sanitary plumbing before the Cincinnati Chapter of Architects of that city.

Bids will be received at a special meeting of the Hoboken, N. J., City Council on December 15 for plumbing the new Armory Building.

K. L. Cowgill of Dover, Del., has been awarded the contract for plumbing the new building at the State College for Colored Students.

Since the law has gone into effect at Boston requiring that gas fitters shall pass an examination and take out a license a scarcity of gas fitters has been noticed owing to the failure of a number who have heretofore done gas fitting to stand the test.

The Board of Education of Mount Vernon, N. Y., awarded the contract for heating the new West Mount Vernon school building to W. E. Rois of Brooklyn for $3735. This is for the steam hot blast system, the equipment being that of the Buffalo Forge Company.

Chas. P. Stamm has opened a plumbing and steam fitting shop at 213 Market street, Portsmouth, Ohio.

Albert Lovely has opened a plumbing and tinning shop at West and Lovely streets, Southbridge, Mass.

Tyler & Bennett succeed Frank Tyler in the plumbing business at Albion, N. Y.

T. J. Clark of Floyd Township, Woodbury County, Iowa, has just completed the most extensive line of farm plumbing ever done in that section of the State. He has built a 50-barrel reservoir on an eminence a quarter of a mile from his house and feed yards, and pumps water into it from the valley below by wind motor power. From the reservoir water is conveyed to all parts of the premises, 2800 feet of pipe being used.

Besides furnishing the extensive sheet metal work for the remodeled Savoy Hotel, T. W. Corbett, New Haven, Conn., is reorganizing the plumbing system in the hotel. In the new Moses Building on Chapel street he has just installed a Bundy Steam Heating Boiler, which is now in use.

The journeymen plumbers of Washington, D. C., have appealed to the District Commissioners against the changes proposed in the plumbing regulations which would deprive them of representation on the examining board. They indorse the regulations requiring the examination of plumbers and the inspection of plumbing.

A consular report says that the development of Johannesburg, Kimberly, Natal and the mining and farming districts of British South Africa generally is calling for building materials in ever increasing quantities. Plumbers' supplies are said to be in especially active demand. As nothing of the kind is made in the country, the prospects for a good market for foreign manufacturers are favorable.

The Fowler & Wolfe Mfg. Company, Philadelphia, are sending out Fowler Radiators in such quantities as to tax their producing capacity to the utmost.

A large card is received from the Judson A. Goodrich Company, 120 Beekman street, New York City, bearing a transparent view showing the construction of the Water Seal Automatic Air Valve. The object of the card is to announce that the company have purchased the entire output of the New York Valve Company, and hereafter will be able to furnish on short notice Back Pressure Valves, Reducing Valves, Radiator Valves, Air Valves, Pump Governors, Damper Regulators, Steam Traps and Water Feeders.

Edward Gurney of Toronto, Canada, was one of the visitors of I. G. James, 48 Centre street, manager of the New York office of the Gurney Heater Mfg. Company, Boston, Mass, this week.

Deckert & Braconier are a new firm in the plumbing business at 22 South Seventh street, Fort Dodge, Iowa.

Nicols & Ryan of Appleton, Wis., have opened a branch of their plumbing establishment at Neenah.

The plumbing shop of P. J. Reaney, 1177 Fort street, Detroit, Mich., was recently visited by a slight fire.

The American Sanitary Ventilating Company have been incorporated at Butte, Mont., by Ed. D. Neill, Arthur

O'Brien, T. H. Kleinschmidt, C. B. Miller and August Fack of Helena and James H. Monteah of Butte, with a capital stock of $125 000. The company will manufacture, buy and sell sanitary devices and appliances.

W. H. Blanchard has been taken into partnership by W. H Hitchcock of Palmer, Mass., in his heating and plumbing business.

John H. Izett, Jessie F. Izett and Henry W. McGee have filed articles of incorporation with the Colorado Secretary of State for the Izett-McGee Plumbing Company, the capital stock of which is $5000. The company will carry on business in Denver.

A neat folder is received from the Judson A. Goodrich Company, 120 Beekman street, New York City, entitled "How We Came by the Wish Bones," referring to their Thanksgiving circular requesting good wishes for them and their line of high grade steam specialties. The explanation is in a pleasant strain, and leads one to suppose that the company had subsisted on a turkey diet for a considerable time in order to accumulate so many wish bones. For the gratification of our curiosity it was explained, however, that the wish bones were imported by the house who printed the circular. It further appears that in Europe there is a custom among the cooks in families and hotels, restaurants and other places to save wish bones and to sell them, there being a market for these articles where collectors can dispose of them.

W. M. Mackay, president of the American Society of Heating Engineers, attended the annual meeting of the American Society of Mechanical Engineers in New York this week as a guest of the society.

Francis Brothers & Jellett have transferred their New York office to 70 Trinity place, where S. A. Jellett has larger quarters and better facilities for attending to their growing heating and contracting business in this vicinity.

The workmen at the sanitary ware potteries at Trenton, N. J., are looking forward to the restoration at Christmas of the 12½ per cent. which was cut from their wages some time ago. The potteries are all running busily, and the manufacturers report steadily increasing demand for goods. The Western operative potters have decided to give up the idea of forming a uniform wage list, and will accept the 12 per cent. advance upon present wages offered by the Manufacturers' Union.

James McGuckin of the firm of J. McGuckin & Brother, plumbers, at 1023 Christian street, Philadelphia, Pa., died at his residence in that city Saturday, November 20, after a protracted illness. Mr. McGuckin was 60 years old at the time of his death and had been in business for 30 years in Philadelphia, and formerly was prominent in operation work in that city. Mr. McGuckin was never married.

A dispatch of December 2 from Cleveland, Ohio, states that the sewer pipe manufacturers, who were in session there for two or three days this week, with the object of forming a combination, adjourned without reaching an agreement. It was said that some of the big manufacturers who had been counted upon to support the movement had declined to do so.

Couch Exhaust Radiator Company, Chicago, have been incorporated, with a capital of $100,000, to manufacture Radiators and Railway Appliances, by Thomas B. McGregor, Frank G. Howser and Belle W. Barry.

John Mills has resigned his position with the Crane Company, New York, and will engage in the Heating and Supply business at Providence, R. I.

Edward T. Davis, one of the Republican nominees for Councilman from Ward Three, Springfield, Mass., is well known as treasurer and manager of the New England Plumbing Supply Company of Bridge street. He has been in Springfield nine years, coming from Providence, R. I. Mr. Davis is an Odd Fellow and a member of Hampden Lodge of Masons, Springfield Commandery, Knights Templar, and is a Shriner. He is also a veteran fireman director and one of the Membership Committee of the Y. M. C. A. This is Mr. Davis' first venture in politics. He owns considerable property in the ward, having recently put up two new buildings on Bridge street.

The Vance Boiler Works Company, Geneva, N. Y., have procured a handsome glass paper weight fitted with an adjustable and perpetual calendar, embellished with a cut of their unrivaled Heater, a brief description of its advantages and the names of the officers of the company. For the business man's writing desk it is a neat and useful souvenir.

The Humphryes Mfg. Company, Mansfield, Ohio, issue Catalogue H, bound in stiff cloth covers and containing 349 pages. The company are manufacturers of Iron and Brass Pumps for hand and power use. Brass Goods and Supplies for steam and gas fitters, Supplies for engine builders and water works, to which lines of goods the catalogue is devoted. Near the front of the book is a view of the buildings embraced in their extensive plant. The catalogue contains an index, cipher system, information concerning Pumps, figures and formulas, discount equivalents, &c. The book has been carefully compiled and is well printed on a fine quality of paper and contains illustrations and list prices

The Acetogen Acetylene Gas Generator.

The Acetogen is an apparatus for the generation of acetylene gas. It is intended for use in making illuminating gas on a small scale, as, for instance, for a single dwelling house or store. Much has been printed about acetylene gas, and our readers are doubtless aware that it is produced by treating calcic carbide with water in specially designed apparatus, the carbide being made by mixing finely ground coke and lime and fusing the mixture at a very high temperature in an electric furnace. It is but recently that calcic carbide has been produced on a sufficiently comprehensive scale to enable it to be readily purchased for gas making. The gas produced has a much higher illuminating power than ordinary city gas, 5 cubic feet of it being equal in illuminating value to 60 to 75 feet of the ordinary gas. Burners are therefore used with very much smaller tips. A dwelling is piped in the ordinary manner, and a gas generator is placed in the basement connected with the pipes.

The Acetogen is an automatic generating apparatus, which consists of a generating chamber, entirely surrounded by water contained in an outer chamber, above these being a gas holder, inside of which is a purifying chamber. Access to the generating chamber is by means of a removable, self sealing iron door. It contains a drawer provided with suitably arranged gratings for the carbide. Water is admitted through a valved opening from the outer chamber, and attacks the carbide from below. As the carbide is disintegrated the residuum falls into a drawer and is withdrawn therewith. Generation is controlled without the introduction of any mechanical device, by maintaining a water level in the outer or supply chamber higher than the grating in the generating chamber. The water, in seeking its level through the opening between the chambers, constantly tends to flood the carbide on the grating and is held back by the pressure of the gas, which is instantly generated by the water contact. When gas pressure exceeds that of the water, the latter is driven back into the outer chamber until it is below the carbide, when gas generation practically ceases. When pressure has been reduced by consumption of gas the water again attacks the carbide, and the operation is automatically repeated until the carbide is exhausted. Purification is accomplished by passing the gas through a large cooling chamber, inside the gas holder, causing it to circulate in contact with the water cooled walls, and finally to the outlet pipe, pure, dry and in condition for burning. Condensation is automatically cared for, there being no pet cocks to be opened and perhaps neglected.

In the construction of this generator the very great importance of maintaining in it a low temperature has been carefully observed. The overheating of the gas is due to causes which have been avoided in the Acetogen. Its safety is demonstrated by the fact that the Patent Device Committee of the Chicago Underwriters' Association signed a report containing the following statement: "We are satisfied that it is safe in the hands of ordinary inexperienced persons." The construction permits of the utmost simplicity, there being no mechanism to be deranged by use or corrosion, and the parts requiring manipulation have been reduced to a minimum. It can be set up by any careful mechanic who will follow the directions given. The Acetogen is the invention of Augustine Davis, and is manufactured by F. Cortez Wilson & Co., 239 and 241 Lake street, Chicago.

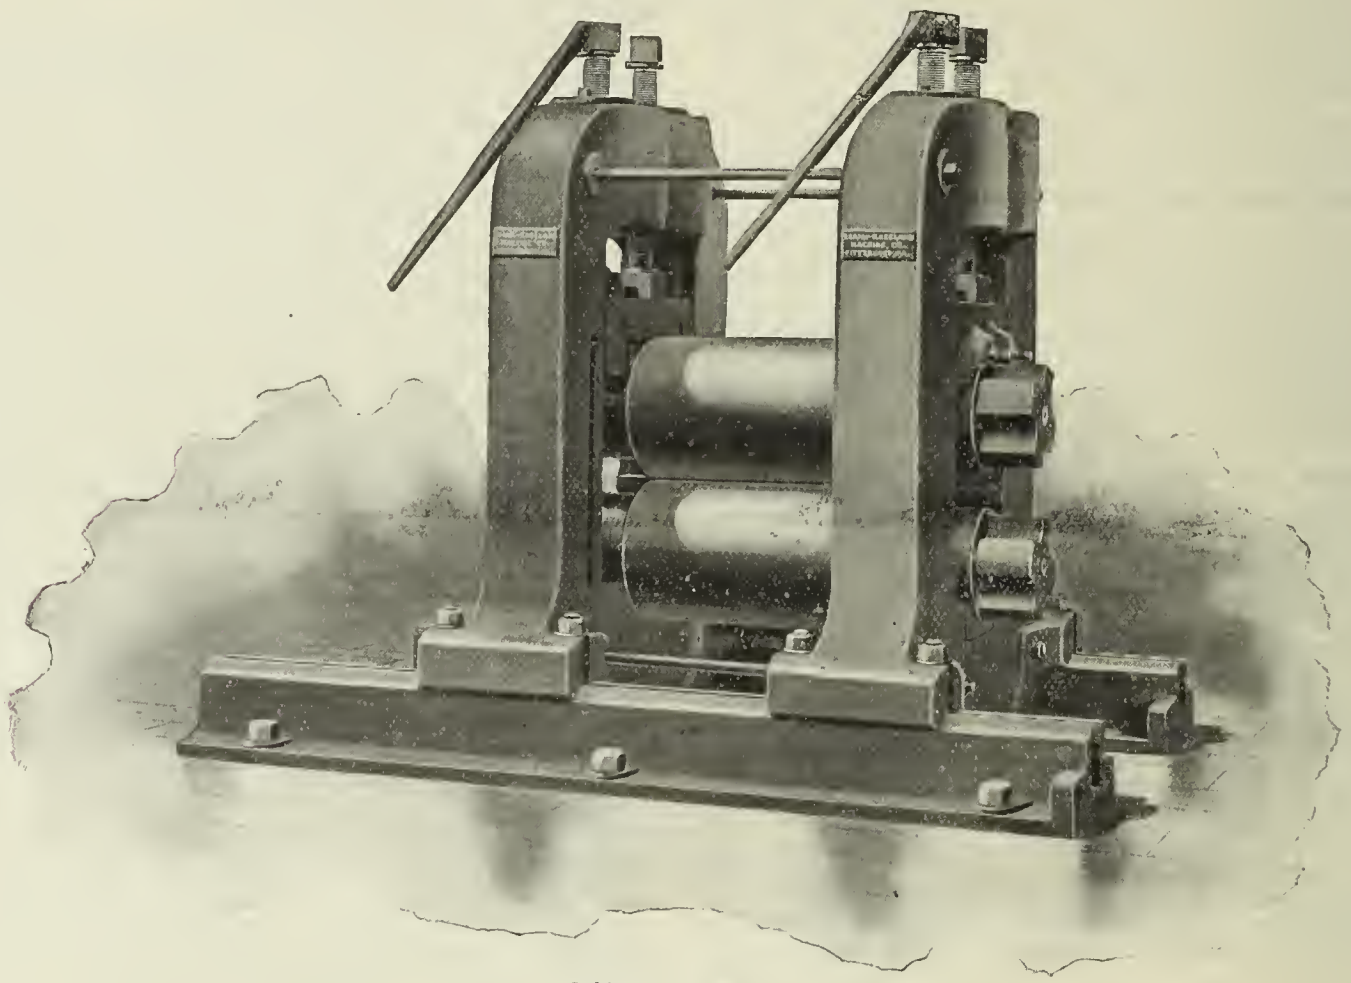
The Murphy contract for handling the garbage of Chicago was not consummated, and the elaborate scheme for burning it will not therefore be carried out On Monday of this week the matter was settled by the division of the city into four districts, in two of which contracts were awarded to Mulcaire & Burke, who will use the Merz reduction system, now operated in Milwaukee and St. Louis. Dowdle & Chamberlain get one of the districts and will use the Chamberlain reduction system, as operated in Detroit and some Eastern cities Hanrahan & Downey get the remaining district, and will use the Flinn reduction system, which is operated in Pittsburgh. The reduction plant in each district is to be built by March 1. The contracts awarded are for five years.

Snow storms and frost ushered in the winter this week. The advent of cold weather has stimulated the demand for seasonable goods in all parts of the country.

TIN PLATES.

Cold Rolling Mills.

We illustrate the latest idea in cold rolling mills, as manufactured by the Frank-Kneeland Machine Company, Pittsburgh, Pa., makers of rolling mill machinery. The rapid growth of the tin plate industry has called forth this class of machinery and the development of ideas has kept close pace with the demand. Cold rolling in the tin mill is one of the most important steps in the production of plates. A smooth surface free from "buckles" is most important. To secure this the rolls must carry a fine face, and be capable of accurate adjustment, and be held firmly in place. These requirements are secured by the quality of the rolls, massiveness of the housings, and the four top screws; by means of the latter, the rolls can be held perfectly parallel and are capable of the finest adjustment. These mills are largely used for cold rolling all classes of planished plates for stove pipe, stamping and taggers iron, also in brass and copper rolling mills. The above firm build special mills for cold rolling strip.



Cold Rolling Mills.

SCRAP.

The American Tin Plate Company, Elwood, Ind., have begun the erection of a two-story assorting building, 100 x 200 feet, which was made necessary by the increased output. The company have started up their new bar mill, and advise us that it is working very satisfactorily. They use a billet 6 inches square and 6 feet long and are doing good work. This mill is said to be one of the best arranged bar mills ever built, having a capacity for turning out a very large tonnage. It was built by the Robinson-Rea Mfg. Company of Pittsburgh.

The National Tin Plate Company of Monessen, Pa., have taken out a charter of incorporation, with a nominal capital stock of $1,000,000. This concern have had under erection at Monessen for some time a Tin Plate plant, which will be ready for operation some time early next year. Their capital stock will eventually be increased to $1,000,000. They operate a branch works at Anderson, Ind.

It is reported that the new Tin Plate works of the Laughlin Nail Company, at Martin's Ferry, Ohio, is to be an eight-mill plant instead of a six-mill, as originally intended. This will give the concern a total capacity of 14 mills.

The works of the American Tin Plate Machine & Mfg. Company, Canal Dover, Ohio, are reported to be running full day and night.

Ground has been broken at New Castle, Pa., for the erection of the new Tin Plate plant of the Shenango Valley Steel Company. The main building for this plant will be 1650 feet long by 100 feet wide, while there will be a second building 750 feet long by 60 feet wide. It will be remembered that the contract for these buildings was placed some time since with the Shiffler Bridge Company, while the rolling mill equipment will be furnished by Mackintosh, Hemphill & Co., also of Pittsburgh, and the engines by the Edward P. Allis Company of Milwaukee, through J. Weldman Murray, their Pittsburgh manager.

John Hamilton, Pittsburgh, Pa., manufacturer of Hamilton's Best Re-Dipped American Roofing Tin, is meeting with a very heavy demand for this brand of Plate. Up to December 1 the sales of this Plate have been nearly 50 per cent. larger than during the entire year of 1896. This certainly speaks well for these goods, and is the best evidence that they are giving satisfaction wherever used. Mr. Hamilton has under erection a Black Plate mill at West Newton, Pa., which will be ready for operation about January 1. It is a two-mill plant, having two hot mills and three cold mills, and will enable this firm to guarantee to their customers a superior quality of Black Plate right along.

At the annual banquet of the Llanelly Chamber of Commerce, held recently, Sir John Jones Jenkins, M.P., illustrated the change which has come over the Welsh Tin Plate trade in recent years by reference to the fact that in the previous week 58,000 boxes of Tin Plate were shipped from Swansea, and not a single box of this large quantity went to the United States. Ten years ago, said Sir John, this would have been looked upon as incredi-

ble. It showed, however, that new markets are opening out for Welsh Tin Plates.

Follansbee Bros. Company, Pittsburgh, Pa., advise us that they have increased the weights of their guaranteed high grade Roofing Plates, making them more valuable to the consumer. Thus Scott's Extra Coated now carries 47 instead of 46 pounds of coating per box, Triumph Old Method has 38 instead of 36 pounds, and Protection Old Process 40 instead of 36 pounds as heretofore.

The Lalance & Grosjean Mfg. Company's mills at Harrisburg, Pa., are running full in all departments. Three Tin mills and two Sheet mills are kept busy turning out material to supply the requirements of the company's factory at Woodhaven, Long Island. The November output of the Harrisburg plant was by far the largest in its history.

Aurora Shears and Punching Machines.

The hand machines illustrated herewith are new machines which have been designed for the use of manufacturers of specialties, carriage makers, blacksmiths and others whose work does not call for such constant use as would justify the application of power in some form. They are the result of many years of experience in the manufacture of hand shearing and punching machines by D. H. Smalley & Co. of Aurora, Ill.

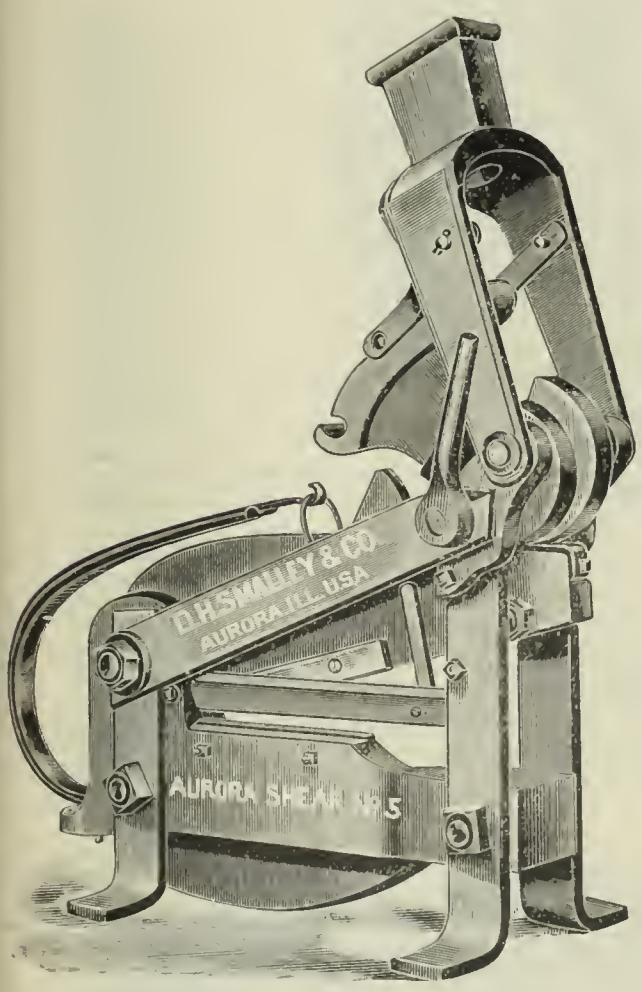


Fig. 1.—Aurora Shear.

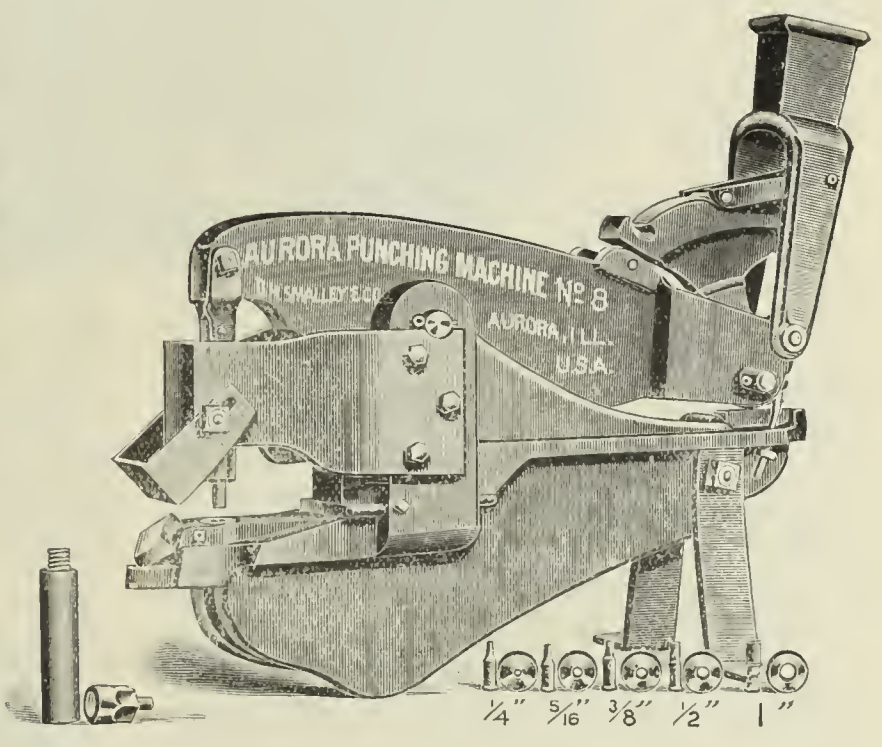

Fig. 2.—Aurora Punching Machine.

The Aurora shear, shown in Fig. 1, is a very compact tool, built for heavy service and supplied with a powerful leverage. Friction is reduced to the minimum. It will be seen by reference to the cut that all adjustments are quickly and easily made. The work is in plain sight. The piece to be sheared is held level on the knife by a bar holder, which is always in place ready for use. This shear cuts cold iron 1 inch square or 1⅛ inches round and flats in proportion up to 8 inches in width, at one movement of the cam.

The Aurora punching machine, Fig. 2, is adapted to general work, and punches angle iron up to 3 inches by 3 inches by ½ inch. It will punch a ½-inch hole in ½-inch iron to the center of 12 inches. No adjustment of dies is necessary, as the dies and punches are self centering. Hence no time is lost in fitting up for desired changes. The plunger moves perpendicularly in a long perfect guide, making it possible to punch metal of greater thickness than the diameter of the punch without injury to the latter. A smaller machine of the same general construction is made which takes angle iron up to 2½ inches by 2½ inches by ⅜ inch and punches ½ inch holes in ⅜-inch iron to the center of 5½ inches.

All arbors and main bolts in both shears and punching machines are of steel and case hardened. The system of compound levers which is used makes operations comparatively easy on the heaviest work.

Air Ship for the Klondike.—Hiram S. Maxim, who holds the office of superintendent of construction of the Atlantic & Pacific Aerial Navigation Company, announces that the company have in course of construction an air ship which is expected to make a trip to the Klondike region next spring. Mr. Maxim describes the apparatus as follows: "When everything necessary is on board the ship will weigh 5000 pounds, and we shall take on board about 1 ton weight of passengers and provisions. The space occupied will be 106,000 cubic feet. The propelling power will be a 16 horse-power naphtha engine, which will be made out of aluminum as far as that metal can be used, and will weigh complete 900 pounds. The gasoline will be stored in tanks in the cases, which will contain a sufficient quantity to drive the vessel around the earth without replenishing the tanks. The skin of the ship will be double and the intermediate space will be filled with hydrogen gas. This gas will be confined in separate compartments and will be in the upper part of the cylinder and in the cones."

An advance of 10 per cent. has just been ordered by several of the leading manufacturers of rubber goods in the prices of most of their products. The advance is understood to be the result of concerted action by an association recently formed, to be known as the Mechanical Rubber Manufacturers' Association. It is attributed priamrily to the higher prices of raw material, it being estimated that nearly all grades of rubber used by the mechanical rubber manufacturers have advanced 33⅓ per cent. in value in the past 12 months. The principal explanation for this advance is the enormously increased demand for rubber for bicycle tires. The articles mainly affected by the present advance are belting, packing, hose and other similar goods.

It is calculated that nearly $14,000 worth of electricity is expended nightly in New York City for illuminating purposes. By a late calculation there are 1,030,468 electric lights, both arc and incandescent, in use in the city, with an estimated total candle power of 50,000,000.

Returns published by the Ohio Secretary of State show that 1135 new enterprises were incorporated in that State during the past year. The total capital invested in these enterprises was $73,381,020, the largest proportion being in building and loan associations, after which come manufacturing concerns and railway companies.

A movement is on foot to establish a permanent exhibit of California products in New York City.

Statistics which have just been issued of the production of the Prussian mines during 1896 give an output which is 71,058,119 tons greater than that of the previous year, while the value was $17,502,000 higher. The increase was most pronounced in pig iron, but spelter, lead, copper and silver also showed substantial gains.

STOVE TRADE NOTES.

Dustless Buildings.*

BY C. J. WOODBURY, BOSTON, MASS.

The increased hight of office buildings, rendered possible by what Otis Tufts patented as the vertical railway, while bringing to their occupants relief from the noise of the streets and affording comfort by extending above the fly belt, which is as well defined as the snow line on a high mountain, also exposes the occupants to the fine dust which pervades the whole structure and which the other salutary conditions of the building render more prominent. The modern method of heating and ventilating such a building is by means of a blast of air drawn down a flue, warmed and forced through the building in such quantities that four times the volume of the building is frequently circulated through the rooms each hour.

This method of heating, although a more efficient application of radiating surface for heating the air than by direct radiation in rooms, can be managed with far less expense for attendance, repairs and fuel, and provides the sanitary requisite of ventilation without cold drafts, yet this apparatus distributes large amounts of dust through such a building, and in a city using bituminous coal under the average conditions there is a fine carbon dust which is especially obnoxious, impairing drawings, books, delicate mechanism and whatever may be injured by the shower of fine, impalpable dust, which produces black indelible smooches whenever touched. This carbon dust is always an annoyance and at times a serious matter.

The writer undertook to abate the difficulty of dust in a building of nearly 500,000 cubic feet capacity, through which 26,000 cubic feet per minute was usually blown, for heating and ventilation. The outside air used for this purpose was drawn down a flue 37 square feet in cross section and reached a velocity of 700 feet per minute. The means taken to remove the foreign substances from the air was by use of cotton cloth filters so arranged that the air should approach the fabric at an acute angle by which the momentum would carry these particles beyond a point where the element of air under consideration would pass through the filter and the particles of dust would be carried by the place and, striking the cloth at a lesser angle, tend to glance off and be carried to the bottom of the filter, rather than to clog the interstices in the fabric. The area of the filters being larger than that of the flue, the rate of filtration was inversely slower than the velocity of the air down the flue.

The means by which this was accomplished were very simple. A timber frame, divided by partitions into fine rectangular openings, was placed at the top of the flue, and under each opening was placed a bag whose top was attached to a light wood frame slightly larger than the opening, making a tight fit, so that the air entering the flue must pass downward into these bags, which were over 30 feet in hight. An arrangement of guides, ropes and pulleys enabled the bags to be raised and lowered by a person at the bottom of the flue. The bottoms of the bags were made open, and closed with a drawing string, and hoops kept the lower portion distended. An arrangement of lines extending along the sides from end to end facilitiated turning inside out and back again when they were being cleaned. The whole of the mechanical arrangement is fully described in United States patent No. 589,772. These bags were square at the top, where their combined area equaled that of the flue, but soon diminished to a cylindrical section, occupying about 40 per cent. of the space, thus affording ample clearance for the exit of the air passing through the fabric.

The area of the flue was 3¾ per cent. of that of the bags, and while the air passed down the flue at a velocity of 700 feet per minute, it passed through the fabric at 26 feet per minute. From ½ peck to 1 peck per month of fine dust was gathered from the bags. The efficiency of the device was tested by placing freshly painted boards at the bottom of the flue before the installation of the apparatus, and then giving another coat of paint after the apparatus was in service. In the first instance the fresh paint collected fine dust until it resembled fine sandpaper and in the second the paint dried with a smooth surface. In several of the offices split laps of absorbent cotton were placed in various parts of the building before and after the bags were in service, and one set was covered with fine particles and the other was free. The change was not a notable one at first, owing to the large amount of dust in the flues, but much of this was removed by running the blower at a very high rate of speed and afterward removing the registers and washing them and the flues as far as could be reached. The device has been solely under the care and management of the men employed on the engine and boilers, and has served its purpose in rendering a building free from dust caused by the ventilating system.

* Presented at the New York meeting of the American Society of Mechanical Engineers, Nov. 30–Dec. 3, 1897.

Cornelius C. Lent.

The stove trade of the country has lost another veteran member in the death of Cornelius C. Lent, president of the Peekskill Stove Works, which occurred at his home in Peekskill, N. Y., on Friday, November 26, after an illness of several months. Mr. Lent was one of Peekskill's foremost and most respected citizens, and his life's history is part and parcel of that place. He lived in Peekskill for more than half a century and was identified with its business interests, its social functions, its religious centers and its fraternal orders. He was born May 9, 1826, at Continentalville, a few miles north of Peekskill, being the son of Godfrey Lent, a farmer. He was educated at the district school, and when 18 years of age he went to Peekskill, apprenticing himself to learn the trade of molder to Taylor & Flagler, who at that time were leading stove manufacturers. He proved an apt pupil, and not only learned the art of molding, but mastered the stove business in general, becoming a skillful mechanic. Some time later he took a position as pattern maker with the National Stove Works. In August, 1865, he embarked in business with the late Isaac T. Montross, Alonzo B. Pollock and Peter Staats, the firm name being Montross, Lent & Pollock. With a capital of $12,000 and 22 employees they began business life in a building on South Water street, then known as the Peach Orchard Foundry, and later occupied by the I. J. Baxter Iron Foundry and now owned by Uriah Hill, Jr. In 1871 the firm purchased from Mr. Hill, then president of the Union Stove Works, the lower dock property, said to be the most valuable water front to-day in Peekskill, giving partially in exchange their Water street property. In 1878 Mr. Pollock died and the firm became Montross & Lent. On July 5, 1887, Isaac T. Montross retired and the business was reorganized under the name of the Peekskill Stove Works, with Mr. Lent as president. Mr. Lent's life work was not confined wholly to the stove trade, as he was prominently identified with other local interests. In 1880 he was elected President of the village, but he declined a renomination, and this was the only occasion on which he occupied office. He was a trustee of the Peekskill Savings Bank, a member of the Peekskill Board of Trade and a prominent Odd Fellow, being for more than 30 years a trustee of the Grand Lodge of the State of New York. The funeral services were held at 2 o'clock on the afternoon of Tuesday, November 30.

A New Gasoline Stove.

George M. Clark & Co., 72 to 76 Lake street, Chicago, are bringing out a new gasoline stove for the season of '98 which they are confident will surprise the trade. They are keeping the details of its construction secret for the present, except so much as they tell in their double page advertisement in this issue. The stove can be put in full operation in 15 seconds from the time of striking a match, and they guarantee that it is absolutely free from all danger. The manufacturers have devoted more than three years to experimenting with this stove, working out a definite purpose, which they have finally accomplished. When George M. Clark & Co. grow enthusiastic over something the trade may rely upon it that a great deal is to be expected. The reputation of the house is so well established that their announcement cannot fail to be received with respect. Our readers will be given a full description of the new stove in due time. Geo. M. Clark & Co. are greatly enjoying the fine manufacturing facilities secured when they removed their works to Harvey, Ill. They find great convenience and economy in having all their work done on the ground floor. The advantages in receiving materials and shipping stoves by rail immediately at the factory have proved to be what they had an-

ticipated." Taking the whole enterprise, however, the benefits of the removal from the heart of Chicago which have already been realized are far greater than expected.

The Glenwood Patent Indicator.

The popularity of oven thermometers makes it of interest to study the construction of these devices. Through the courtesy of the Weir Stove Company of Taunton, Mass., we are enabled to present an illustration of the Glenwood patent indicator which they use and show some of its constructive features. Fig. 1 is a front view of the dial and Fig. 2 is from a photograph of the inside of an oven door, and brings out prominently the mechanism of the indicator. The indicator, it will be seen, consists of an irregular and broken ring of cast iron, fastened at one end by a screw to a cast plate which holds it rigidly in place. The ring is offset in a way to give bearings for the interior brass rods, shown plainly in Fig. 2. These rods are carefully made and adjusted by means of set screws, the ends of which are visible. The free end of the cast ring is connected by a thin strip of steel to a sort of compound lever, which actuates the hand that shows on the front of the indicator. The top of the hand, as shown in Fig. 1, is at the extreme left of the dial. As the temperature in the oven rises the brass rods increase in length and the free end of the cast ring is drawn out. The movement thus obtained is multiplied and the point of the hand swings to the right of the dial, according to the heat of the oven. The feature of this arrangement is its extreme simplicty, and we understand from the Weir Stove Company that the thermometers are giving most excellent results and are greatly appreciated by the trade. The cast iron ring merely serves to hold the brass rods and convey the motion to the steel strips and the indicator hand.

The Glenwood Patent Indicator.—Fig. 1.—Indicator Face.

Fig. 2.—Back of Indicator, Showing Mechanism.

ODD PLATES.

A meeting of the Western Furnace Manufacturers' Association has been called for Tuesday, December 21, in Parlor L 38, at the Great Northern Hotel, Chicago, to take action on the resolutions passed by the Eastern Furnace Association at their September meeting.

The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, are making arrangements to install a die making and repairing plant, and after January 1, 1898, expect to make and repair all of their own dies. In making furnace fittings the company operate over 500 dies and punches, and this number will be largely augmented during the coming year, as their line of Furnace Piping and Fittings is to be materially increased.

It is reported in the trade that some prominent Stove manufacturers are making arrangements to add to their line the manufacture of Hot Water Heaters and Steam Boilers for house heating. They are arranging to be ready for the spring trade.

The Richmond Stove Company of Norwich, Conn., have just purchased from the Norwich Saving Society the building adjoining their works on the south, covering 119 x 95 feet. In addition to this they have secured 224 feet of ground with the buildings thereon, located on Lower Thames street, also what is known as the Burt Building, which connects the two properties. These additions, we understand, will give the company a frontage on the river of 1000 feet. The improvements noted have become necessary in order to provide room for the company's increasing business, and it is stated that the foundry is melting daily more iron than at any time during the past two years.

A. W. Glessner, president of the Excelsior Steel Furnace Company, Chicago, departed December 1 on his annual winter vacation, and this season will penetrate the fastnesses of the Rocky Mountains about 500 miles beyond Denver, and incidentally will visit Salt Lake City, Ogden and other Utah points before returning East for the holidays.

The Michigan Stove Company received in their mail a few days ago a letter from one of their customers, a firm in Minnesota, who have been pushing the Front-Flue Oak Garland. The substance of the letter is that the results have been highly satisfactory, not only to the Minnesota concern but also to those to whom they have sold the stoves. After referring to the gratifying results the firm state that "the Front-Flue Oak Garland is the only

Stove we have ever had which is a full base Heater and can be used for any kind of fuel. The Stove is an unqualified success."

Henry H. Guernsey, New Haven, Conn., has been making a specialty of the Royal Hot Air Furnaces made by the Hart & Crouse Company, Utica, N. Y., and is enjoying a good trade. He has recently completed a number of heating contracts and is now engaged in the installation of 11 more Royal Furnaces for other parties.

Since the quarantines have been raised in various localities of the South the Standard Stove Works of Birmingham, Ala., have been rushed with orders. The demand comes from all points and shipments are being made as rapidly as possible.

The Girard Stove & Foundry Company of Youngstown, Ohio, report a good demand for their products and state that business is growing rapidly. Their trade is covering a more extensive territory than heretofore and the outlook is considered gratifying.

Some time ago Isaac A. Sheppard & Co., Philadelphia and Baltimore, got out a little book about house warming, which they called "Hints About Heating." It contained something more than hints, and was a clear headed elucidation of the theory of hot air heating for all buildings. It contained some tables of dimensions and proportions, which architects and builders found very helpful. Of course the book did not cease until it had also brought forward the fact that the Paragon Furnaces made by this company completely filled the bill of specifications which the book laid down. This book, we understand, has been adopted as a text-book in the architectural school of the State University of Illinois, at Champaign. The company have in press a third edition of the book, thoroughly revised and greatly enlarged. The new "Hints About Heating" will be in two parts, which may be had bound either separately or together. A great deal of interesting information is found in both parts about heating and about Paragon Furnaces. The new edition will have a handsome cover, especially designed for it.

Terstegge, Gohmann & Co., with main office at Louisville, Ky., and works at New Albany, Ind., are favoring their friends in the trade with an eight-page folder, the covers of which are embellished with a design humorous in character. A man of grotesque figure is seated in a chair busily engaged in reading. His legs are stretched at unusual length, and upon his feet are boots of mammoth size. The sole of each boot carries the words "Three sizes," while perched upon each toe is a chicken minus all but the tail feathers and with wide stretched mouth. One inscription on the cover says that the outside has nothing to do with the inside, and the reference to what the man is reading says, "He thinks it is interesting. For particulars see inside." On opening the covers of the folder we find illustrated descriptions of the Mystic Anchor Parlor Stove, adapted for burning hard or soft coal or coke, and offered in three sizes; the Torrid Anchor Fancy Cannon Air Tight, intended for burning the same kinds of fuel, and the Retort Anchor Air Tight Cannon, for coal or coke, also made in three sizes. These, the manufacturers state, in connection with their Regal, Acme and Giant Anchors, illustrated in supplementary catalogue No. 28, "present an unparalleled line of air tight heaters."

Mr. Edison's invention for crushing low grade iron ores and extracting the metal by means of magnets has lately been attracting a great deal of attention in all parts of the country, and one of the latest articles on the subject is that which appears in the Troy *Times* of November 23, the author being M. L. Filley, the well-known Stove man of that city.

It is stated that Messrs. Lowman having sold their interests in the Sheffield Stove Works, Sheffield, Ala., intend to start another Stove manufactory in that place as soon as suitable buildings can be secured.

Frank A. Goetz, for the past 12 years in the service of the Bridge & Beach Mfg. Company of St. Louis, Mo., died November 20 in the thirtieth year of his age. The company in announcing his death state that three years ago his health began to fail and he was called in from Southern Missouri, which territory he was covering, and placed in charge of the city trade, where the work was less difficult. On November 18 he was about the city visiting his customers as usual, but on the 19th he was seized with an attack from which he never rallied, and died just after midnight of the 20th. Mr. Goetz entered the service of the company when he was 17 years of age, and from the start showed an unusual aptitude for business. This trait, coupled with an earnest desire to do his full duty faithfully and conscientiously, caused him to fill every position to the entire satisfaction of his employers. His capabilities soon advanced him to the position of traveling salesman, and his uniform courtesy and his straightforward dealings gained for him the esteem and high regard of the trade in his territory of Southern Missouri, his associates in business and all who knew him.

Frank M. Gies, a director in the Co-operative Stove Company, at Black Rock, Buffalo, N. Y., died on the afternoon of November 22 after an illness of less than two days. He leaves a widow and seven children.

The Delta Double Heater is a stove which is finding a good demand at 239 Water street, where Manager John P. Ley of the New York office of Charles Noble & Co., Philadelphia, is bringing it to the attention of the trade. The Stove is of the round base burner type, arranged to take an air current from the floor and heat it and pass it from the heater by means of a pipe to a register in the ceiling into a room above, this type of Stove being very popular in old buildings in some localities.

The Mason & Davis Company of Chicago, Ill., have opened a salesroom in the Townsend Building, room 1001, at 1123 Broadway, New York, under the management of A. J. Eickmeyer, who is well known to the Stove and heating trade from his long connection with it. The company will make a specialty of their Combination Coal and Gas Range, and those interested in such goods will find an attractive exhibition at the headquarters.

The Charter Oak Stove & Range Company, St. Louis, Mo., advise us that they are now making the Grand Charter Oak in both Stove and Range form, with and without reservoir, for all kinds of fuel and in various sizes. This Stove heretofore was made in the Stove form only, but the trade called for it in Range form, hence the addition.

The heating department of the Ringen Stove Company, St. Louis, Mo., have just placed in position in the Coliseum, St. Louis, an extensive heating plant, which was tested on the 29th ult. The Coliseum is arranged to seat between 11,000 and 12,000, so that some idea of the immensity of the building is thus obtained. The building contains over 5,000,000 cubic feet of air space. At the test above referred to the building was heated from 20 to 65 degrees in four and one-half hours, or exactly 10 degrees per hour. The plant consists of four American Blowers, being coupled in pairs and operated by one engine. The contract was one of the largest ever placed, and the heating department of the Ringen Stove Company are to be congratulated on the excellent test which their work has just passed through.

The following story was lately told by a distinguished scientist: A meteorite which fell on a farm in America was claimed by the ground landlord, as his lease reserved all minerals and metals. The tenant objected on the score that the article was not on the property when the lease was executed. The landlord then claimed it as flying game, but the lessee pleaded that the thing had neither feathers nor wings, and claimed it as ground game. But while the dispute was going on the customs officers seized the meteorite, on the ground that the revenue had been defrauded by its introduction into the country without payment of duty.

A cable dispatch from Berlin, Germany, states that the Government naval bill to be presented shortly to the German Reichstag provides for a total fleet of 19 sea going iron clads, 8 coast defense iron clads and 42 cruisers, an increase of 5 sea going iron clads and 9 cruisers. The additional expense involved is $39,270,000, the amount to cover seven years, by which time the new war ships are to be completed.

A dispatch from San Francisco, Cal., reports that the Rothschilds, through the San Francisco house of Liebes & Co., are about to enter the Alaska trade. Four steamers are now being built for them by W. H. Brick & Co. of the California Machine Works. These steamers are being constructed in sections, and when completed will be sent to Dutch Harbor, near Unalaska, to be set up. Four barges are also being built by the firm in sections, and will likewise be put together at Dutch Harbor. All of this work is being done for the Alaska Exploration Company, who were recently incorporated with a capital of $1,000,000, by the Rothschilds and other capitalists. Besides a general transportation business, the new company will establish trading stations and thoroughly explore the gold bearing country in Alaska.

An evidence of the return of agricultural prosperity is presented by the fact that scores of abandoned farms in Eastern Pennsylvania, which have not been cultivated for several years, have recently been rented and occupied, and to day it is reported that few of these properties remain idle In Berks County alone over 100 such farms, ranging in size from 10 to 75 acres, have lately been taken up, and the price of land has increased an average of 15 per cent. It is predicted that by next spring the "abandoned farm" will be entirely a thing of the past in that section of Pennsylvania.

SHEET METAL WORK.

SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS.—IV.

BY WILLIAM NEUBECKER.

COVERING STONE CORNICE AND FORMING GUTTER OVER SAME.

In Fig. 18 is shown the method of protecting the exposed part of a stone cornice, over which a gutter is formed under a mansard roof. A is the stone cornice, B the sheet copper forming the molding, with a lock at P, covering the stone work, with a beaded edge at F, and fitting into the square fillet of the stone cornice A. One-half inch round holes are drilled into the stone cornice at

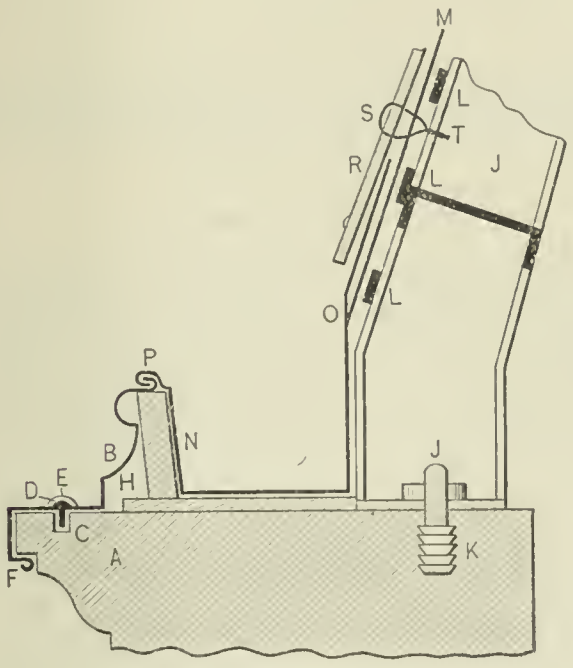

Fig. 18.—Section through Cornice

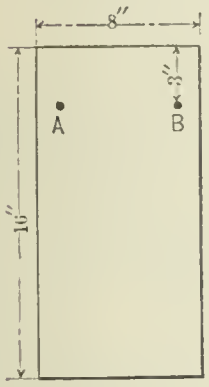

Fig. 19.—Slate Punched for Nails.

Fig 20.—Slate Punched for Wire Fastenings.

C at intervals of 2 or 3 feet and plugged with lead. Then the copper covering is nailed with brass nails into the plugged holes, as shown at D, and a concave copper cap, E, soldered over the nail heads.

In the previous chapters the method was given of fastening slates to porous terra cotta, but on some buildings having mansard roofs terra cotta is not used, the slates being fastened to corrugated iron covering as follows :

FLASHING AND SLATING ON CORRUGATED IRON COVERING.

Let J J in Fig. 18 represent the iron rafters fastened to the stone cornice at K, having iron laths L L L bolted or riveted to the rafter. On these laths the corrugated iron M is bolted. In this connection it is proper to remark that the corrugated iron should be galvanized and painted with two coats of good metallic paint before it is applied.

The wooden gutter lining H is now laid, after which the copper lining N is locked into the lock P and flashed over the corrugated covering as at O. To avoid any electrical action between the galvanized iron and copper a thick layer of two-ply asphalt paper should be laid between the copper and galvanized iron covering. The slating R is now laid, being fastened by means of copper wire 3-32 inch thick drawn through the slate and corrugated iron and twisted at the back with hand pliers.

In Fig. 19 is shown a diagram of an 8 x 16 inch slate, showing the two holes, A and B, which are used to nail slates to the boarding, terra cotta or fasten with wire.

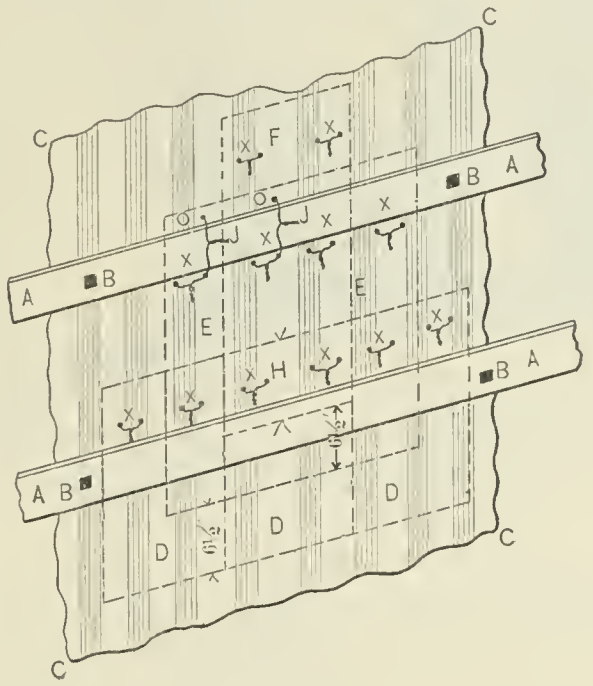

Fig. 21.—Back View of Slate Fastened to Corrugated Iron.

Some mechanics, however, use double holes to fasten with wire, as shown by C D and E F in Fig. 20. Slates are usually punched with the hand hammer, but the writer would suggest using a machine for punching slates, because the holes are almost the same as if they were drilled, while with a hand hammer the slates scale around the hole punched, leaving merely a shell.

Fig. 21 is a rear view of a mansard roof covered with corrugated iron, showing the method of twisting the wires on the inside. Let C C C C represent the corrugated iron covering, fastened to the iron laths A A, A A, by means of the bolts B B, B B.

Let D D D represent the first course of slates, fastened by means of copper wire, twisted on the inside, as shown at X X X, &c. E E represent the second course of slates, fastened in the same manner, laid 6½ inches to the weather (for 8 x 16), while F is the third course, laid the same amount to the weather, thereby overlapping the wires on the first course as much as is indicated by H. On the second course of slates E E the wires come under the iron laths A A. It is sometimes the case that the wires will come directly on the lath or other structure, in which case the hole would have to be punched to suit the conditions, as at O and O, and twisted as at J and J. When fastening slates to corrugated iron two persons are required, the mechanic on the outside and helper on the inside. By means of chalk and line the base line is snapped; the slate, which had been previously punched, is held in position by the slater, and by means of a long slender punch the size of the holes in the slate (⅛ inch) holes are punched through the corrugated iron, the wires bent U shape, passed through

the holes just made, and then twisted by the helper on the inside. It should be understood that it takes longer to describe the method of fastening than it does to put on the slate.

LAYING COPPER VALLEYS.

In Fig. 22 is shown an internal angle in a hipped roof, commonly known as a valley. When the roof is of slate, after the gutter is lined the valley is laid before the slating is commenced. Let A A represent the roof boards, B B the hip ridge and C C the copper valley, 7 inches wide each way, fastened to the roof by means of the cleats E E E E. A water lock, D D, is bent on each side of the valley, which prevents the snow or rain from getting under.

Fig. 23 shows the method of making a cross seam in a valley, the water flowing in the direction of the arrow E.

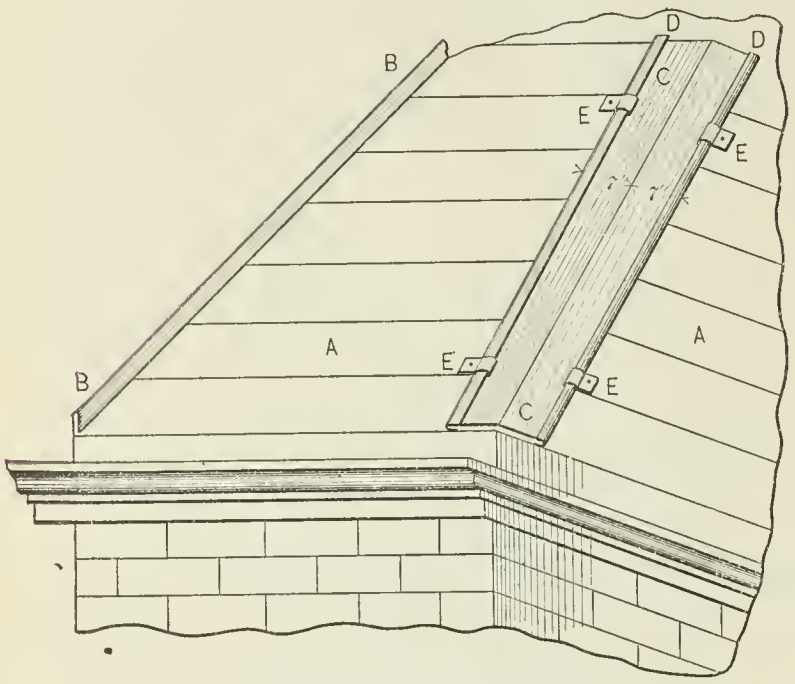

Fig. 22.—Laying Copper Valley on Roof.

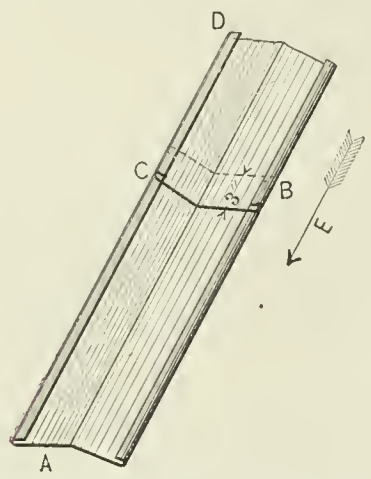

Fig. 23.—Overlapping Cross Seam in a Valley

Let A represent the lower piece and D the upper piece. The upper piece D will overlap the lower sheet A about 3 inches, as shown at C and B. Three inches of lap is sufficient to prevent the entrance of water, as the cross seams are not soldered, so as to allow for the expansion and contraction of the copper.

FLASHINGS.

The Tin shop of F. W. Gleason & Co., in the Savings Bank Building, Hyde Park, Mass., was damaged by fire on November 29.

The Mississippi Valley Roofing Company have recently been incorporated at St. Louis, Mo., with a capital stock of $20,000, by H. L. Block, R. E. Carr and P. S. Marquis.

The M. W. Powell Company, 926 and 927 Marquette Building, Chicago, Ill., send out with their compliments a little vest pocket book giving specifications for different kinds of gravel and composition roofs. The latter half of the little volume is left with blank pages for memorandum purposes.

A Sheet Metal Calendar.

Friedley & Voshardt, 194 and 196 Mather street, Chicago, manufacturers of architectural sheet metal ornaments, are distributing to their customers very tasteful wall calendars of which the accompanying cut is a good illustration. They are 7½ x 11 inches in size, made of heavily embossed steel, electroplated in copper. The cards for the perpetual calendar are held in a pocket in front. The firm are making special efforts to introduce sheet metal for ornamentation in work of this character.

A Sheet Metal Calendar.

They are making embossed sheet metal settings for mirrors and ornamental sheet metal work for hat racks and other purposes to which it can be adapted.

The Supply of Asbestos.

European manufacturers of asbestos goods are supplied, says *Engineering* of London, from four sources—viz.: 1. Canada, whence the asbestos is white, silky, very unctuous, having supple fibers from 5 to 25 mm. in length; of all varieties it is that which spins the most easily. 2. Siberia, whence the mineral is yellowish, some species being of a straw yellow. The fiber is less flexible and more woody, but stronger, than the Canadian, which it resembles in length; large masses of long fiber mineral being, however, rarer. 3. The Cape of Good Hope asbestos has a characteristic blue color. It occurs in larger masses than either the Canadian or Russian, and its fiber is generally longer and stronger. In spinning or other manipulation, however, it is difficult to handle, a good deal of the fiber being reduced to powder. 4. In Italy there are different kinds of asbestos, but generally they are little adapted to spinning. There are some long silky fibers of little resistance, employed for gas furnaces; others are very short and fit only to make heat retaining coverings.

Tests of Flooring Material.

The Boston *Journal of Commerce* gives the following interesting results of a thorough and careful investigation recently carried out as to the comparative durability of different flooring materials. In the tests an ordinary iron rubbing wheel was used, like that employed by stone workers for rubbing a smooth surface on marble or sandstone, and the samples to be tested were fastened to blocks of sandstone, laid face downward on the rubber wheel, which revolved at the rate of 75 revolutions a minute, being supplied with sharp sand and water. The blocks to which the floorings were cemented were of equal weight, so that the rubbing was effected under nearly the same pressure in all cases. Curiously enough, the material which resisted best this severe trial was india rubber tiling, which, after an hour's rubbing, lost only 1-64 inch of its thickness, and next to this, English encaustic tile gave the best results, losing only ⅛ inch in an hour's treatment. The artificial stone, known as "granolithic," was third, losing ⅜ inch, while North River bluestone lost 9-16 inch. All the marbles wore away very rapidly. A piece of marble mosaic disappeared entirely in 35 minutes, while solid white Vermont marble lost ¾ inch in an hour. Most of the wood floorings resisted abrasion better than the marble; thus white pine lost only 7-16 inch under treatment that removed nearly twice as much from solid marble, yellow pine about like white, and oak lost more than either of the pines.

The New York canal season of 1897, which has now closed, is reported as the worst on record, with the exception of that of 1895. The wheat shipments during the season reached 25,964,172 bushels, a decrease of about 11,000,000 as compared with last year, while the average rate of freight was only 2.8 per cent., as against 3.7 per cent in 1896. This year's rate on grain was the lowest on record with one exception.

THE RETAIL STORE.

Enameled Ware Consolidation.

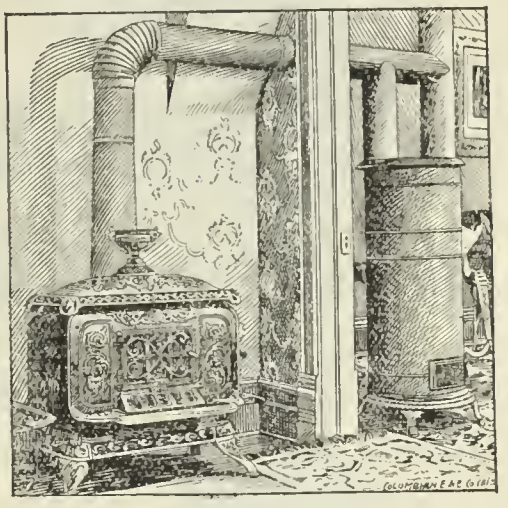
The movement looking to the consolidation of the greater number of the enameled ware manufacturers into one corporation is being actively pressed by those who originated the idea. Additional visits have been and are being made by principals to the various plants about the country for the purpose of determining a proper appraisement or ratio on which to absorb each interest. Meetings have also been held in New York this week in the same connection, leading officials of some of the Eastern and Western concerns being present. There is little doubt, however, that no agreement has as yet been consummated, the work so far being entirely of a preliminary nature. As now being considered, should the present plans be perfected the new organization will doubtless include all the concerns save one or two who are important factors, and, while not willing to join the enterprise, would be pleased to see it accomplished. The promoters of this project assert that they expect to make their profits by economies in purchases and production and in selling expenses rather than by advances in price. Among the trade, by those well informed, it is believed the harmonizing and absorption of so many conflicting properties will not be accomplished without considerable difficulty; nor is it believed that the contemplated consolidation will be effected in the immediate future. On the other hand, there is an impression that the prospects for an ultimate agreement are more distinct than they were a week ago.

An Incandescent Petroleum Lamp.

In *The Metal Worker* of October 30 we reprinted from an English exchange an illustration and description of an incandescent petroleum lamp just brought out by the Incandescent Gas Light Company, Limited, of London. Since publishing the account we have received a great many inquiries from different parts of the United States from readers who wish to know where this lamp could be obtained and if it was yet on the American market. We have written to the Incandescent Light Company, Limited, 14 Palmer street, London, England, who replied as follows: "The incandescent petroleum lamp is not yet on the American market, but will be shortly. We are preparing to sell the rights for this lamp in other countries, but are not in negotiation regarding the American rights. You will, of course, understand that it will be necessary for any one purchasing the rights for the oil burner to make arrangements with the Welsbach Company for the supply of mantles."

The Anderson Heating Drum.

In the accompanying illustration we show a heat saving device used in connection with a stove, which is being put on the market by the Anderson Heat Saving Apparatus Company of Marshalltown, Iowa. The drum consists of two cylinders forming a smoke chamber, with diaphragms reaching from the top nearly to the bottom between the inner and outer cylinders, and the method of attaching the smoke pipe to the drum may be readily seen from the illustration. In operation a damper between the two pipes which are attached to the drum gives a direct draft when the fire is first started. On closing this damper after the fire is in operation the products of combustion must pass down the branch pipe at the left into the cylinder, and then down to the bottom of the diaphragms, before it can pass up on the other side and find the outlet to the smoke pipe to the chimney. By this movement of the products of combustion both the inner and outer cylinders are heated. The cylinders are connected with a cast iron top and base resting on feet, leaving a space underneath the bottom so that the colder stratum of air along the floor may rise and come in contact with the hot surfaces of the two cylinders and keep the air in the room in circulation. By this means the colder air from the further points of the room is drawn to the heating drum, and after being warmed is discharged at the top, so that a continual current of warm air is provided to replace the cold air which is brought to the heating drum. A strong radiant heat is derived from the outer cylinder. It will be seen that this device uses no coal and is only a means of economizing heat that would be otherwise lost in the chimney. It is claimed by the manufactnrers that under test it has had an effect equal to a saving of 50 per cent. in fuel, and has been used in connection with heating and cooking stoves, hot air

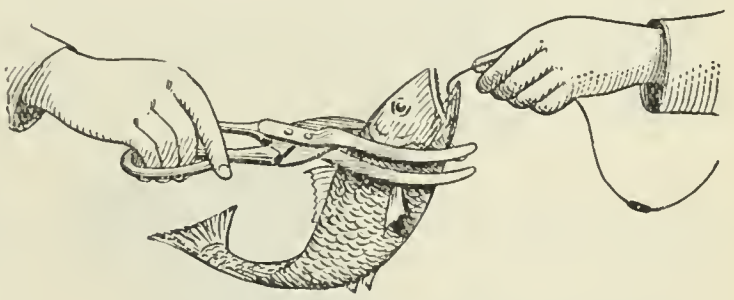


The Anderson Heating Drum.

furnaces and house heating boilers with excellent results. The company issue circulars giving full information in reference to construction and prices.

Koenig's Fish Tongs.

The Pure Aluminum Novelty Company, 15-21 Camfield street, Newark, N. J., are manufacturing Koenig's patent fish tongs, as here illustrated. They are about 9



Koenig's Aluminum Fish Tongs.

inches long, and being made of aluminum are very light. Used as shown in the cut they are convenient for holding any kind of fish when removing a hook and are equally serviceable in cleaning or handling fish, lobsters, crabs, &c., without soiling hands or clothing. They are light, strong and durable, weigh 4½ ounces and from the nature of the material will not rust or tarnish.

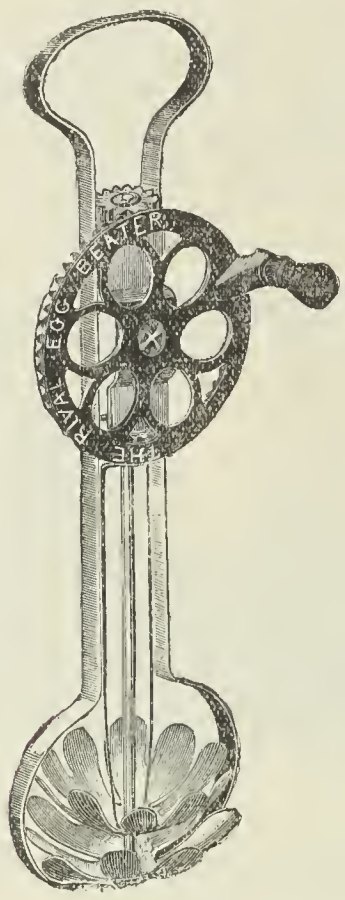
McCray Refrigerators.

Catalogues have been received from the McCray Refrigerator & Cold Storage Company, Kendallville, Ind. Catalogue No. 25 treats mainly of household refrigerators. These are constructed of hardwood and are built on the McCray patent system of cold storage. The walls are packed with mineral wool and an automatic circulation of cold air is secured by the internal arrangement. The company make the suggestion to those who contemplate building new residences to make allowance for a refrigerator or cold storage room. They furnish plans and specifications so that a refrigerator can be iced from the outside, avoiding the trips of an iceman through the house. A design of this kind is illustrated in the catalogue. Other special designs are shown, including large refrigerators or cold storage rooms lined with tile. Catalogue No. 30 is devoted to refrigerators for hotels and public institutions. This

comprises 20 pages and shows full plans and details of a number of cooling rooms, built for prominent asylums and other establishments requiring extensive facilities of this character.

The Rival Egg Beater.

The accompanying cut represents an egg beater put on the market by the Standard Company, 107 Haverhill street, Boston, Mass., as an addition to their line of beaters. The construction of the article is somewhat

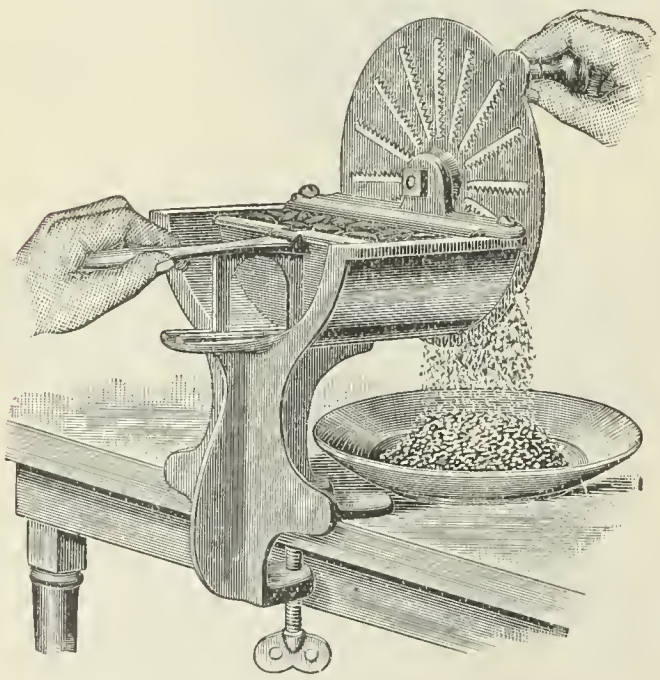


The Rival Egg Beater.

different from others on the market, this being particularly noticeable in the form of the revolving beaters. The company claim exceptional working qualities for the beater.

Champion Grater.

The Specialty Novelty Company, 43 East Marion street, Lancaster, Pa., have brought out the Champion grater, here shown. It is exceedingly simple in construction, and



The Champion Grater.

designed for grating cocoanut, walnuts, almonds, chocolate, horseradish, vegetables, cheese, crackers and a number of similar commodities freely without clogging. After the material is placed in the receptacle it is forced against the toothed disk by a pusher operated by the other hand. The grater is tinned and can be clamped to table, &c. Allerton-Clarke Company, 97 Chambers street, New York, are general agents, and C. B. Corwin, 15 Whitehall street, this city, handles the goods for export.

Shelving Near the Ceiling.

Herewith is shown an arrangement of shelving supported by gas pipe erected in the Hardware store of M. E. Coffee, Burnet, Texas, to utilize the space near the ceiling. For this purpose 1¼-inch gas pipe was used, making the uprights long enough to reach from the floor to the ceiling, with flanges on both ends which were fastened by screws at each end. The cross pieces of pipe screwed into the tees, upon which the shelves rest, are 12 inches long, and so extend about 1 foot over the showcase

Shelving Near the Ceiling.

and the same distance over the aisle behind the counter. The boards are notched to fit around the uprights. The floor space occupied is but 3 inches, the diameter of the flanges. Six feet between the uprights is mentioned as a desirable distance to place them. The shelves were put on both sides and across the rear of the store, and are reached by traveling ladders. It is stated that the cost of the shelving was between 15 and 20 cents per running foot, not painted. The cross pieces over the counter could be made longer if desired and utilized for hanging goods on.—*The Iron Age.*

The time is not far away when the trade will have an active interest in everything relating to maple syrup, and as a good preparation they would do well to secure a copy of Catalogue A, issued by J. M. & L. A. Osborn, Cleveland, Ohio, who are jobbers of Maple Sap and Syrup Men's Supplies. The catalogue, which is nicely printed and copiously illustrated, shows all sorts of syrup goods, both those relating to the collection of the sap and the shipping of the syrup, while the end of the catalogue calls attention to Tin Plates, Roofing Plates, Enameled Ware, Sap Pan Iron, &c.

The Gannaway Hardware Company, Louisburg, N. C., have sold out their business to the Louisburg Hardware & Supply Company. The officers of the new company are J. J. Barron, president; W. L. Paynes, vice-president and general manager, and J. S. Barron, secretary and treasurer. A wholesale and retail trade is done in Shelf and Heavy Hardware, Stoves, Tinware, Implements, Sporting Goods, &c. The new firm advise us that they have largely increased the stock formerly carried and are in better position to handle business than heretofore.

South Dakota Retail Merchants' Association.

The South Dakota Retail Merchants' Association, which was organized in July last, is meeting with gratifying success in its effort to interest the retailers of the State, and we are advised that it now has a membership of 324, with local unions in 25 towns. The association covers retailers in all lines, including Hardware, and its objects are to take such measures as will keep the retail trade at home, which is now divided between the retail merchants of the State and catalogue houses in the large cities; to establish a bureau through which all information of value to the retailers of the State in general can be imparted; to be the medium by which retail merchants may become acquainted with each other and so put themselves in a position to work unitedly, and to prevent fraudulent failures and all forms of fraud.

The association has obtained satisfactory results, young as it is, in the way of enforcing the peddler license law and in other ways. An active campaign of education, for the purpose of teaching customers that it is to their interest to buy of their home merchants, will be inaugurated as soon as the standing Committee on Press and Literature can be organized. The chief purpose of the organization is to prove to the public that it pays them much better to trade at home than to give any patronage to outside concerns.

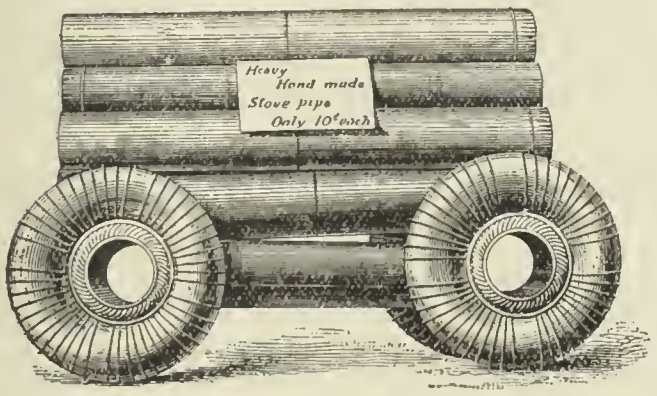


Fig. 2.—A Carload of Pipe.

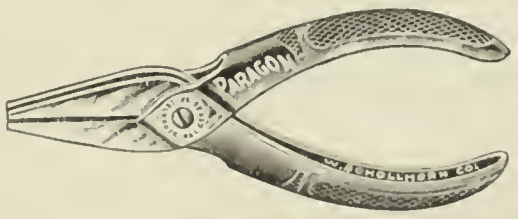
Paragon Flat Nose Pliers.

William Schollhorn Company, New Haven, Conn., have brought out the Paragon flat nose pliers, here shown.



Paragon Flat Nose Plier.

They are stamped from sheet steel and the jaws are tempered. They are made in 4, 4½, 5, 5½ and 6 inch sizes, nickeled, fully warranted and are moderate in price. In New York the goods are carried in stock by Underhill, Clinch & Co., 94 Chambers street.

Locomotive and Car.

The accompanying cuts show an ingeniously arranged locomotive and car constructed by the Barrett Hardware Co. of Joliet, Ill., for display in their show window. The articles used in building the locomotive, Fig. 1, were as follows: The boiler was an 8-gallon Milk Can; smokestack, two 2-quart Tin Cups with two pint Basins on top; head light, a Police Lantern; bell, a Hand Bell; boiler rests, deep Drip Pans; axles, 1-inch Machine Bolts;

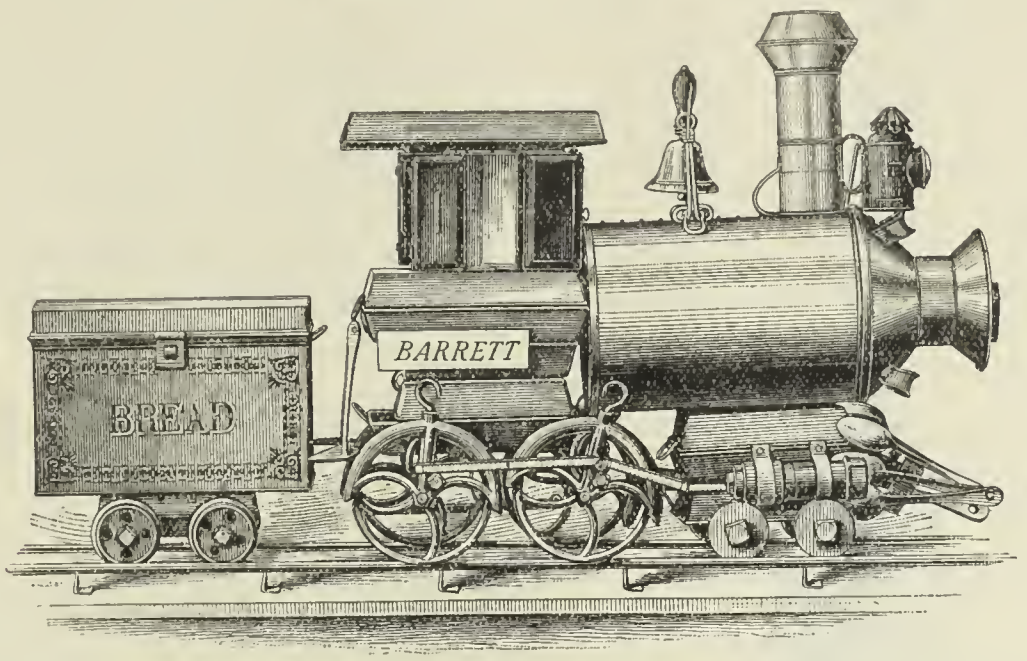


Fig 1.—A Western Locomotive.

front wheels, 1-inch cast Washers; driving wheels, Well Wheels; cow catcher, Basting Spoons; piston, 2-foot Rule; steam cylinder, a 2-inch Nipple with a cap on one end and bushing on the other. The cab was made up of four deep Roasting Pans, Folding Lunch Boxes, with a shallow Drip Pan on the top for the cover; tender, a Bread Box on four Hay Carrier Wheels; ⅝-inch Bolts for axles, with babbitt metal resting on the axles to carry the Bread Box. T Barn Door Rail answered for track. The car, Fig. 2, had wheels composed each of four Elbows, with 6-inch Stove Pipe shoved through them for axles, while a Pipe Collar at each end gave an artistic finish. On this car was piled Stove Pipe. The articles chosen for the construction of the train, especially for the locomotive, were admirably adapted to their purpose. The exhibit attracted a great deal of attention and elicited much favorable comment.

U. T. Hungerford.

U. T. Hungerford, dealer in Brass, Copper, &c., goes from 29 Chambers street to 121 Worth street, New York, where he has taken the whole of a six-story building as a headquarters for everything in his line

The house in question aim to carry the largest and most complete stock in the country in their particular line, and for this reason are enabled to fill orders very promptly. Mr. Hungerford is favorably known to the trade throughout the country as the former New York representative of Wallace & Sons, Brass and Copper manufacturers, of Ansonia, Conn., who discontinued business about one year since, and has associated with him George Davidson, Bernard Ris and J. R. Van Brunt, who were with the old house of Wallace & Sons for many years.

With the exception of one floor the whole of the new building will be used for the warehousing of his large stock of Brass and Copper goods.

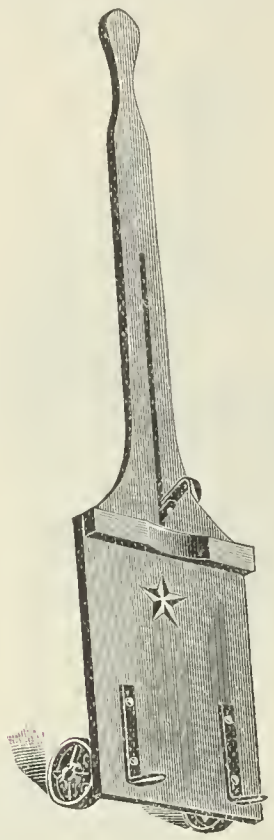
The other floor will be used exclusively for office and showroom purposes. The location is an excellent one for this line of business, and the firm not only secure more room by the change but also much better facilities of every kind.

Cooper & McKee, Brooklyn, N. Y., are running their Refrigerator factory full force, accumulating a large stock in anticipation of heavy orders with the opening of their season, January 1. Since last season they have built another four-story brick warehouse and with their increased storage facilities can more fully carry out their policy of keeping a large stock on hand for prompt shipment. They advise us that theirs is now one of the largest plants in the country and that their trade, covering the Eastern, Middle and Southern States, is satisfactory. They also men-

tion that their export trade during the past year was larger than ever before. The company manufacture full lines of both hard and soft wood Refrigerators.

The Star Truck.

Boston & Lockport Block Company, Boston, Mass., are putting on the market a truck as shown in the accompanying cut. It is made of selected ash, with a steel axle, having wheels 3¾ inches in diameter. Metal points are



The Star Truck.

provided to keep the load in its place, and a hook to grip and hold a barrel or cask. The truck is designed for use in stores, about barns and in dwelling houses, especially for handling barrels, but also for boxes, bundles and other articles. The truck is designed to retail for $1.25 each.

MEMORANDA.

The Stove Dealers' Association of Washington, D. C., recently held a meeting at which President Harrover presented an encouraging report on organization. The Committee on By-Laws also submitted a report which was read and approved. During the session an interesting discussion took place concerning four important business factors—the manufacturer, the wholesale dealer, the retail dealer and the consumer. According to the reports it appeared to be the sense of the meeting that "a proper observance of business principles by dealers would insure an equitable distribution of patronage from consumers and the result would be beneficial both to employer and employed." S. S. Shedd & Brothers, Dodson & Hodgson, P. G. Lauer, W. H. Mehler and Barber & Ross were appointed a Committee on Organization.

The Kansas City Tin & Repair Shop Company, Kansas City, Mo., have been incorporated, with a capital stock of $10,000.

Anderson Bros. have started a new Tinware store at Springfield, Minn.

H. Rogers is building a new Tinware store at Maynard, Iowa.

A new Tinware store has been opened by J. Burr, at Martin, Mich.

In their advertisement elsewhere in this issue, McClure & Co., 211, 213, 215 Second avenue, Pittsburgh, Pa., direct attention of the trade to certain sizes of Heater Pipe Tin which they have in stock. This Tin is of the Cupola brand, and is referred to as possessing superior quality and finish. We understand that the firm are prepared to make attractive prices on these goods.

The Quintette-Bell Mfg. Company, 103 North Second street, St. Louis, Mo., issue circulars in the interests of the Star Metal Polish, which they state is warranted to contain no acid or poison, and is adapted for cleaning and polishing silver, nickel, brass, copper, tin, &c. A number of testimonials speaking in the highest terms of its excellence are presented. The same firm also make the Star Cleaner, a soap for cleaning and polishing bathtubs and stop cocks, stone and marble, &c.

Every department in the large factory of the Lalance & Grosjean Mfg. Company, at Woodhaven, Long Island, N. Y., is actively employed at the present time. The firm report a very satisfactory demand for their products, orders being received in a large and steady volume not only from this country but from abroad. This week two large foreign orders for Enameled Ware were filled, one from Tokyo, Japan, and the other from Adelaide, South Australia.

Luck & Phelps, Hardware and Stove merchants, dealers in Firearms, Cutlery, &c., at Salisbury, Mo., have dissolved partnership. The business will be continued by J. W. Luck.

The Wells & Nellegar Company, wholesale Hardware merchants, 72 to 76 Lake street, Chicago, have secured a number of the prominent salesmen hitherto connected with John Alling & Co., and have thus enlarged their force of traveling men. It was an excellent opportunity to work into new trade, as it is expected that the salesmen will be able to influence a very considerable part of the business which they have been doing in the interest of John Alling & Co., now that that house have passed out of existence.

Henry N. Whittemore is successor to Daniel Latham in the wholesale and retail business, 141 and 143 State street, New London, Conn. The large stock carried comprises Hardware, House Furnishing Goods, Electrical Supplies, Oils, &c. Mr. Whittemore contemplates enlarging the stock and making a number of improvements in the store.

Geo. C. Miller and Oris Wentworth have opened up in the Hardware business, at Unionville, Mo., under the style of Miller & Wentworth. Their stock comprises Shelf and Heavy Hardware, Tinware, Stoves, Agricultural Implements, Wagons and Buggies, &c. They are occupying a building which, they state, has been remodeled and is now up to date in every particular.

Johnson & Chenoweth have embarked in the wholesale and retail Hardware and Implement business at Shoals, Ind. They are also carrying Stoves, Tinware, Wagons, Buggies, &c.

Frederick P. Manning has opened up a Hardware store in the Foote Building in Warrenville, Ill. Mr. Manning is carrying a line of Shelf Hardware, Stoves, Tinware, Galvanized Steel Roofing, &c. About December 15 he will commence the manufacture of Grain Purifiers and other specialties of his own invention.

C. I. Stoner, West Alexandria, Ohio, has sold a half interest in his business to Sherman Mills, who will become a partner January 1. Paints and Oils, &c., will then be added to the present stock of Hardware, Stoves and Tinware.

Howard N. Stillman has lately opened up in business at Stewartville, Minn., handling Hardware, Sporting Goods, Tinware, Bicycles, &c.

I. T. Morgans & Son, Parkersburg, Iowa, have sold their general Hardware, Tinware and Plumbing business to Morgans & Ehler, who will continue at the old stand.

C. M. Dennis, who has been in the Hardware business in Edwardsburg, Mich., since April, 1886, has just completed a new store, which provides much better facilities than the old. Mr. Dennis is accordingly carrying a larger stock of goods. His line embraces Shelf and Heavy Hardware, Tinware, Agricultural Implements, Sporting Goods, &c.

Clark & Gallup have bought out Henry E. Iseman's Hardware business in Prattville, Mich. The line of goods comprises Hardware, Agricultural Implements, Builders' Material, Stoves, &c.

John K. Ofsthus has succeeded W. I. Brebner in the Hardware and Stove line at Northwood, Iowa.

The Hardware firm of McIlwain & Kaylor, Warren, Ind., have dissolved partnership, and O. F. McIlwain & Co. are now conducting the business at the old stand. Shelf Hardware, Stoves, Tinware, Sash, Doors, &c., are handled.

A new automatic mail box for registering letters, known as the Di Brazza letter registering machine, is being tested in the Post Office in New York City. Three of the boxes are in use at present. By dropping a dime into a slot in the box, sliding a letter into another aperture and turning a handle on the machine, a registered receipt for the letter is passed out.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Wholesale prices have receded slightly under the influence of slack demand and liberal importations. The new supply, in fact, has exceeded the outlet and caused rather more pressure to sell in some quarters. The importations during the month amounted to 1770 tons. Speculation remains lifeless in this quarter and operations in London have, to all accounts, been on a smaller scale than for some time past. Retail sales were on a similarly modest scale, but no change was made in jobbers' quotations, which for small lots from store are 14¾c. per lb. for Straits Pig. The visible supply of Tin as posted on the Metal Exchange compares as follows:

	Dec. 1.	Nov. 1.	Oct. 1.
1897, tons	30,461	31,037	31,875
1896, tons	33,303	33,423	35,417

The stock in the United States December 1 is estimated at 3790 tons, 4020 tons November 1 and 3415 tons October 1.

Copper.—The market has remained in rather dull condition, with no redeeming feature outside of continued heavy consumption on the Continent, particularly of Wire Bars. Other foreign markets are taking merely fair quantities of the metal and the home trade demand continues tame, although a slight improvement was noted at the close. Values have undergone no radical change, but appear rather weak. Small lots from stock remain at about 12c. to 12¼c. per lb. for Lake Ingot and 11c. to 11¼c. for Ansonia Grade Casting Copper.

Sheet Copper.—Nothing beyond a perfunctory demand for comparatively small quantities for present use is reported. The requirements of cornice makers are pretty well filled for the season and the near approach of stock taking time disinclines dealers and consumers from buying more material than they actually need. Prices are not very firm, but jobbers continue to quote small lots from store on the basis of 15c. per lb.

Pig Lead.—What there was in the way of sign of improvement at the date of last week's report has given way to dullness and prices have weakened slightly. The buying is at present extremely conservative and confined chiefly to small lots for early delivery. American Pig in small parcels from store is quoted at 4⅛c. to 4¼c. per lb.

St. Louis advices are as follows: The Pig Lead market is dull but firm. There are rumors of a proposed combination and that smelters are in session in New York City with a view toward forming some arrangement to restrict production. There is a continued effort on the part of speculators to get into the market, but sellers of large quantities are hard to find.

Spelter.—There has been no improvement whatever in business here or in the demand and the market continues unsettled, with rather weak undertone. Ordinary Western brands are selling in a retail way at 4.65c. to 4.75c. per lb.

St. Louis advices report no change in the market for this metal. Continued dullness tends to depress the price.

Sheet Zinc.—A moderate demand exists of very ordinary type. Prices are unchanged. Jobbers quote 600-lb. cask lots at 5⅝c. to 5¾c. per lb. and smaller quantities at 6⅛c. to 6¼c.

Antimony.—Business has been moderate but prices remain steady at 7¼c. to 7½c. for Japanese, 7¾c. for Hallett's and 8½c. for Cookson's in small parcels from store.

Nickel.—The market remains steady at about 37c. to 38c. for small quantities.

Aluminum.—There is no change in this metal, for which there is a comparatively steady demand. Present prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—There has been no improvement whatever in business in American Plates. The market remains in a rather unsatisfactory condition, with forward deliveries about 5c. a box cheaper than spot stock. Large consumers are understood to have covered their probable wants for the first two or three months of next year and are holding off buying further ahead in the expectation of securing lower rates. At the same time the mills are nearly all running full and are believed to be well supplied with orders for a couple of months or so, while few are pressing sales in this quarter. Stocks are light and deliveries are still delayed. No expansion in the demand is looked for, however, for the balance of the year nor during the opening weeks of 1898. Consequently there is little ground for the hope of higher prices in the immediate future. The large additions to the producing capacity now under way, and which apparently will have to be reckoned with in 1898, tend to foster a nervous feeling in the trade and discourage large consumers from contracting for deliveries ahead. It is argued that the American production of Tin Plate this year has been about even with the consumption, which has been fairly liberal, and as there is no ground for anticipating such a large expansion in next year's consumption as will absorb the materially increased output of the domestic mills the result must be the usual one incident to overproduction—namely, sharp competition and lower prices. Some authorities in the trade take a more favorable view of the situation, however. They assert that the added capacity introduced by the mills now building will cut no figure to speak of in next year's market, as the larger portion of the new mills cannot be completed and ready for taking orders before the latter half of the year, when the canners' and can makers' requirements will have been filled. They look for a larger demand than usual from those interests next spring and summer, as stocks of canned goods are quite light and, in some cases, will barely suffice to meet the demand. The retail trade in Tin and Terne Plates has been very tame, as is usual at this season. Jobbers' quotations are unchanged, moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore being about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do. 95 lbs., $3.35 to $3.45; do., 90 lbs., $3 30 to $3 40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are selling slowly outside of the export goods trade.

Chicago advices are as follows: Ternes are quiet, but a rather better inquiry is reported for Cokes. Manufacturers are now making prompt shipments, so that the trade is well supplied. Regular quotations are $6.10 for a good quality of Ternes in carload lots and $3.05 for Full Weight Cokes, but it is reported that a few manufacturers are anxious to secure business for deliveries extending well into next year and have made some concessions from these rates.

A special London cable dispatch of December 1, 1897, reports on the British Tin Plate market as follows: Tin Plate steady on the basis of 9s. 6d. to 9s. 7½d. for 14 x 20 Bessemers, and 9s. 7½d. to 9s. 9d. for Siemens, f.o.b. Swansea.

Sheet Iron.—The demand for thin Sheets continues good, but there is not much inquiry for the heavier kinds. Galvanized Sheets sell in moderate quantities only. Prices are fairly firm, but concessions are made by jobbers on attractive orders. Small lots from stock sell in this section at about 2.35c. to 2.40c. for No. 27 Common Black Sheets and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanied Sheets.

Chicago advices are as follows: Some demand is reported for mill shipments of Black Sheets. The works are full of orders and prices show no weakness. Galvanized Sheets, on the contrary, have gone off slightly, notwithstanding the much better volume of business. Small lots from stock are unchanged at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—Extreme quietness continues to rule in the domestic market with values unchanged. The export demand is also very light. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.

Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10 50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

THE IRON MARKET.

The interest in the negotiations for a consolidation of the Wire interests has overshadowed current trade developments, which have not been significant. The Wire trade seem to have quite widely come to the conclusion that it is wise to cover requirements as a hedge against the possible success of the movement toward consolidation, and many sellers have promptly announced a withdrawal of old quotations.

Some of the steel works in the Central West have been buying Bessemer Pig Iron. Steel Billets have been very quiet East and West. The feeling is gaining ground that we must go through our usual slackening of activity during the first quarter of the year, but the feeling of buyers is indicated by the desire now cropping up to couple purchases for next year with demands for delivery during as long a period in 1898 as is possible.

Pig Iron.—In New York, while in some quarters a little better movement is noted, other sellers report dullness and a tendency to accept slightly lower prices. One of the Eastern Pennsylvania foundries has during the week purchased about 9000 tons for prompt delivery. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11 25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

The Philadelphia Pig Iron market is reported as extremely quiet, buyers showing no disposition to do anything in the way of new contracts. So far prices have been steadily maintained, but some holders are getting a little restive and unless the demand improves it will be difficult to keep them in line. Consumers appear to be doing very well, and while they are not buying, they are certainly taking large lots of contract Iron. It is a waiting market, and one that will be closely watched, because of the large interests involved, although the market is believed to be perfectly safe for a long pull. To-day's quotations are about as follows for seaboard deliveries, subject to the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

Sales agents in the Chicago market report increasing business in sight. Sales have been made of moderate quantities of local Foundry and Bessemer Iron and Southern Foundry. The largest contract taken was probably for 1000 tons. Inquiries now in hand call for somewhat larger amounts and for deliveries extending through a considerable part of the coming year. The better inquiry leads to the belief that quite a volume of business will be done in December. Consumers have latterly been making a test of the market to develop if possible weak spots. Some of them report weakness in Southern prices to local sales agents and weakness in local prices to Southern agents, but so far as can be ascertained all prices are fully as firm as they were 60 days back, when the market was quite active. Lake Superior Charcoal has been sold in small lots only. We quote for cash as follows:

Lake Superior Charcoal	$12 50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

There have been some heavy sales of Bessemer in the Pittsburgh district, for December delivery, but otherwise little change has occurred in the market during the week. We quote, f.o.b. Pittsburgh, as follows: No. 1 Foundry, $10.65 to $10.75; No. 2, $10.15 to $10.25; Bessemer, $10.15.

In the Cincinnati district, business has been quiet so far as new orders are concerned. The daily run of small lots has been about what might have reasonably been expected, with the aggregate fairly satisfactory for a dull season. Iron is going forward rapidly, and there is evidence pointing toward the seeming fact that furnaces will be ready for the buyers when buyers are ready to try the market. Price lists both as to Southern and Northern Pig are nominally unchanged and presumably steady. What few ales are quoted at less than standard quotations are found upon investigation to have some qualifications which render them unfit to base a market opinion upon. Quotations are as follow, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The St. Louis Pig Iron market is extremely quiet, but prices are being well maintained. Sales are few and confined to carload lots for immediate delivery, with an occasional order for 100 tons. Stocks in both consumers' and producers' hands continue to be reduced, which explains the strength exhibited by prices. Efforts to shade the market for delivery extending into next year have proved unsuccessful, and nearly all furnaces are a unit in refusing to accept business for delivery later than February. The market is in a fair way to advance. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—Dealers appear to be the only ones interested in buying old material at present. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5 50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9 c.
Red Brass	....	7½c.
Yellow Brass	....	6½c.
Light Brass	....	4 c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—Sales are light and prices are being cut. The card on carload lots of 12 tons minimum is now as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

The banking firm of Alexander Brown & Sons, Baltimore, Md., are reported to have closed a deal whereby the capital stock of $20,000,000 of the Pittsburgh Traction Company, embracing 117 miles of street railways, has been transferred to a syndicate of capitalists in London, New York, Baltimore and Philadelphia.

THE HARDWARE TRADE.

With the opening of December it is anticipated that there will be a falling off in the volume of business and that the general line of goods will be somewhat neglected. The demand for seasonable articles and holiday goods, however, in some measure makes up for the diminished business in other lines, and from some sections of the country reports indicate that in these departments there is very little reason for complaint. There are also indications of a somewhat better demand in a few lines, and the tone of the market on the whole seems to be at least as good and perhaps a little better than a week ago. The most important matter affecting the interests of the trade at large is the effort being made for the consolidation of Wire Rod interests and the resulting control of the manufacture of Wire products. These negotiations are being vigorously prosecuted, and while thus far the matter has had but little effect on the market, it is apparently beginniug to attract the attention of merchants, who realize the possibility of the successful carrying out of the plans. There has not been sufficient faith in the final success of the enterprise to lead buyers to enter the market at all freely in anticipation of advanced prices, but as we go to press its effect on the market is apparent. In other respects the market remains substantially as before. Manufacturers are generally pursuing a conservative course and are not attempting to force business by low quotations. This is in part owing to the hopeful view of the future course of trade and the expectation that goods can safely be held until spring, when possibly better prices may prevail. The market will naturally be closely watched for the next month or two, when in many lines manufacturers will have an opportunity to accumulate stocks for the business of the coming season. There is an evident improvement in collections, and the trade enters on the last month of the year in good condition and with hopeful anticipations for 1898.

Advices from Chicago.—The Shelf Hardware trade improves instead of falling off, as might be expected at this time of the year. The severe winter weather has stimulated trade considerably. The activity is expected to extend over at least the first half of December. The demand for Skates, Sleigh Bells, &c., has been light until now, but it has suddenly awakened, and telegraph orders for Skates have been received within the last few days. Mail orders for all kinds of Shelf Hardware have increased considerably of late. The demand for Tinware and Metals has fallen off somewhat, but this is usual at this season. Jobbers are now making preparations for taking inventory. The consolidation of Wire interests under negotiation excites much interest in the local Hardware trade, but it is not stimulating business to any appreciable extent. The magnitude of the project causes general doubt among Hardwaremen that it can be consummated, notwithstanding the favorable reports in circulation. Heavy Hardware jobbers report that November went out with flying colors. Sales for the month ran ahead of those for October, and many back orders are carried into December. The trade is certainly much better than usual at this season. Collections are very good in all lines.

Advices from St. Louis.—The Hardware trade is reaching that point where it runs largely to odds and ends to sort up. The time for annual inventories is close at hand and dealers are allowing their stocks to run down as much as the circumstances will permit. Holiday goods have sold very freely—better, in fact, than for several years past. The cold weather at present prevailing has stimulated the demand for seasonable goods, and rush orders are now the order of the day. Tin Plate and Black Sheets are both selling freely, but prices are anything but satisfactory, especially on Tin Plate. Shot is very active, and considerable interest attaches to this department on account of the prices quoted by a local manufacturer. Shelf Goods are in mod erate demand, while the demand for Builders' Hardware has fallen off to practically nothing. Machinists' Supplies, however, continue to be ordered very liberally. The tone of the market is not quite so strong, and although there are no radical changes in prices there is more or less of a desire on the part of the manufacturers to secure orders, and they are willing to shade prices to get them. Collections are satisfactory.

NOTES ON PRICES.

Wire Nails.—During the past week the market has been firm. The fact that negotiations are in progress for the consolidation of Wire Rod interests evidently has influence on the manufacturers at least in preventing them from yielding in price, inducing them to take the view that it is better to hold the Nails so as to be in a position to meet the large demand which is anticipated, and perhaps to realize better prices on the Nails than if disposing of them at any concessions from current quotations. There are indications of an anxiety on the part of buyers to cover their requirements, and a good many orders and inquiries have been coming in to manufacturers and their representatives. The manufacturers, however, are holding off, naming somewhat higher prices and refusing to accept orders for future delivery. New York quotations have been $1.60 to $1.65 for small lots from store.

Advices from Chicago.—Manufacturers are not pushing for business, but are evidently waiting to see the result of the negotiations for control of the Wire trade. A few inquiries have come up recently, which are presumably prompted by reports of the negotiations, but as far as can be ascertained no heavy contracts are being placed. Jobbers are still making prices to move their stocks and quote $1.45 to $1.50, according to character of the order and the accompanying bill of goods.

Advices from St. Louis.—The market is easier but the demand is very satisfactory. Large quantities have been shipped to Colorado points on account of the cut in freight rates, and the local market is relieved considerably in consequence of these sales. Jobbers report an excellent demand and are quoting $1.55 to $1.60, base, for small lots from store.

Cut Nails.—There is little of interest to note in the Cut Nail market. Prices are unchanged. The volume of business is small. New York quotations for small lots from store are $1.35 to $1.40.

Advices from Chicago.—Not much is doing in Cut Nails, which continue to be quoted at $1.45 in small lots from stock.

Advices from St. Louis—Continued weakness is noticed in this department. Jobbers report a fair trade only at $1.40, base, to $1.45, for small lots from store.

Barb Wire.—Under the influence of negotiations for combining Rod interests the market is decidedly firm, and some mills are refusing to accept orders for future delivery.

Advices from Chicago.—Trade is quiet in every direction. The Southwestern demand has not been so heavy as was expected. The trade is also light in other quarters, although some advance contracts are now being made for spring shipment. Prices are unchanged at $1.55 to $1.60 for Painted and $1.85 to $1.90 for Galvanized in small lots from stock.

Advices from St. Louis.—The demand for Barb Wire is light and manufacturers look for no improvement until after the turn of the year. Prices are fairly well maintained. Jobbers report sales as being light, and quote $1.55 to $1.60 for Painted, with 30 cents per hundredweight additional for Galvanized.

Smooth Wire.—There is but comparatively little doing in Smooth Wire. Quotations remain as before. In some cases, however, these prices are slightly shaded.

Carriage Bolts, Machine Bolts, &c.—Manufacturers of this line of goods report a good business and refer to the outlook as promising. While there is no rigid agreement between the manufacturers as to prices, the market is in better condition than a month or two ago and prices are on the whole pretty regularly maintained.

Wrought Iron Pipe.—The manufacturers of Wrought Iron Pipe are experiencing some annoyance from the competition of jobbers who purchased at lower prices than are now ruling. While the leading manufactnrers are maintaining prices steadily, this causes a slight irregularity in the market.

Galvanized Iron Range Boilers.—Dealers report the demand for these goods as quiet and prices somewhat weaker. The ruling retail discounts off the list for Boilers here are as follows:

	Per cent.
Galvanized Iron Range Boilers to and including 52-gallon,	75 and 10
" " " " above 52-gallon..... ..	70 and 5
" " " " Extra Heavy, to and including 52-gallon	70
Galvanized Iron Range Boilers, Extra Heavy, above 52-gallon.....	70

Plumbers' Earthen Ware.—As usual as this time of the year, the demand has fallen off to a considerable extent. The outlook is regarded as favorable to an improved business in the coming spring. Dealers quote a disconnt of 60 per cent. on the list of December 9, 1895.

Glass.—There is nothing new to report in the Glass sitnation, as the conferences held between manufactnrers and workmen have not resulted in any agreement as to the wage scale for the coming fire. The differences were not great, as both sides made concessions, and much disappointment was felt by the workmen and by some of the manufacturers. Nothing of interest has transpired in the

local market, and business continues quiet. Prices remain unchanged and are as follows: For less than carload lots the New York price is 60 per cent. discount. Chicago price for like quantity is also 60 per cent. discount. Imported Glass is quoted at 60 and 10 per cent. discount.

White Lead.—Corroders report about the usual business for the season in Dry White Lead, the greater portion of which was in the form of contracts for next year's delivery. The movement of Lead in Oil has been fair, but chiefly moderate quantities for early deliveries. Old list prices are still quoted by corroders, but jobbers sometimes shade the official rates when desirable miscellaneous orders may be captured through such action.

Red Lead.—Sales to quite good amount have been made for prompt delivery and some orders are being placed for next year. The business is only fair in volume, however, and mostly at former prices.

Linseed Oil.—Except that there has been a further advance in the price of raw material there is no change in the situation. The demand for Oil is only fair, and slowness of sales doubtless prevents an advance in prices. The tone of the market is strong.

Spirits Turpentine.—Business of quite extensive value has been put through here and at Southern points, and the market is firm, with prices at 34c. to 34½c. for retail quantities.

Old Paper, Rags, &c.—A fair business is being done, with no quotable change in prices. Dealers are paying about the following rates for New York city delivery:

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅞c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 3/5c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅝ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅝ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures:

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

TRADE NOTES.

The Mossberg & Granville Mfg. Company of Providence, R. I., have opened a store at 126 Liberty street, New York, where samples of nearly all the machines which they manufacture can be seen, with a salesman in attendance, and have also opened a branch at the Philadelphia Bourse.

A factory for the manufacture of Aluminum Goods is a new industry at Hillsdale, Mich.

The Ohio Brass & Iron Mfg. Company, Cleveland, Ohio, are about to erect an addition to their plant to cost $7000.

The Thomas Brass & Iron Company, Waukegan, Ill., have begun the erection of a new foundry building 60 x 200 feet. The addition was rendered necessary by a large increase in the company's business of late.

We have received from George H. McKay, Cranston Hill, Glasgow, Scotland, illustrated circulars of McKay's Patent Steel Combination Table Leaf Bracket and Hinge, intended for tables of all kinds, folding seats, shelves, &c. This combination has been patented in this country and abroad, and we understand the American patents are for sale.

The North German Lloyd Company's champion ocean liner, the "Kaiser Wilhelm der Grosse," has again broken records in her last eastward voyage. The vessel made the quickest run from New York to Southampton, covering the distance in 5 days 17 hours and 8 minutes, or in 17 hours and 6 minutes better time than the previous record voyage, that of the American liner "St Louis." The "Kaiser," moreover, covered the 3065 knots of the trip at an hourly average speed of 22.35 knots, beating the best previous hourly average, that of the Cunarder "Lucania" on her voyage between New York and Liverpool in May, 1895, by 0.34 knots. She thus holds all records which it is possible to compare with other Atlantic steamships. In future she will only have to break her own records.

The State Agricultural Department of Kansas gives this year's wheat yield of that State as more than 51,000,000 bushels, valued at $34,000,000, an increase of 160 per cent. over last year. The total value of Kansas agricultural and live stock products in 1897 is placed at $230,000,000.

Sheffield, Conn.

WANTED.

Man with a little money to take charge of established Heating and Plumbing Shop. Good man wanted more than money. "JONES"
P. O. Box, 1086,
Philadelphia.

FOR SALE.

A good clean, well assorted stock of Hardware, with Plumbing and Tin Shop connected and commanding the best trade in town. Competition consists of one other hardware store. Located in Central New York State in a town of about 7500 inhabitants, having the trunk lines of railroad, paved streets, electric lights, electric street cars, water works, good schools, etc. Stock and fixtures will invoice between $7000 and $8000. Annual sales average about $25,000. This is a rare chance for a cash buyer. Address "RARE CHANCE," office of *The Metal Worker*, 232-238 William St., N. Y.

Special Notices.

A Rare Opportunity.

On account of failing health the owner offers for sale outright a Stove Manufacturing business of more than 30 years' standing, commanding a trade among the very best dealers in Ohio and Indiana. This offer covers a full line of Wood Cooks and Ranges, Coal Cooks and Ranges, also Wood and Coal Heaters. No manufactured stock or real estate is offered. All patterns, follow boards and flasks are in first-class condition and good live working order. Most of best selling patterns have only been in use about three years. Patterns are in active use and on the market and a purchase would include good will of the business. Will sell outright at **very great sacrifice**, or with proper parties would be willing to retai an interest in the business if desired. For further information address

"STOVES,"
office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, O.

FOR SALE—CHEAP.

F. C. RANTZ, Le Roy, Genesee Co., N. Y.

Stove and Steel Range Manufactory

Located at MUNCIE, IND.,

To be Sold at Public Sale.

The stockholders of the JOSEPH BELL STOVE & RANGE COMPANY have passed an order to sell their plant and equipment and stocks of material and manufactured stock at public sale, on Wednesday, the 5th of January, 1898, on the grounds of the company at MUNCIE, IND.

The property consists of over 6 acres of ground conveniently situated at MUNCIE, IND., on the West Bank of White River, on the line of the Lake Erie & Western Railroad and accessible to the Big Four Road. The buildings thereon are nearly new and of substantial construction. The Molding building, of brick, is 135 by 145 feet There are two cupolas. The Mounting and Storage building, also of brick, is two stories high, 260 by 60 feet. Office building and show room of frame, two stories. All of the best construction and conveniently arranged.

There is a complete Nickel Plating plant. There are tools and appliances for the economical turning out of the best class of work.

There is a large line of patterns which includes cooking and heating stoves and a line of popular Steel Ranges.

A gas well on the premises belonging to the company furnishes an abundant supply of natural gas. These works have been in operation until recently and are in order to resume work at any time.

The entire property, including all stock on hand at day of sale, materials, patterns, tools and equipment and good will, will be sold in one lot. Sale to take place on the grounds of the company, at MUNCIE, IND., on Wednesday, the 5th January, 1898.

The terms will be made accommodating. Persons desiring information will please address the undersigned.

Now Ready.

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Sent, post-paid, upon receipt of price, by

Messrs. GUMMEY, McFARLAND & CO., Philadelphia.

Gentlemen:—I gladly add my testimonial in regard to Gummey's Anti-Pinhole. I have used it for seven years, and can truthfully say that it is all you have ever represented it to be; it can't be beat, and is the only real charcoal tin plate that I can buy. You have shown great interest in the trade by giving us an opportunity to buy a good old-fashioned charcoal plate, and I wish you much success with it.

C. F. FELDHACKER.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

BICYCLE REPAIRING

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, **$1.00.**

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII.—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

BRIDGEPORT, CONN

—"The Cleveland Leader" tells a story of a simple-minded countryman who strayed into a Cleveland art store the other day, and appeared to be much struck by a picture entitled "Lion, After Gérôme." "Well," said the proprietor after a while, "you seem to be pleased with that picture."

"Yes," the old gentleman replied, "I do sort of like it. That's a powerful ugly lookin' beast thar, and I swon I don't know's I blame Gérôme very much for gittin' out of the way."

"Getting out of the way?" repeated the proprietor. "What do you mean by that?"

"Why," the visitor explained, "it says 'Lion after Gérôme,' don't it? Well, Gérôme ain't nowhar' to be seen, so I s'pose he must be hidin' behind one o' them stuns."

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

—FROM THE CONTEXT.—One morning lately the Representative came to his office with a sniffling cold in his head, and the first letter he dictated was to his wife at home—a delight, by the way, he indulged in every day, whatever may be said of Congressmen in general—in which he told her that owing to the fact that he had slept the night before in a draught and the wind had blown through his pajamas, he had caught a pretty severe cold. The word "pajamas" was a new one for the typewriter, and he balked at it.

"How do you spell that word, sir?" he inquired.

"P-a-j-a-m-a-s," spelled the Representative slowly, and added: "Didn't you ever have to write it before?"

"No, sir."

"In that case, I'll bet you a dollar you don't know what it means."

"I don't bet, sir," he hesitated, "but I guess I know what it means."

"Well, what is it?"

"It's French for whiskers," and the Representative, in the kindness of his heart, smiled sweetly and told the young man he had guessed it the very first time.—*Washington Star.*

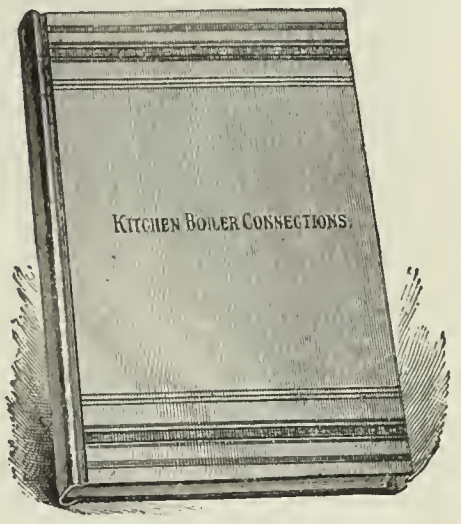
KITCHEN BOILER CONNECTIONS.



A SELECTION OF
Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

KEEP YOUR HANDS CLEAN.

THE PARKS STOVE POLISHING MITTEN AND DAUBER

Is a great improvement over the old stove brush for blacking stoves, **without getting a speck of blacking on hands.**

The front is soft, durable sheepskin, with the wool on. The back is waterproof cloth.

The Dauber is also made of sheepskin, with the wool on, and so shaped as to readily get the blacking into all crevices and corners. It is also adapted to polish russet and patent leather shoes, cleaning windows, furniture, etc.

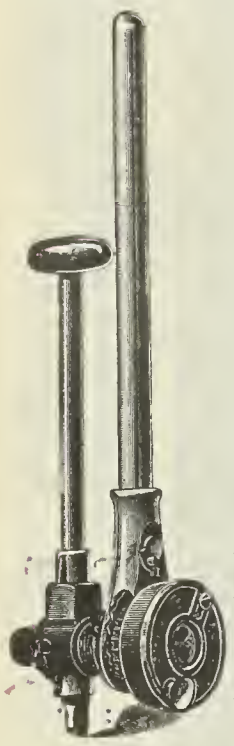
NEW HAVEN, CONN.,

NEW YORK. BOSTON.

The Climax Ratchet Stock.



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

DOUBLE COATED and ABSOLUTELY PURE.

Contains no ARSENIC, ANTIMONY, LEAD or other poisonous ingredients.

Others may claim purity, we alone substantiate it by chemist's certificate attached to each article.

"We have made a critical examination of the products of nearly a score of the manufacturers of such goods, and the only articles of the kind found to be absolutely free from all the dangerous contaminations of which mention has been made are those known as 'Agate Nickel-Steel Ware.' The makers of this ware possess an exclusive patented process by which, through the intervention of a coating of nickel, the impervious or enamel coating is caused to adhere to the steel, thereby doing away with the necessity of a lead bath or the employment of antimonial or arsenical preparations to achieve such results."—C. H. Brace, M. D., in *American Journal of Health.*

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given, 75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex.

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

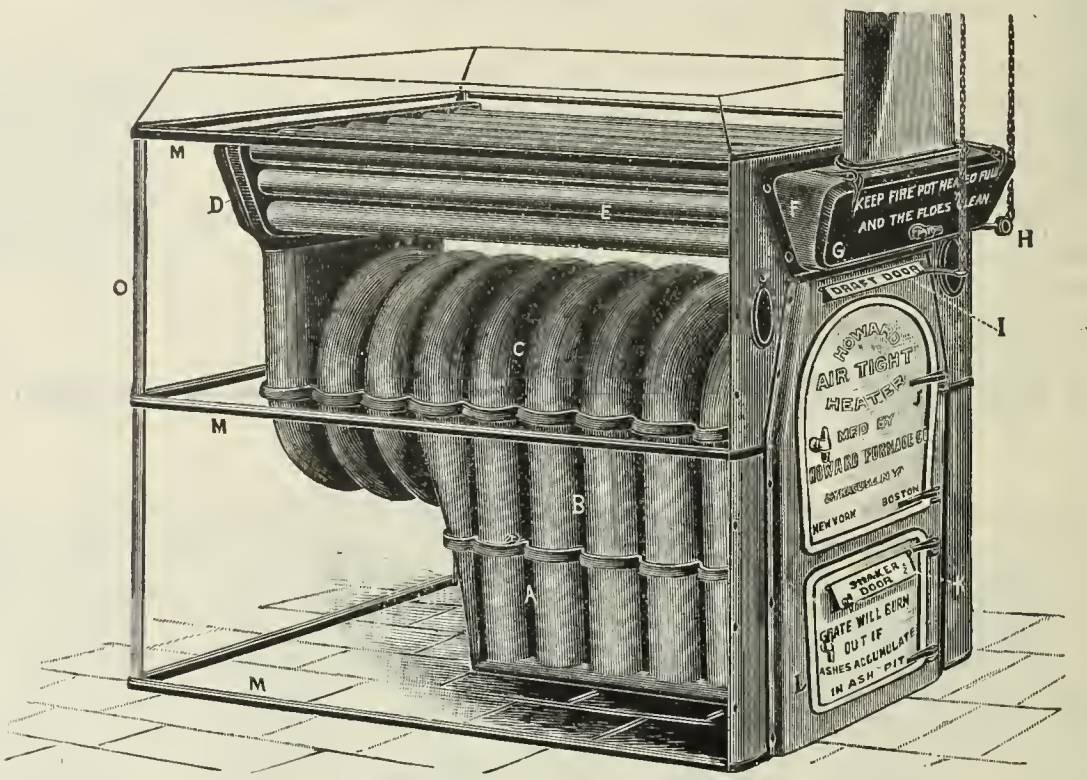
for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

Sent, Express or Postage paid, on receipt of price, FIVE DOLLARS, by

DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., New York.

high domed furnaces

are not conducive to the perfect burning of fuel. They may be regarded as of obsolete construction when the science of combustion is to be treated with any degree of certainty. They allow the unburned particles of carbonaceous matter to pass up and away from the fire to a point beyond where the temperature is insufficient to induce a chemical change between the combustible and the supporter of combustion. That means a waste of heat. It also means a waste of iron. It's paying for something not needed.



Patented July 13th, 1897.

we make

furnaces to heat. We can give any dealer a varied line of heaters to suit the taste of the most fastidious customers. Our best furnaces have low combustion chambers. They are made that way for a dozen good reasons. Perfect combustion due to the close confinement of the gases to the fire is one of them. If you are further interested let us know.

THE MAKERS,

The Business Situation.

A diminishing volume of trade is among the normal characteristics of the closing weeks of the year. This is a waiting season in many industries, and among merchants a time of preparation for the balancing of books in anticipation of the annual inventory. These influences, while clearly reflected at the present time, do not seem to be so pronounced in their effects on the general business of the country as is usually the case so late in the year. Trade reports from all quarters indicate a comparatively active movement of merchandise to be still going on, and the retail trade, especially in winter and holiday goods, is probably larger than it has been at this season for many years past. This activity was reflected in last week's record of bank clearings, which reached the remarkably large total of $1,325,000,000, 16 per cent. more than the total of the previous week (in which there was a holiday), and 15 per cent. more than in the same week of 1896, equal to or larger than in any other week of the past two months. Prices in general are firm, with no noteworthy declines or advances in any line. The principal event of the week bearing on the financial situation was the meeting of Congress on Monday and the issuance of the Presidential message. The effect of the message upon Wall street had been largely discounted by the forecasts which were published, consequently it produced no sensational results in the speculative markets. At the same time it exerted a favorable influence in strengthening values and stimulating business in the Stock Exchange. In the opinion of the most thoughtful and influential men in the street the message is regarded as a conservative and judicious document, calculated to advance the best interests of the country, and consequently favorable to financial and commercial prosperity. The fact of Congress being in session is always, to some extent, an unsettling factor in the business situation. But it is not generally believed that any radical measures are likely to get through the present Congress, and the course of American securities is expected to be toward improvement in market values rather than in the reverse direction. Money is still very easy, and loaning rates have been somewhat reduced. Wheat prices advanced two and one-half cents a bushel within the past few days, on the strength of heavy exports and diminishing receipts, while corn and cotton are firmer and fractionally higher. Collections are generally reported as satisfactory.

The Generosity of Millionaires.

It is a too common fashion in these days to denounce the accumulation of great wealth. Millionaires are sometimes spoken of as if they composed a kind of criminal class. Their riches are held forth—in most cases without a shadow of justice—as circumstantial evidence of their knavery. The mere fact of a man being the possessor of a large fortune stamps him in the minds of some unthinking and prejudiced individuals as a public enemy whose interests are diametrically opposed to those of the people at large. No matter how honestly and with what patient toil he may have amassed his wealth, there is a lurking feeling that he has selfishly grasped a much larger share of this world's goods than should rightfully belong to any one man. No doubt there are too many cases in which large wealth has been accumulated by means which, to say the least of them, do not measure up to the standard of the Golden Rule. There are, and have been, millionaires who fully deserved the popular disesteem in which they are held. Some who have made their money honorably have hoarded it selfishly and transmitted it for the aggrandizement of their families, applying none of it to the public welfare. But we venture to say that these unworthy specimens are the exception and not the rule among American men of wealth. In no other country in the world does the sense of stewardship appear so pronounced among the wealthy as in this. Colleges, educational institutions, libraries, observatories, hospitals, museums, art galleries, churches, charitable institutions of all kinds, by the hundred and the thousand, all over the land, stand as mute but eloquent witnesses to the generosity and public spirit of the men of wealth who have founded, endowed or munificently assisted them. Science, art and learning have been fostered and promoted by the much maligned millionaires to an extent utterly unthought of in former generations. Every year sees public gifts for philanthropic and educational purposes poured out on a scale of increasing liberality, showing that the possession of riches does not necessarily or even generally deaden the moral sense or the finer feelings of their possessors.

The Renewed Demand for Iron.

The fight for iron is not ended. A gallant struggle is being maintained by men who insist that steel is not nearly so well suited to their purposes as iron. Readers of our market reports have not failed to observe that for some weeks the demand for bar iron in the West has been running much above that for bar steel. This may be attributed partly to the lower price now being made on bar iron in that section. But it must be admitted that among certain classes of consumers a strong preference still exists for iron. Some

important manufacturers of farm machinery are finding that the change made from iron to steel in their machines in the past two or three years is bearing troublesome fruit. Their customers complain that repairs are not so easily made as when iron was used. The ordinary blacksmith finds it sometimes difficult to make a weld or to cut a thread or to tap for a bolt, and tells his farmer friend that steel is not suited for such purposes. Another call for iron has therefore been recently going out from this class of trade, much to the gratification of those who are better prepared for making it than finished steel.

But it is not in bar iron alone that a lingering demand is seen for the more tractable metal. Curious instances are cropping out of preferences for iron in other branches. Recently an order was entered for iron sheets for roofing, which the buyer said he proposed to run through corrugating rolls himself, so as to be absolutely certain that he was not having steel substituted in the painting room. His claim was that a steel sheet rusted so much more rapidly than an iron sheet that he could not afford to put on a steel roof, as it would need repairing too quickly. Enginecrs on some important railroad systems are found adhering rigidly to iron in their bridge specifications, notwithstanding the general use of steel in all kinds of structures, because they deem it the more reliable metal. They fear the effect of cracks from punching or internal strains from rolling, and refuse to be guided by the practice of their professional brethren who lay down rigid specifications for the steel maker and have sufficient confidence in their own formulæ to use the product thus turned out. Then there are nail consumers who look back regretfully to the days when iron cut nails were the only nails to be had. They claim that rust did not so quickly affect them as it does the modern steel nail. Instances in other lines might be adduced to show how much finished iron is still sought after by those who claim practical knowledge of its merits. This preference goes so far, in fact, that some iron workers will not be satisfied with anything but Swedish charcoal iron, especially when making difficult or intricate forgings.

While it would be absurd to argue from these facts that the great change to steel has been seriously checked, hope for the future is nevertheless held out to those who have continued to manufacture finished iron. A market still exists for a reasonable iron output and will continue to exist unless the difference in price is so great that it eclipses all other considerations. Consumers are discriminating, and names no longer cut an important figure with them. At one time the word "steel" was a name to conjure with, and the manufacturer who made a steel mower or reaper or cultivator or other steel article carried the day against a competitor who had not come to the point of discarding plebeian iron. But now the steel used must in all respects be suited to its purpose or it is not considered as good as iron.—*The Iron Age.*

The Trans-Mississippi Exposition.

Active steps are being taken to secure an important display of exhibits for the Trans-Mississippi and International Exposition, which will be opened at Omaha, Neb., in June, 1898. The United States Government is pledged to take part in the enterprise by the erection of suitable buildings and an exhibit. For this purpose $200,000 has been appropriated. By direction of President McKinley, the Secretary of State has extended official invitations to foreign nations to take part in the exposition. The Government exhibit will be one of the most comprehensive ever made, as it will comprise those given at the great fairs held at Chicago, San Francisco, Atlanta and Nashville. All the Trans-Mississippi States are to make exhibits, and a number of South and Central American countries, including Chili, Peru, Brazil, the Argentine Republic, and also Mexico, have signified their intention to take part in the exposition. The exposition has $2,000,000 capital to start, and 300 acres are now being laid out for exposition grounds. Offices are about to be opened in New York City for the purpose of securing exhibits from the Eastern cities, under the charge of Clinton Felder of the Department of Exhibits. A number of large concerns in New York have already engaged space, and Mr. Felder expects to secure a very satisfactory representation of Eastern manufactures. The New York City offices will be kept open for five months.

A Factor in Success.

A correspondent who recognizes the value of modern methods of bookkeeping and the advantages of an accurate knowledge of costs sends to us the following interesting and suggestive communication:

An up-to-date bookkeeping system, which will show each month the progress of the business and will provide the cost of each article made, is an essential part of the plant of the modern manufacturer. The firm or company who are satisfied, the year through, with the bookkeeper's assurance that the "ledger is in balance," and are content to wait until some weeks after the annual inventory has been taken for the first intimation of how the business has been going on for a year, are not in the lead to day. Manufacturing businesses are so dissimilar, and the requirements of each are so varied, that a formula adaptable to all alike is unattainable. Each business must be studied by the accountant, its individual needs catered to, suitable books of account and record inaugurated, and simple forms of daily, weekly or monthly reports to the head of the house designed. The saving in time and labor during the first year, resulting from the adoption of such methods, will more than cover the cost of new books and accountant's services, while the benefit of the improved facilities will be felt from the start.

The Paris Exposition.

The report of Major Moses P. Handy, special commissioner to the Paris International Exposition of 1900, was submitted to Congress by the President on Tuesday. In his letter transmtiting the report the President made the following observations:

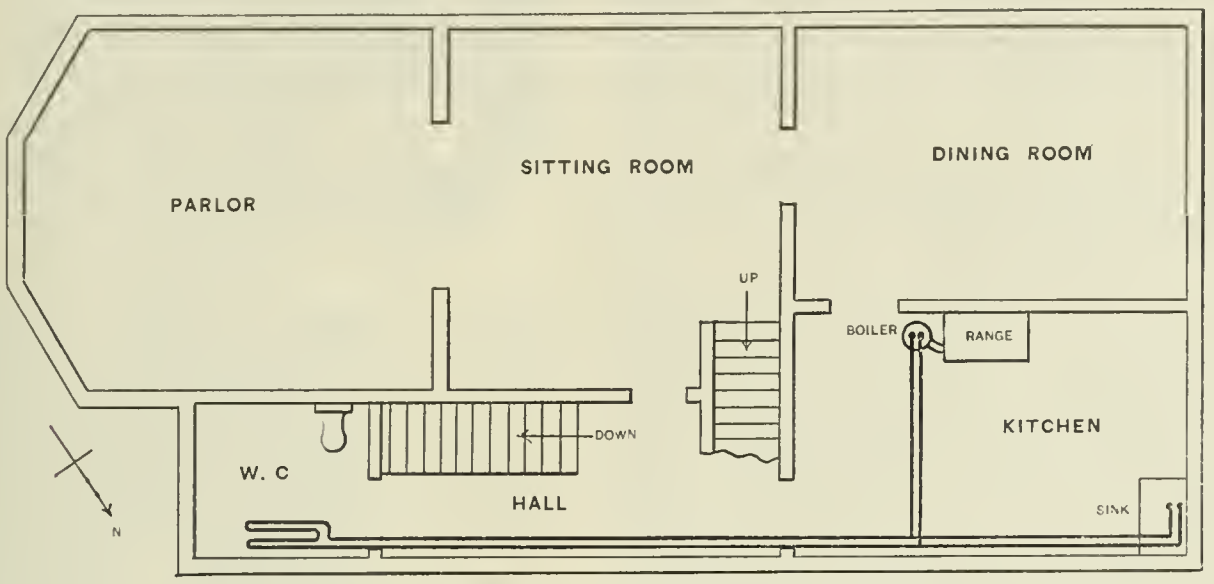
Besides securing a much larger amount of space than had been reserved, Major Handy obtained the gratifying assurance that the United States will be placed on a footing with the most favored nations, and that in the installation of every important department the United States will have a location commensurate with the dignity and importance of the country, and adjoining in every case countries of the first rank. In view of the magnitude and importance of the approaching exposition, and of our standing among the nations that will there be represented, and in view also of our increased population and acknowledged progress in arts, science and manufactures, I earnestly commend the report of Major Handy to your consideration, and trust that a liberal appropriation may be made.

Commissioner Handy embodies in his report a recommendation that an appropriation of $919,600 be granted by Congress, so that a creditable display may be made on the part of the United States. He believes that this country will secure about 200,000 square feet of space. Already, two years in advance of the exposition, he has received applications by intending exhibitors for 132,969 feet, or more space than was ever occupied by the United States in any foreign exhibition. The commissioner strongly recommends that every proposed exhibit be submitted to a critical inspection by the United States Commissioners in order to keep out the commonplace, in view of the great preparations that are being made by European nations to excel in the quality rather than in the quantity of their exhibits.

THE LETTER BOX.

Heating from Range Boiler.

From C. S. M., Utica, N. Y.—I wonld like to have a little assistance from *The Metal Worker* on a heating job which I have in hand. Fig. 1 presents a plan view of the second floor, showing the location of the range, the boiler and a room at the front of the building in which a water closet is placed, which we wish to keep from freezing. This room contains about 425 cubic feet of space and is over the first-floor hall. The building is of frame construction. Fig. 2 is an elevation showing how we propose to rnn the piping and locate the radiator. We would like to know if this plan of piping is correct and what size of pipe and radiator should be used to secure satisfactory results. A hall leads into the closet room, which must also be taken into account in the heating.



Heating from Range Boiler.—Fig. 1.—Plan, Showing Work to be Done.

Answer.—The success in heating, if the job is properly piped, depends on the ability of the water back in the range to heat the extra amount of water that will be required for warming the room in qnestion. If the fire is not rnn continuously there may be some difficulty in heating a 30-gallon boiler and the radiator in addition. From the sketches furnished we assume that the radiator is to be located in the form of a heating coil on the ceiling of the room to be heated. Better service would be secured if the heating coil could be located on the side wall near the floor on the outer wall of the building. For the space to be heated a radiator presenting 15 square feet of surface would be sufficient. To secure proper circulation the connection at the top of the boiler should be taken out and a 1-inch pipe run direct to the radiator, a tee being placed at the top of the vertical pipe immediately above the boiler, to which the service pipe to the sink should be connected. The return from the radiator should be 1 inch in size all the way to the water back, and the pipe bringing the cold water from boiler to the water back should connect into this 1-inch pipe. If this return pipe from the radiator can be run along the floor so that it will not be in the way until it reaches the kitchen it might drop down and run nnderneath the floor to a point just beneath the water back, when it could rise through the floor and be connected. The plan presented will probably prevent the closet from freezing, but more effective heating would be secured by placing the heating coil as we have suggested.

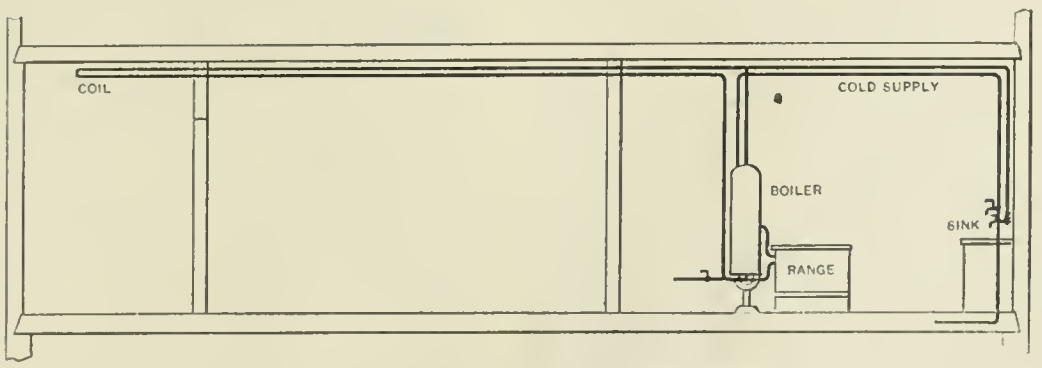


Fig. 2.—Elevation, Showing Proposed System.

Trouble With Solder in a Copper Tank.

From W. C. B., Ridgewood, N. J.—The inquiry of "F. F. H.," Woodbury, Conn., in *The Metal Worker* of November 27 in regard to the trouble with solder, touches a subject in which we are very much interested. In Ridgewood, N. J., where there is no public water supply, the water is obtained in most cases from bored wells which are drilled from 100 to 300 feet deep. The water thus obtained is what is usually termed "hard," and contains a great amount of magnesia, lime and other substances, which either eat or decompose the solder used, or else it is the mineral quality of the water that creates a galvanic action when the solder is used on copper, and which gradually destroys the solder. Apparently it has

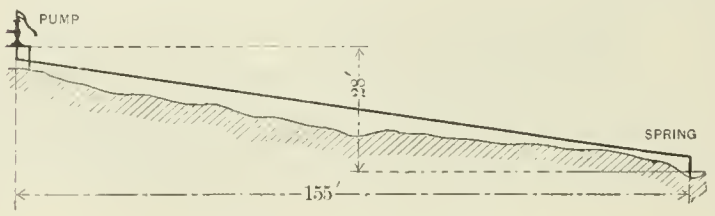
the same effect as the action of sal ammoniac on zinc in the ordinary wet batteries. We have had to resolder at least a dozen tanks in which the solder was entirely eaten out. The lines of the soldered seams show a white chalky substance on the surface and black underneath, which resembles carbon, and when rubbed or scraped turns the water like ink. The copper and solder dealers have been consulted, and they do not know the cause, nor have they been able to suggest a remedy. We have experimented a little and found that paraffine and beeswax, or the proper proportions of wax and resin, will, in some cases, prevent the water from reaching the solder, and thus preserve it. We would also like to hear from other plumbers who have had the same trouble to contend with, and hope that some solder dealers or chemists who are interested in this work will come to Ridgewood and examine a few hundred tanks which I know would furnish an interesting field for experiment.

From J. B., Fort Wayne, Ind.—In answer to the inquiry of "F. F. H.," in *The Metal Worker* of November 27, I would say that I think he ought to do the repairs to the tanks he mentions at his own expense, for having soldered them with half-and-half solder and having used acid for a flux on copper. The fact is that half-and-half solder is anything that the manufacturers may put into it, and worse yet if old metals are used. There is no one who uses that grade of solder because it is good, but because it is cheaper in price.

Note.—The best advice when it comes to a person in trouble always seems more or less severe, and the comment of this correspondent points to a method that would probably avoid trouble. On the other hand, many workmen who use solder have not become acquainted with the various qualities of solder which bear the same name, and assume that what they buy is exactly what it is marked, and under some conditions the materials used bring trouble. Every good tinner knows that when the surface of the copper is thoroughly cleaned it is not necessary to use acid as a flux. He also knows that the purer the metals are of which the solder is composed and the larger the proportion of tin the better its lasting qualities.

Changing Pump Arrangement.

From L. A. S., Warren, R. I.—Please inform me what sized pipes you would use and how many valves, and where you would place them, to bring water easily



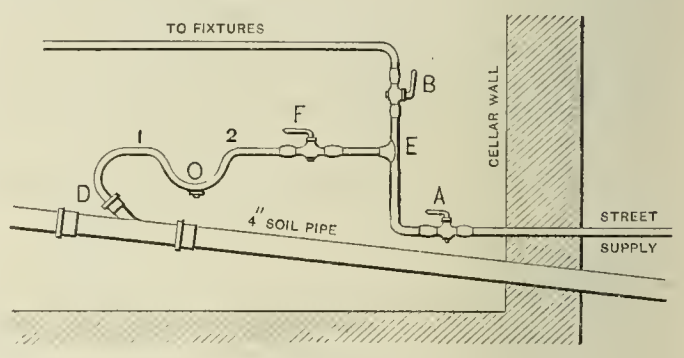
Changing Pump Arrangement.

from the spring, according to the arrangement shown in the accompanying diagram. The hight of the pump is about 28 feet above the spring, and the length of the piping 155 feet, the pump being a No. 3 Douglass force pump.

Answer.—The hight of the pump, as stated, is very near the limit of reliability, and we advise the use of the style of pump with the valve chamber set 5 or 6 feet below the pump base. This can be readily done by sinking a pit and bringing the suction in at as great a distance below the pump as can be done. This will give, if 6 feet depth can be made, a lift of only 22 feet, which will give the pump a good working capacity for the long suction pipe. Use 1½-inch pipe for the suction, with a foot valve and strainer at the spring. Put a rising pipe in the pit, connected to the suction close to the pump chamber, and extending up to a convenient place for charging the suction pipe with water to start with, and close the top air tight with a cap. This answers the double purpose of an air chamber and charging pipe. See a similar arrangement illustrated and described in *The Metal Worker* October 16.

Is It Dangerous?

From O. & P., New York.—We submit herewith a drawing of a portion of a system of plumbing. The specifications call for this system to be emptied through the main supply at or near the entrance of the same in the cellar. Would it be proper to make the connection as shown in the cut, putting a stop cock at A, B and F, and at E connecting a branch with the soil pipe at D, using a common running trap O? Should this trap be vented, and if so, where—at 1 or at 2? The main supply pipe is ¾-inch pipe. The pipe from E to D is also ¾-inch lead pipe, with a trap made as shown. To let the water off the system it is designed that the cock A shall be closed



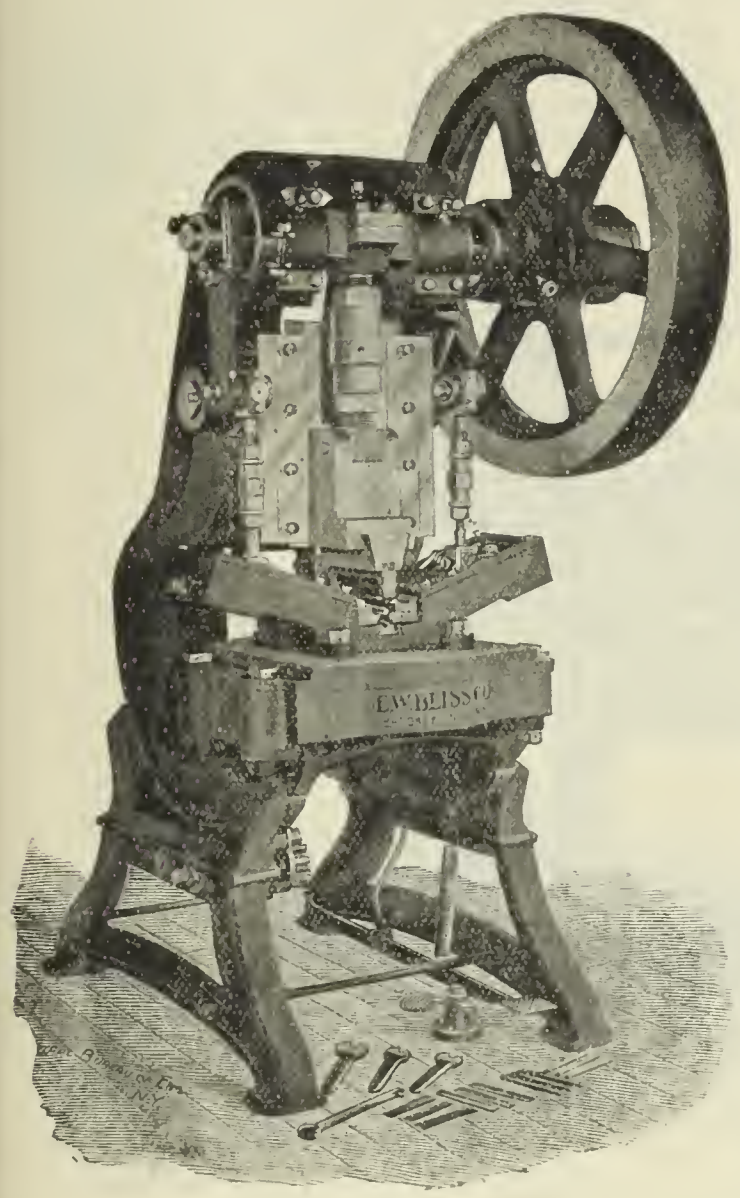
Is It Dangerous?

and the cock F opened. If the drain needs flushing, by closing the cock B and opening F and A the water will rush in and flush the drain. Kindly explain the purpose of a vent to a trap; is it to allow a column of air to enter, as at 1 in the sketch, to break the column of water in the trap and prevent siphoning out? If the vent is to be connected at 2 explain why it would vent any more than the waste pipe to a fixture?

Note.—This raises a question that can be discussed to advantage to the trade, and we hope that those who have had experience with similar connections and observed the results will present their views. It is considered by some that it would be safer to avoid such a connection. The possibilities of danger to the health of the occupants of the building arise when the water has been drained out of the service pipes and the pipes left empty for a time when there would be no hindrance to the entrance of sewer air to the house, unless the trap seal had not become broken by evaporation, or that the stop cock at F had been closed after the system was drained. With the stop cock F closed there is no possibility of sewer gas entering the water service of a building. When the building is occupied and the system in use under ordinary circumstances there would be no objection to the connection. When it is desired to flush the house soil pipe, the pressure of the water in the service pipe would be sufficient to prevent any possibility of sewer gas coming into the building. The rush of the water through the pipe E D would be sufficient to drive the sewer air or other matter in the opposite direction. The case in question is similar to what is common practice in New York City, where instead of putting an ordinary bib under the boiler for a sediment or draw off cock, the stop cock is placed in a pipe which runs over to the waste from the kitchen sink and is discharged into it, so that in case it is desirable to cleanse the boiler of sediment it can be readily done. This cock also serves as a means of withdrawing water from the entire plumbing system, when the building is to be unoccupied during the winter season. It must be borne in mind, however, that under exceptional circumstances there might be danger of the contents of the drain entering the water supply pipe. For example, assuming the drain to be partly choked between D and the sewer, and the cock A to be closed and the water drawn off by opening F, then if a closet was flushed on an upper floor by the water remaining in the tank, the discharge might back up into the water service pipe through D.

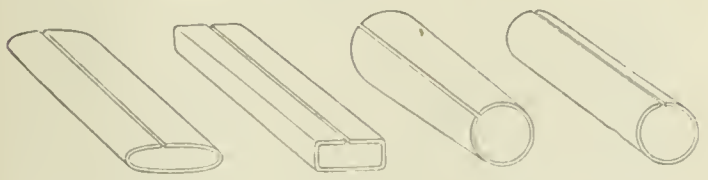
The Bliss Tube Forming Press.

The press shown in the accompanying cut illustrates a machine that will form tubes up to 10 inches in length at one blow, either straight, taper, round, oval or square, as shown in the line drawings, ¼ to 1 inch in diameter, according to the dies used in it. The operator can form 20 tubes or more per minute. The toggle slides, which operate from the right and left, are cam actuated and easily adjusted for different shapes. The mandrel over which the tubes are formed first descends upon the blank, bending it into U shape and carrying it against the lower die, whereupon the forming tools attached to the lateral slides complete the operation. The tube is carried up with the



THE BLISS TUBE FORMING PRESS

mandrel after the side tools have retired and is easily removed by the operator. In the case of tubes which have to be more than ordinarily exact a second blow is usually



Specimens of Work Done on Bliss Forming Press.

given immediately after the first without stopping the press. This causes a forming blow to be delivered by the punch upon the top of the tube while held by the mandrel in the die. This machine is adapted for the manufacture of bicycle parts, hubs, pedal centers, &c., spouts, penholders, small can bodies, either round or square, &c. The weight of the press, which is built by the E. W. Bliss Company, 16 Adams street, Brooklyn, N. Y., is 3500 pounds. The company also build a heavier press for tubes 13 inches long.

Catalogues have been issued for the 1897-1898 term by the Thomas S. Clarkson Memorial School of Technology, at Potsdam, N. Y. There is one course in mechanical and electrical engineering and another in the mechanical arts, domestic science and normal manual training. Barton Cruickshank is director. The winter term begins on January 4.

The Panama Canal.

United States Consul General Gudger, at Panama, has made a report to the State Department on the condition of the Panama Canal, of which the following is the gist: The canal when completed will extend from Colon on the Atlantic to Panama on the Pacific, 54 miles. All along the route are sheds full of new and costly machinery. It was estimated the latter has cost $100,000,000, and that there has been expended on the canal a total of $275,000,000. A conservative estimate is that the canal is about one-third finished, but with the new machinery on hand it is said the remainder of the work can be completed for $150,000,000. The report is that a force adequate to finish the project in from seven to ten years will be put to work. During the next 60 days a committee is to investigate the progress of affairs, and an effort will be made to get more money to continue operations. The canal is practically completed from Colon to Bajeo, 14 miles, but this is the least expensive part. The great difficulty is in passing the Calebria Ridge. The width of the canal will be 160 feet at the top and 72 feet at the bottom, except through the ridge, where it will be 78 feet wide at the top and 29 feet at the bottom.

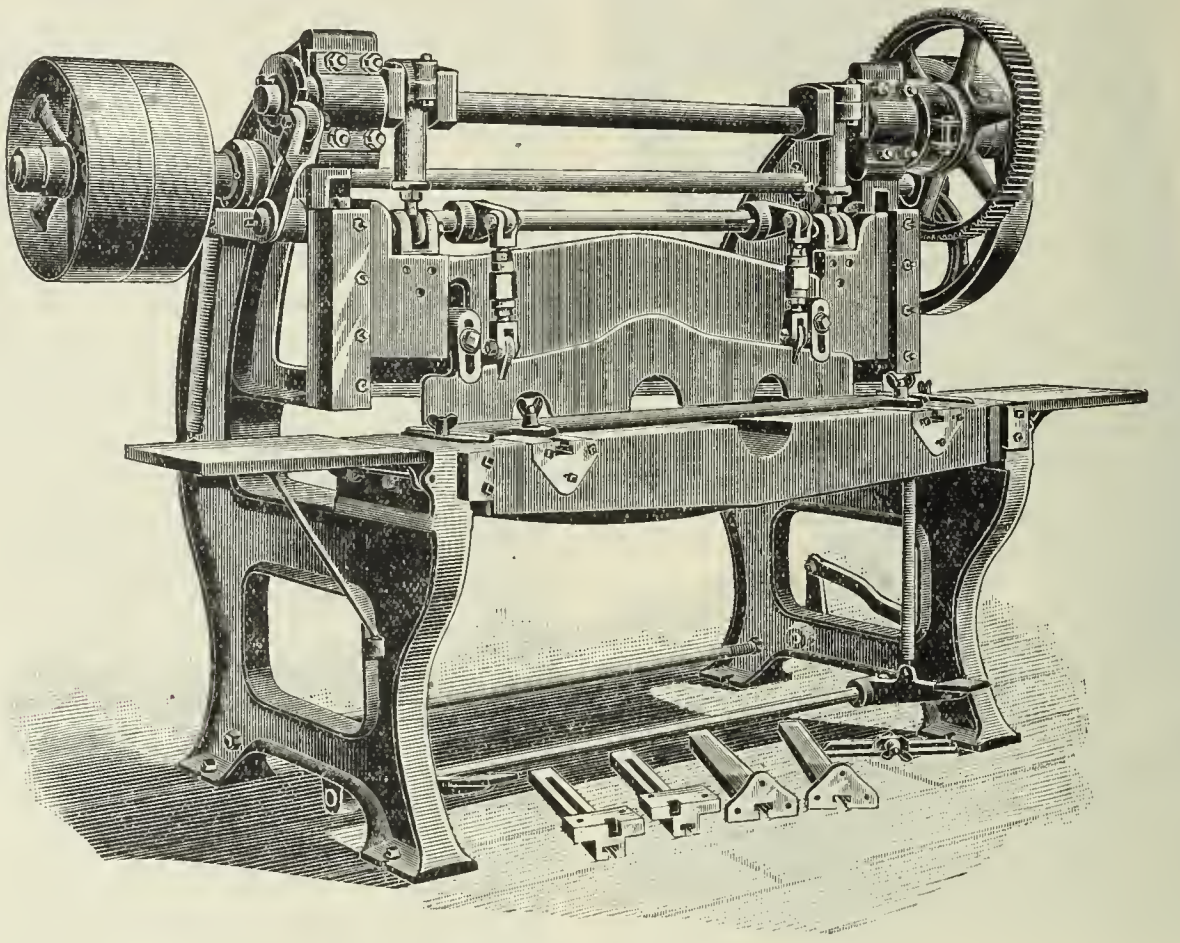
The Otto-Hoffmann Coke Ovens at Boston.—We have been furnished with some interesting facts regarding the new by-product coke plant to be erected near Boston. The works will be located at Everett, 2½ miles from Boston, adjacent to the Boston & Maine and Boston & Albany Railroads. The plant will be built by the New England Coke & Gas Company, which concern have acquired all the rights and privileges granted by the State to the Massachusetts Pipe Line Company and have also absorbed the latter concern. A site containing 250 acres of land has been secured with harbor frontage on Mystic River and Island End River. The works are planned for 1200 ovens, or three blocks of 400 each. Four hundred of these ovens are now under construction and work is being pushed as rapidly as possible. When these have been finished another block will be commenced. The Dominion Coal Company will furnish the coal from their Nova Scotia mines. The coal will be washed at the mines and will be shipped to Everett by steamer. The shipping facilities will enable the company to ship coke by lighters around the harbor and also by rail. The works will include an ammonia factory, a benzole factory, a purifying house and 10,000,000 feet of gas holder capacity. The general plan of the works is practically the plant at Glassport, Pa., but, of course, on a much larger scale. A full description of this plant appeared in *The Iron Age* of November 11. It will require fully a year before the 400 ovens now under way will be completed. The coke output from these 400 ovens will be 500,000 tons a year. The gas output will be 6,000,000 feet per day. The principal consumers of the coke will be the railroads, and a large crushing plant will be included in the equipment and will be used to crush part of the output to the proper size for domestic use. Most of the gas will be sold to the citizens of Boston for heating their houses. The balance of the gas output will be purified and sold for lighting purposes. It is the intention to furnish the gas for fuel purposes at practically the same prices charged for natural gas in Pittsburgh. The gas for light will also be furnished at a low price.—*The Iron Age.*

Exhibition in the Chicago Coliseum.—Some local capitalists about six months ago conceived the idea of having a manufacturers' carnival and winter fair under one roof, at Chicago. To this end the Coliseum was engaged for five months, and the manufacturers' carnival and winter fair will open in that building December 18, and will close May 15, 1898. Local interests, both commercial and manufacturing, will be represented by some of the largest firms, while Ohio, Indiana, Michigan, Wisconsin, Tennessee and Illinois will furnish their quota of manufactured products. There will also be the famous features of the Midway—Irish Village, Streets of Cairo, Chinese Theatre and others of the old favorites.

Wilkins and Davidson, mechanical engineers of Pittsburgh, have been appointed consulting engineers for the construction of the new sheet mill plant to be built at Scottdale, Pa., on the co-operative plan. It is stated that it will be a six-mill plant with all modern appliances. Many of the stockholders in the new enterprise were formerly employed by the Scottdale Iron & Steel Company, Limited, but went out on a strike and lost their positions.

The Niagara Power Gap Shears.

The Niagara Stamping & Tool Company of Buffalo, N. Y., are building a line of power gap shears suitable for cutting soft steel up to ⅛ inch thick. The housings have a gap or open throat 15 inches deep, which permits of trimming sheets of any length and cutting them apart up to 15 inches from the edge. The driving mechanism is put overhead instead of underneath the bed as formerly. This construction possesses the advantage that the belt will not close up the gap, particles of grit and scale, that may come off from the material while being cut, cannot drop into the working parts and the gap arms that were a necessity in the former construction have been done away with. The cross head carrying the upper knife is operated by means of a double crank shaft made of forged steel. In front of the cross head there is an automatic hold down attachment driven by means of cams and levers from the main shaft. This hold down attachment travels ahead of the cross head and holds the sheet firmly upon the bed while being cut. The motion is controlled by the Niagara clutch, which is positive and of simple construction. The illustration shows a machine that will cut and square 52 inches. Other sizes are made up to 10 feet long.



THE NIAGARA POWER GAP SHEARS

Breaking Streets to Make Connections.

The city of West Chester, Pa., has made all preparations to lay some fine streets, and is confronted with the probability that immediately after the work is completed it may have to be torn up to make gas, water and sewer repairs or connections. This has brought out in a local paper the following proposition:

To avoid such an annoying experience coming in to spoil a newly made street some plan ought to be adopted that would prevent the possibility of such an experience. This could be done by constructing an arched tunnel under each street through which the water mains and gas pipes could be safely carried, as they are done in some cities. The expense could be jointly borne by the town, which owns the water system, and the gas company. Possibly the electric light, telephone and telegraph companies might be made to string a large part of their wires through the same underground conduit, and thus allow of the removal of some of the poles which citizens occasionally complain of as disfiguring their properties. If all of these companies made use of the underground passageway they could all contribute to the expense of making it in proper proportions, whenever the Borough Council determined that it was necessary to put one in on any street. Manholes at proper intervals would allow of getting down into the tunnel for repairs and investigations. If such a plan were adopted there could be no further trouble about making a good road bed on top, and everybody would feel that it was permanent. There would be no excuse then for breaking up the surface of the street. It is possible that the cost would, when distributed among all the parties interested, be found to be even less than at present when the borough, the gas company, the telephone, telegraph and electric light companies all proceed in their own way and among them give innumerable inconveniences to the citizens when repairs are being made.

A Pocket Handkerchief Newspaper.

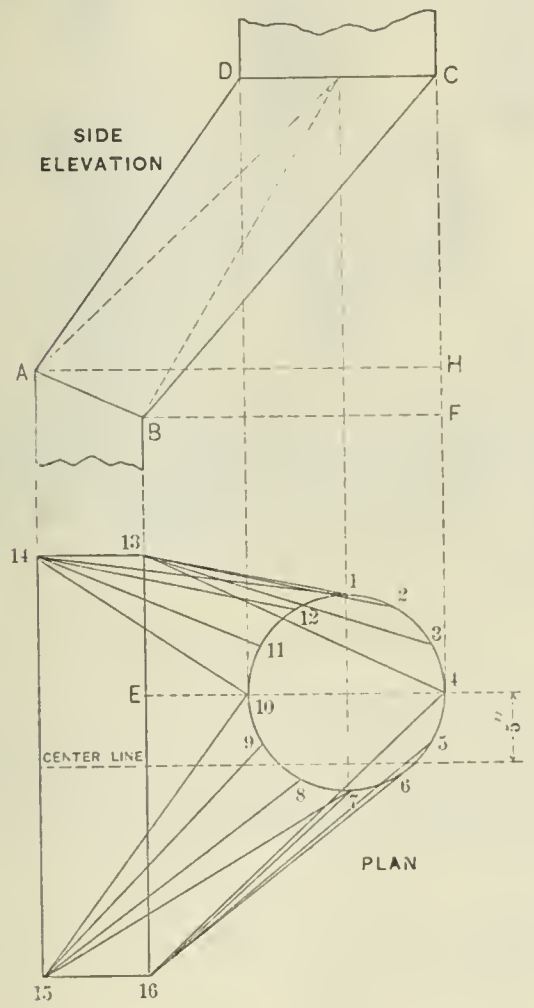
A curious relic of the old days of the paper duties which so much hampered journalistic enterprise in the first half of the present century will shortly come up for sale at a London auction room, says the *Westminster Gazette*. It is the first number of "Berthold's Political Handkerchief," being a news sheet printed on cotton fabric instead of paper, the idea being to evade the paper duty. It is dated London, Saturday, September 3, 1831, price 4 pence, and the letterpress, which is fairly legible, is as remarkable as the material on which it is printed. The tone of this news rag is intensely radical, but it reproduces the order of ceremonial to be observed at the coronation of King William IV and Queen Adelaide on the following Thursday, and it is announced that a proclamation to the people of Europe will appear in our "next cotton." It is embellished with a medallion woodcut of Napoleon crossing the Alps, but the ink in this pictorial effort was too much for the cotton, and the Alps are in a fog and the emperor on horseback very indistinct.

Plans for the establishment of a warehouse in the city of Caracas, Venezuela, by the National Association of Manufacturers of the United States, 1743 North Fourth street, Philadelphia, for the purpose of displaying samples of American manufactured articles and to serve in other ways in establishing more intimate commercial relations between Venezuela and the United States, have progressed to the point where the early opening of the warehouse has been decided upon, and those who have engaged space in the warehouse have been notified to prepare their exhibits for shipment from New York on December 14. The goods will be shipped by the Red D line, and it is expected that nearly all the exhibits thus far arranged will go forward on December 14. Some of the goods have already been shipped.

SHEET METAL WORK.

PATTERN FOR OFFSET RECTANGULAR TO ROUND.

A correspondent, "M. B.," New York City, wishes to learn through *The Metal Worker* the method of obtaining the pattern for an offset with a rectangular base and round top, with center line of round top of the front view to be 5 inches from the center line of the rectangular base, while the end view is the same as shown in *The Metal Worker* of June 5, 1897, page 36, and is reproduced herewith in Fig. 1. Let A B C D be the side elevation of the article, 13 14 15 16 the plan of the rectangular base, and 1 4 7 10 the plan of the round top. The first step is to obtain diagrams of triangles the hypotenuses of which will be used in the development of the pattern, and for



Pattern for Offset Rectangular to Round.—Fig. 1.—*Plan and Elevation.*

which proceed as follows: Divide the plan of the round top into equal spaces, as shown by the small figures from 1 to 12. From the several figures from 1 to 4 draw lines to the corner 13 of the rectangular pipe. In the same manner draw lines from the various figures 4 to 7 to the corner 16, from 7 to 10 to the corner 15, and from the figures 10 to 1 to the corner 14.

Then will these lines represent the bases of the triangles, which will be constructed as follows: It should be understood that the straight hight of that portion shown in plan by 13 16 7 4 1 is shown in elevation by F C, while the straight or vertical hight of 14 15 7 10 1 in plan is shown in elevation by H C.

Draw any vertical line in Fig. 2, as 13 A, equal in hight to C F of Fig. 1. Take the various lengths of lines shown in plan by 13 1, 13 2, &c., and place them on a line drawn at right angles to 13 A, as shown by A 1, A 2, &c., of Fig. 2. Draw lines from the points 1, 2, 3, 4 to 13. Then will these lines represent the hypotenuses of the triangles whose bases are shown by lines of similar number in plan view, Fig. 1. In the same manner construct the diagram of triangles shown in Fig. 3, whose base lines are obtained from 4 7 16 in plan, Fig. 1, and hights from F C in elevation.

Take the hight H C in elevation and place it on the vertical line 15 A of Fig. 4. Then take the various lengths

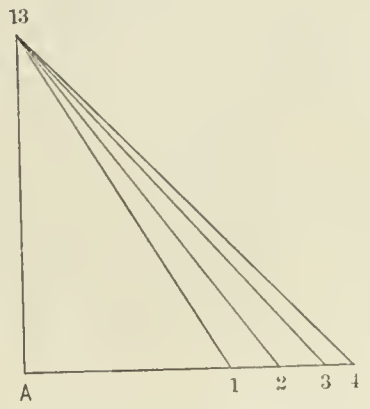


Fig. 2.—*Diagram of Triangles on Solid Lines in* 1 4 13 *of Fig.* 1.

shown in plan in Fig. 1 by 15 10, 15 9, &c., and place them on the line drawn at right angles to 15 A in Fig. 4, as shown by A 10, A 9, &c. From the points 7, 8, 9 and 10 draw lines to 15. These lines will then represent the hypotenuses of the triangles whose bases are shown by lines of similar numbers in plan, Fig. 1. In the same manner construct the diagram of triangles in Fig. 5, whose bases are shown by 14 1, 14 12, 14 11 and 14 10 of Fig. 1, and hights by H C in elevation.

For the pattern proceed as follows: At right angles to 13 16 in plan, Fig. 1, and from the point 4, draw 4 E, as shown. Then will B C in elevation be the true section on the line 4 E in plan. In Fig. 6 draw any vertical line,

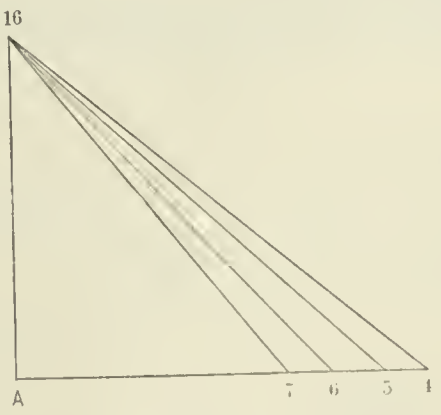

Fig. 3.—*Diagram of Triangles on Solid Lines in* 4 7 16 *of Fig.* 1.

as 4 E, equal in length to B C in elevation, Fig. 1. At right angles to 4 E in Fig. 6, and through the point E, draw the line 13 16, making E 13 and E 16 equal to E 13 and E 16 of Fig. 1. Draw a line, 13 4 and 16 4 in Fig. 6, which should equal in length the distance 13 4 and 16 4 in Figs. 2 and 3, respectively. Now with 13 of Fig. 6 as center, and the various hypotenuses in Fig. 2 as radii, describe arcs as shown by 3, 2 and 1 in Fig. 6. Then set the dividers equal to the divisions on the circle in Fig. 1, and, commencing on the point 4 in Fig. 6, step from one arc to the next until the point 1 is obtained. Draw a line

from 1^1 to 13. Now with B A in side elevation, Fig. 1, as radius, and 13 of Fig. 6 as center, describe the arc 14. Then with 1 14 of Fig. 5 as radius, and 1^1 of Fig. 6 as center, intersect the arc 14, as shown. Now with the various hypotenuses in Fig. 5 as radii, and with 14 of Fig. 6 as center, describe arcs as shown by 12, 10 and 11. Set the dividers equal to the divisions on the circle in Fig.

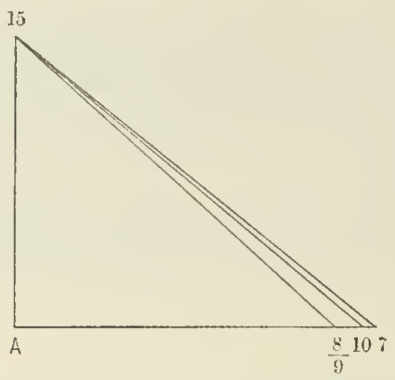

Fig 4.—Diagram of Triangles on Solid Lines in 7 10 15 of Fig. 1.

1, and, commencing at the point 1^1 of Fig. 6, step from one arc to another until the point 10^1 is obtained. Draw a line from 10^1 to 14. Now with 14 15 in plan, Fig. 1, as radius, and 14 of Fig. 6 as center, draw the arc 15^1. Then with 10 15 of Fig. 4 as radius, and 10^1 of Fig. 6 as center,

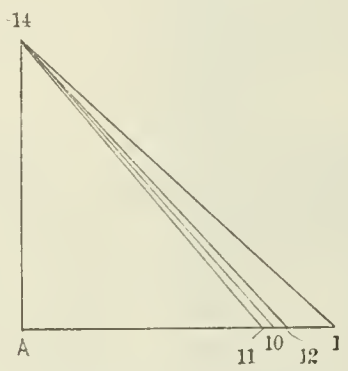

Fig. 5.—Diagram of Triangles on Solid Lines in 1 10 14 of Fig. 1.

intersect the previous arc, 15^1. Draw a line from 10^1 to 15^1 and from 15^1 to 14.

Now with the various hypotenuses in Fig. 3 as radii, and 16 of Fig. 6 as center, describe arcs shown by 5, 6 and 7. Step off the distances from arc to arc, as before explained, until the point 7^1 is obtained. Draw a line from 7^1 to 16. Now with B A in side view, Fig. 1, as radius, and 16 of Fig. 6 as center, describe the arc 15. Then with 7 15, Fig. 4, as radius, and 7^1, Fig. 6, as center, intersect the arc 15. Now with the various hypotenuses in Fig. 4 as radii, and 15 of Fig. 6 as center, describe arcs shown by 10, 9 and 8. Step off from arc to arc, as before explained, until the point 10^2 is obtained. Draw a line from 10^2 to 15 and 15 to 16, which completes the pattern. Now trace a line through the intersection on the arcs, as shown by 10^1, 1^1, 4, 7^1 and 10^2. Then will 10^1 4 10^2 15 16 13 14 15^1 be the full pattern, with the seam coming on the line 10 15 in plan, Fig. 1. The round pipe above D C in elevation requires no pattern, as the end of the pipe is a right angle.

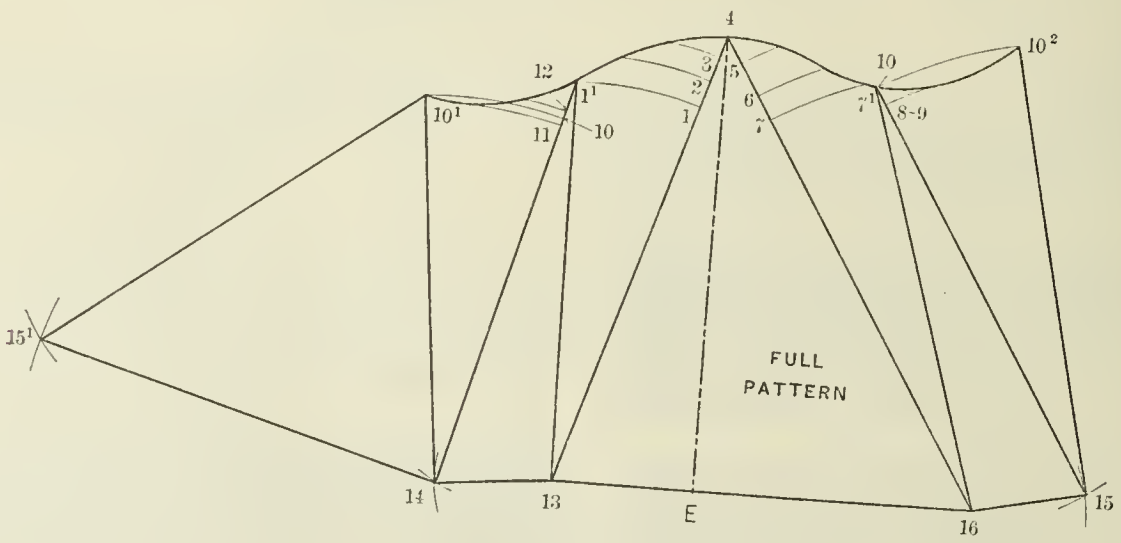

Fig. 6.—The Pattern Shape.

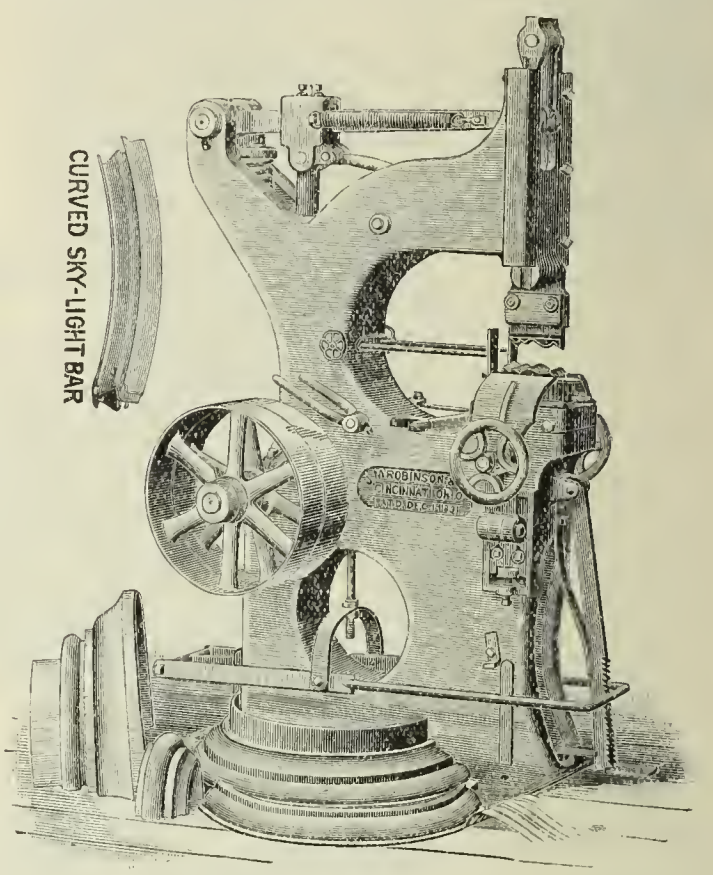
Machine Made Curved Skylight Bars.

All those who have to do with making skylights will be greatly interested in the adaptation made by J. M. Robinson & Co., Cincinnati, Ohio, of their curved molding machine to turn out a product of this sort, since there has long been a demand for machinery for producing curved skylight bars in place of the old process with mallet and wooden mold block. Robinson & Co., after some experimenting, have succeeded in producing perfect skylight bars with 6-foot radii, several samples of which sent out for inspection called forth very strong letters of approval. The accompanying illustration shows the machine, and also a separate view of the bar, and indicates the process of manufacture.



Machine Made Curved Skylight Bars.

To make the bars sheets are prepared by being cut to the required radii and width. Two of these sheets are

placed together and formed, after which they are separated and the top lap formed, one sheet being, however, wider for the lap. Next the two sheets thus formed are put together and the lap is closed over, thus securing the main bar. For the top cap plain sheets of the required length and width are taken and a small bend turned on the outer edges with a cornice brake. They are then hammered into shape with the curved molding machine, using suitable dies, thus completing the cap. For the bottom or clamp, cut sheets the proper length and width and bend an angle on the outer edges, finishing with the machine and dies, thus completing the skylight bar, cap and bottom clamp. The sample bar, for which we are indebted to J. M. Robinson & Co., illustrates the neatness and accuracy of the work done in this way, and would win the approbation of the most critical skylight maker.

FLASHINGS.

The firm of Watrous & Co., Troy, N. Y., consisting of Earl G. Watrous and Dennis J. Whelan, have been dissolved and Mr. Whelan has purchased all the property and assets which belonged to the late firm, including all accounts, and will continue the business under the name of D. J. Whelan. The business is the manufacture of Gutter Formers, Rotary Slitting Machines and Sheet Metal Machinery.

Gunster & Forsythe, Scranton, Pa., have done a fine piece of Architectural Sheet Metal work on the new department store building of Jonas Long's Sons. The building fronts on two streets, each front being 125 feet long, with an ornamental tower near the center.

Clark & Fischer are opening a Sheet Metal workshop for the purpose of manufacturing Sheet Metal Cornices, Clark's Sheet Metal Baskets, and to do all kinds of job work in those lines, at 714 West Locust street, Des Moines, Iowa.

Gara, McGinley & Co., 23 South Seventeenth street, Philadelphia, Pa., favor us with a folding advertising sheet, illustrating with fine half-tone engravings some of the Sheet Metal work which they do. The illustrations refer to interior work for ceilings and side walls. They present many different designs and two large interiors showing the application of the designs to ceilings in residences.

The Reeves Iron Company, Canal Dover, Ohio, will put their sheet mills in operation in a short time. This firm have recently made some extensive additions to their equipment which have considerably increased their capacity.

The Cambridge Iron & Steel Company of Cambridge, Ohio, manufacturers of Galvanized and Black Sheets, have decided to enlarge their plant by adding four additional trains of sheet rolls, consisting of two sets finishing rolls, one set roughing and one set cold rolls. The specialty of the company is galvanized sheet iron, the excellence of which has created a demand that necessitates the above extension.

N. & G. Taylor Company, Philadelphia, have lately furnished the largest ventilator we have ever heard of. It has a total diameter of 18 feet over all, the diameter of the neck being 10 feet. It is on the Midland Beach Casino, at Midland Beach, Staten Island. It is the Pancoast make, which appears to be giving such great satisfaction throughout the United States. This same make of ventilator was also used on the new Astoria Hotel, New York City.

A New Aluminum Solder.

We have received from Grant Hammond, 44 Chronicle Building, San Francisco, Cal., a circular giving particulars in regard to Hammond's solder and flux for brazing aluminum, which he is now placing on the market. Accompanying the same were several samples of aluminum with the edges joined by the new solder, including a piece of tubing, which, it is explained, was hammered into shape before brazing and subsequently spun and polished. The joints in the samples appear to be perfectly tight, and the tubing, in particular, presents an unbroken surface, looking as if it was actually seamless. Mr. Hammond states, nevertheless, that the brazing was done in an ordinary gas burner and is consequently not as neat a job as it would be with proper appliances. In this solder the inventor claims to have discovered a perfectly satisfactory and practical joining material for aluminum, and he predicts that aluminum ware, like silver, will in the near future be placed on the market with the edges brazed, they being butted together and no lap found necessary.

In support of his claims Mr. Hammond writes as follows: "Aluminum being a metal of nearly the same appearance as silver, and, like it, capable of assuming a high polish, it should be joined by a solder which will in no way detract from nor disfigure the looks of the article to be constructed. It seems that the great difficulty of joining the edges of aluminum satisfactorily has been not so much with the solders employed but for the want of a suitable flux. Chlorine, or a chloride in any form, will attack the metal. While in some forms it seems to give satisfactory results, still it is only for the time being, as joints so made will deteriorate and come loose. This is due either to electrical or chemical action, probably the latter, as the solder that has been used in such work is brittle from oxidation. This being the case, the flux then to be employed is one which will not attack the metal to remove the oxidation on the surface, but one which—the oxidation being otherwise removed—will absorb the oxide which always forms when heating the metal, and will evolve a greater heat along the seam where the metal is to be joined, and by chemical action will expel the oxide absorbed and alloy the edges of the metal.

"I have arrived at some definite conclusions in regard to alloys for soldering aluminum and for other purposes. I find that zinc is a metal that should not be used in alloys for soldering, if avoidable, as oxidation sets in until complete disintegration is effected. Inclosed * is a sample which when fused and rolled was a tough, tenacious alloy, but which in three months' time is as brittle as a piece of rotten bark, proving conclusively my above statement. Aluminum properly soldered with my solder will be as lasting as any of the other metals, and a man who is familiar with the use of solders, such as silver, spelter, &c., will be as successful with this after a few trials."

The following directions are given for using the solder and flux:

No lap is required in brazing aluminum with this solder. All that is necessary is to scrape the edges on ends, and the sides for not more than 1-32 inch back on both sides, making them thoroughly clean and bright, and making the ends fit perfectly; cut off a narrow strip of solder of the length required, scrape it clean and bright, and place it between the ends to be joined, they being butted together. Now, with a flat piece of wood or glass, place a considerable quantity of the flux along the seam—the operator will soon find out about the quantity of the flux to use. It is best to start in with a large quantity, then keep decreasing the amount with each experiment until the least quantity necessary for good work is ascertained. The strip of solder should be wide enough to project a trifle on each side. If the metal to be joined, for illustration, is 1-32 inch thick, the solder should be at least 1-16 inch, or double in width the thickness of the metal. In heavy metal it need only project about the same distance past each side as for brazing the above.

Everything being prepared as above stated, the metal is ready for heating, which can be done in almost any flame free from soot or smoke—gas, gasoline or heat from a brazier hearth. The heat should be applied from the opposite side to that on which the flux is placed. The higher the heat the better, so long as the metal is not injured. The amount can generally be told after a few trials, by spots of fire appearing along the seam. After these have stopped coming, and all smoke has disappeared from the seam, the union of the metal has been effected and further heat is unnecessary.

Heat should be applied the full length of the seam at once; that is, if the seam is 1 foot long, the flame should be nearly the same length, although the work could be done by passing backward and forward through a smaller one. Small work may be conveniently brazed by using a blowpipe. Blow holes may be filled by scraping clean, laying on a piece of solder, putting on flux, and heating. In doing the above there should be a large enough piece of solder to fill the hole, and it should also be forced into it or made to fit perfectly.

The metal does not need to be lapped, no matter how thin it is, as a butt joint is all that is necessary. The edges of aluminum 4-1000 inch in thickness can successfully be joined.

Aluminum can be brazed to almost any metal but iron, Mr. Hammond says, with his solder and flux.

The Navy Department at Washington has received information to the effect that a contract has been placed with an English firm for three new torpedo boats for the Russian Navy that will be easily the fastest war craft in the world. Their minimum speed capacity is placed at 38 knots per hour. As this immense speed will demand greater power than can be supplied by the ordinary type of torpedo boat engines, the craft are to be driven by steam turbines, having four separate shafts with three propellers on each shaft.

* The piece of metal referred to was found to be as brittle as the writer states.

HEATING AND PLUMBING.

The Correct View of the Situation.

The importance of having plumbing systems correctly planned and properly executed is conceded by those who are conversant with the subject. Good sanitary conditions in the home and business place are a public benefit, and those who labor to that end are to be commended. This is the correct view to take of the situation presented by the plumbers who are at work all over the country to secure legislation or agreements that will cause all plumbing work to be of a sanitary character. The plumbers have been specially active this year in their endeavors to have the work controlled by regulations and inspected by a competent official and to be done by men who under official examination have demonstrated their qualification for such work. In the absence of statute law they have endeavored to effect agreements that will control the sale of goods with the same object in view. They have been hampered in the accomplishment of this end by enthusiasts who take the narrow view of personal benefit and by their ill-advised remarks afford an opportunity for a wrong impression to be formed. This impression, though entirely wrong, is intensified by those who, though in the trade, do not sympathize with the work. As a consequence the effort to elevate the standard of plumbing work to the benefit of all has brought it prominently before the public. Those who do not look beyond the present struggle see only the strife as presented by the local press, which, unfortunately, has seen fit to present the case from a sensational standpoint. Throughout the country at the present time the work of the plumbers is receiving a great deal of attention, and much of the adverse criticism is due to a want of thorough knowledge of it. In some instances law suits have been started to test laws enacted and to find if the methods employed in some cases are not infractions of the rights of others. The vigor with which these cases are pressed would be relaxed if the indiscreet plumber had been more careful in his remarks and explanatory methods had been used instead of coercive methods, for the plan of "reasoning together" has prevented serious friction in the largest cities in the country. The tenacity of the trade to their purpose, which is commendable when viewed from the proper standpoint, is remarkable in view of the discouragements that have been met.

Milwaukee Plumbers' Examination.

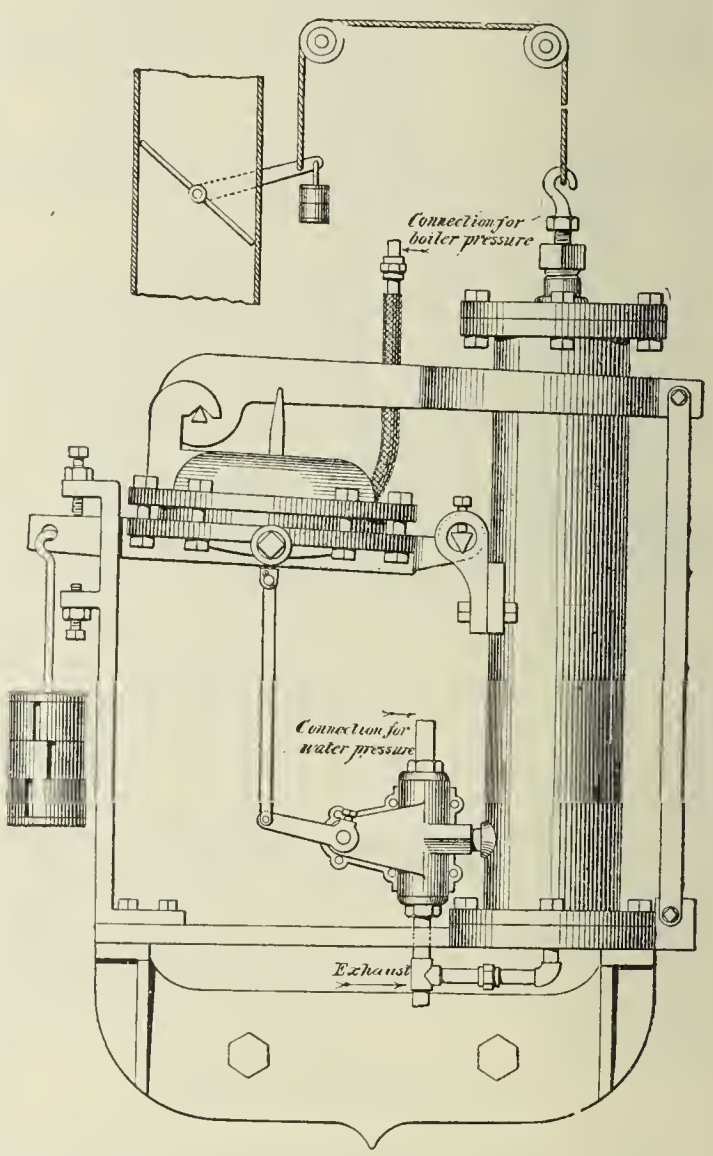
The examination of master plumbers of Milwaukee, Wis., by the commission comprising the members of the Board of Public Works—Plumbing Inspector B. O. Reilly and F. W. Pripps—was held yesterday and to-day, December 10 and 11, while the journeymen plumbers will be examined on December 13, 14 and 15. The questions that the plumbers will have to answer have been carefully prepared by Messrs. Reilly and Pripps, subject to the approval of the entire commission. The plumbers, after passing the examination, will have to take out a license, for which they will pay $1 each. The law requiring the plumbers to be examined and licensed is the creation of the master plumbers themselves, and its effect will be awaited with much interest.

Fernando W. Pripps, secretary of the commission, states that from 250 to 300 journeymen plumbers have expressed a desire to take the examination, and 125 to 150 master plumbers.

Giblin & Co., Utica, N. Y., report their Boiler business unusually good for the past three months and are now obliged to run overtime in order to fill orders. Among the recent sales of Standard Sectional Boilers, made by themselves or their representatives, are the following, in which Steam Boilers have been selected: Norwood Hotel, Auburn, N. Y.; Norwood, R. I., schoolhouse; residence S. F. Littlefield, Wakefield, Mass.; residence John Baty, Dover, N. H.; sanitarium at Penacook, N. H.; residence Robert Lehman, Tacoma, Wash. In the residence of T. B. Rowell, Beaver Dam, Wis., and greenhouse of George Boyce, Utica, N. Y., Hot Water Heaters will be used.

The Improved Climax Damper Regulator.

In the accompanying illustration we present the Improved Climax damper regulator, manufactured by Kieley & Mueller, 11 West Thirteenth street, New York City. It is designed for use with steam boilers for so controlling the draft as to maintain a uniform pressure of steam, and is said to be so sensitive in its operation that it will work on ½ pound fluctuation in the pressure. As will be seen



The Improved Climax Damper Regulator.

by the illustration presented herewith, a connection is made from the boiler to the diaphragm, so that in case the steam falls below a desirable pressure the weights will operate the lever controlling the valve which operates the piston connected with the damper by means of water pressure. A slight reduction in the steam pressure which causes the downward movement of the diaphragm operates the valve, shutting off the water supply and allowing the water in the piston chamber to escape. The weight attached to the damper lever then is sufficient to raise the piston and open the damper to increase the fire and raise the steam pressure. The device may be set to work under any pressure, weights being provided for this purpose and set screws being provided for a still closer adjustment. The water used in operating the damper may be either taken from the house supply or in instances where there is no such supply a connection may be made with the boiler below the water line for the purpose. This valve is now in use in a number of large buildings in New York City, where during the day it is only necessary to produce

a sufficient quantity of steam to run the elevators and a few of the electric lights, while in the latter portion of the day and evening steam pressure must be developed sufficient to carry the entire lighting system of the building. It is pointed out that under such conditions it effects a saving in fuel and secures a more satisfactory service through maintaining a steady pressure and relieving the various parts of the machinery from the strains that ensue when the pressure is variable. The construction is said to provide against corrosion and undue friction, so that the sensitiveness of the regulator will continue after long service.

Laying Gas Pipe.

Those who have experienced the vexation of their customers at having their lawns cut up and more or less disfigured by the process of pipe laying will find the method described by Charles Lurcott in the *Scientific American* of practical interest. Mr. Lurcott was desirous of putting in the gas in his amateur workshop, which is 24 feet distant from the house. To avoid digging the customary trench across the lawn, and the permanent disfigurement which follows, he determined to bore a hole through the soil from the cellar to a point below the floor of the shop. The boring apparatus was extemporized out of a piece of 3-16 inch flat iron, a ¾ bar, some 6 foot lengths of piping and a carpenters' brace. The flat iron, 3-16 x 1 inch and 2 feet long, was bent cold with a twist of half a turn in 6 inches at one end, the other end being scarfed and riveted to a 6-foot length of ¾-inch round iron. The opposite end of the ¾-inch iron was threaded into a ⅜ inch pipe coupling, and with the addition of three 6-foot lengths of ⅜-inch pipe and couplings the apparatus was complete. To connect the carpenters' brace with each piece of pipe as the boring proceeded, a short length of ¼-inch pipe was screwed into a ⅜-inch cap, its other end being filed square so as to enter the brace. With this simple and cheap boring machine completed all that was necessary was to remove a stone in the cellar wall and commence boring. The auger cut its way rapidly through the soil and in just 15 minutes a hole large enough for an inch gas pipe was made for the required distance of 24 feet. The auger cut its way without any tendency to swerve out of line, and had any rocks been encountered it would have been easy to dig down and remove them.

It should be added that the ground at the time was frozen and covered with snow, and any one who has had to dig a trench under such circumstances will appreciate the saving of labor attending the methods of pipe laying employed by Mr. Lurcott.

Plumbing Laws in San Francisco.

We have the following letter from John L. E. Firmin, San Francisco, under date of December 3, which the trade throughout the country will be interested in reading. The San Francisco plumbers are having a hard fight, but they appear to have right on their side, and the side with right on it is sure to win in the long run. The wave of plumbing laws which has swept across the continent is not going to stop at the Sierra Nevada Mountains, and if it should hesitate there Mr. Firmin can rest assured there are many in the East who will do what they can to push the tide of reform clear to the Pacific Ocean :

A great battle is now on between the Board of Health and the Association of Master Plumbers of this city (as representing the march of sanitary science and its practical application) on the one side. On the other side are the real estate agents (who claim to represent the interests and welfare of 75 per cent. of our citizens), who have organized with the especial purpose of defeating and destroying the rules and regulations formulated by the Board of Health for the protection of our citizens against preventable disease, as comprehended in accepted, logical and just rules and regulations governing plumbing. The especial features which the real estate agents would attack are the registration of plumbers, filing of plans, and the jurisdiction of the Health Depatrment over any class of plumbing not coming under the head of "buildings hereafter erected." Practically, they would nullify the results of the sanitary legislation of the past 16 years.

For past week skirmishing all along the line; to-day, first battle. Have consented to a continuance of 30 days, so as to permit of a full hearing of the question. A certain daily paper, the *Chronicle* (an old enemy), for the past week has published columns of the most outrageous abuse of the advocates of plumbing legislation, claiming we are fit candidates for the State's Prison, &c. The entire press, so far, has been closed against us, and would not print our views, either as news or as paid advertisements, even at exorbitant rates. Considering the great advertising patronage of the real estate agents we dare hardly hope for a fair voicing of our views through the daily press. We trust, however, that a sense of their duty to humanity, and a regard of public weal, will cause them to at least give space to both sides. In spite of all obstacles we shall continue the fight, and to a finish. We know we are right, and feel certain of the support of the true public opinion. We are satisfied we shall win, no matter what guise may be assumed by pretending public benefactors.

You of the East would be surprised to note the lack in our rules of certain essential features of sanitation. For instance, as yet we have been unable to apply a "final test" rule to our work (new or old).

Selling Boilers by the Pound.—The question is brought up by some manufacturers of steam and hot water house heating apparatus whether it would not be a good idea for them to make a pound price on their heaters. The claim is advanced that the craze for cheapness has caused castings to be made thinner and thinner, to reduce the cost of the apparatus. This has been at the expense of durability, but that is lost sight of in a comparison of prices by the builder or house owner. Those who favor the pound price believe that if a buyer should be given his choice at a rate per pound, he would be less likely to take the lighter article, as the cause of its cheapness would thus be made plain to him.

NOTES.

The Hartford Heater Company, Hartford, Conn., have been awarded the contract for a steam heating system for the First Baptist Church.

J. A. Allen, Des Moines, Iowa, has removed his plumbing establishment to 518 East Walnut street, where he will carry a line of supplies for plumbers and gas fitters and also a line of Electric Goods.

A number of Minneapolis plumbers have recently changed their local address. The Worthingham Plumbing Company are now at 209 South Third street, W. S. Bayley has moved to 58 South Seventh street and George S. Lyon is now established at 426 South Sixth street.

The Cleveland Automatic Gas Machine Company have favored us with a copy of their latest catalogue of their machine for the manufacture of gas on the premises of the owner. The machines are made in different sizes, adapted for residences or for larger buildings and factories. Engravings show kitchens in which gas ranges are run with gas and other engravings show a number of solder furnaces in a factory and the gas lights for illuminating the workshop, all of which gas is supplied by their machine. The gas is automatically generated from gasoline, a suitable tank for storing the gasoline being buried at a convenient distance from the building, the gas making apparatus being located in the basement where attention can readily be given to it. A feature of the catalogue is a large number of testimonial letters from those who have used the machine with good results in various sections of the country.

In some of the modern bathrooms where luxury predominates a platform scale of fine finish is one of the fixtures for the convenience of those who wish to keep informed as to their weight.

W. W. Griffiths of the firm of Griffiths, Niedermayer & McGuckin, 1015 Christian street, Philadelphia, was a recent visitor to *The Metal Worker* office. Mr. Griffiths reports that the demand for the IXL Beer Pump is increasing and that good reports come from its operation all over the country.

O. C. Knox has sold his plumbing business on Exchange street, Chicopee, Mass., to Edward and Charles O'Brien.

Blake & Murphy, Moline, Ill., have purchased a lot on which they propose to erect a plumbing establishment.

James F. Cahill has been appointed Plumbing Inspector of Utica, N. Y.

The Cincinnati Chapter of Architects are giving considerable attention to plumbing and at their next meeting a paper on modern plumbing will be read by Richard Murphy, a well-known plumber.

R. H. Walker, Elmira, N. Y., has recently completed the heating and plumbing of the Bradford County House at Towanda, Pa.

The Naugatuck Mfg. Company, Naugatuck, Conn., manufacturers of Seamless Copper Ball Floats for receivers, steam traps, regulators and for open tanks for plumbers' use, advise us that business has increased to such an

extent that they have been compelled to seek larger quarters. They are now located in a well equipped and much larger factory near the business section of the city.

The new building of Jonas Long's Sons, at Scranton, Pa., was equipped with a power and electric plant by Francis Bros. & Jellett, Philadelphia and New York, who furnished Boilers of 300 horse-power. The heating work was done by Gaylord & Eitapenc, Binghamton, N. Y., and the plumbing by P. F. & M. F. Howley, Scranton.

C. L. Smith has opened a plumbing shop at 24 West Eighth street, Anderson, Ind. A special feature of his opening was the reservation of the time from 2 to 5 in the afternoon for the reception of ladies.

Mayor Harrison of Chicago, Ill., has appointed the following board to examine and license plumbers in accordance with the new State law: Commissioner of Health J. Reynolds; Charles Brewer, a master plumber; Frank Kennedy, a journeyman plumber, and Andrew Young, Chief Sanitary Inspector of the Department of Health.

L. Farenthold, Jr., plumber and hardware dealer, Weimar, Texas, has gone out of business.

Walter Hutchinson has been elected Inspector of Plumbing at Norristown, Pa.

A circular of the O. S. Distributing Fitting is received from 111 Beekman street, the New York office of Oliver Schlemmer, Cincinnati, Ohio, which shows clearly how time, material and labor may be saved and better work accomplished by its use. It is hardly necessary to read the text, for the illustrations present the advantages for use on hot water work so that they cannot be misunderstood. Another circular shows the benefit of the Temple Vent Fittings to the plumber with an equal clearness.

Hon. W. C. Whitney, ex-Secretary of the United States Navy, is building a palatial residence for his winter home, at Aiken, S. C., and is equipping it with the best modern sanitary appliances. A hot water heating plant is now being installed by Geo. B. Cobb, Jr., superintendent for the Geo. B. Cobb Company, heating and ventilating engineers, 44 Centre street, New York. Mr. Cobb is to be congratulated on having charge of such an important piece of work.

The Hawks Hardware Company, Goshen, Ind., have secured some big Michigan contracts through their representative, C. H. Maloney. They were awarded a contract for heating and plumbing the Arlington Hotel, Petoskey, Mich., and have secured a contract for heating a hotel at Sheboygan, Mich. These two contracts aggregate about $3000. During the past four months the company have secured about $8000 worth of contracts outside of Goshen for heating and plumbing.

A plumber who was proceeded against for doing work at La Crosse, Wis., without a license, defended his action by pleading that the State law was unconstitutional. The judge decided the law was constitutional and inflicted a fine.

Edwin S. Summons, 209 North Sixth street, Reading, Pa., has taken into partnership Elmer J. Cake and H. W. Brossman, and the firm will be known as the E. S. Summons Plumbing & Heating Company. Mr. Cake was in the employ of Mr. Summons for 20 years, and Mr. Brossman is a well-known bookkeeper.

Samuel Whitcomb has received a plumbers' license and will engage in the business for himself at Bellefontaine, Ohio.

An amendment has been passed in Minneapolis, Minn., to the plumbing ordinance requiring that all applicants for plumbers' license shall present a certificate of competency from the State Board of Commissioners of Practical Plumbing.

Henry H. Guernsey, New Haven, Conn., was in New York this week, visiting the trade preparatory to engaging in steam and hot water heating as another branch to his business.

The semi-annual meeting of the National Association of Master Plumbers of Great Britain and Ireland was held at Bradford November 10, and was largely attended. The reports of the meeting show a lively interest in association matters and an increasing strength and usefulness. The association is following the methods that have proven successful in the United States.

The declaring invalid of the St. Louis, Mo., smoke abatement ordinance, says a St. Louis paper, by the Supreme Court, will prove a severe blow to the progress of St. Louis unless some method is found to mitigate the effect which is sure to follow the decision. As a result of the activity of the Smoke Abatement Association in St. Louis, a marked improvement in the atmosphere of the city took place. Smoke consumers were put on thousands of the big furnaces in the center of the city, and the smoke blanket which blackened St. Louisians internally and externally was lifted. Will the blanket be put back, now that the smoke abatement law has been knocked out? It is to be hoped that other means will promptly be devised to maintain the gains made by the smoke crusade up to the present.

Samuel Holmes.

Samuel Holmes died at Montclair, N. J., on December 9, at the age of 75 years. He was born at Waterbury, Conn., and in early life connected himself with the Scovill Mfg. Company, subsequently becoming the manager of their New York City branch, which position he held until 1873. In 1876 he became treasurer of the Bridgeport Brass Company, and acted as their New York representative, from which place he retired in 1890. Mr. Holmes for over 50 years took an active interest in religious, educational and philanthropic work. He leaves a widow, four daughters and one son.

Paper Bottles.

A German paper maker, says an exchange, has recently obtained letters patent on bottles made of paper, for use on board of ships particularly. In bad weather much damage has been done by the breaking of bottles of wine and other liquors in the storerooms of vessels, in spite of every precaution. The new bottles are made of a composition which, with the solution in which they are made water tight, is still the inventor's secret. After being impregnated with this fluid the paper bottles are slowly dried in gas stoves, this process of drying being watched carefully, otherwise the bottles would remain porous and allow the fluid contents to leak out. These bottles can be handled very roughly without the least apprehension of damage or destruction.

A New Tinting Process.

A new process has been introduced in Paris, says an exchange, for giving pottery, wood, glass, metal and paper the tints of the soap bubble. The colors of soap bubbles are due to the film of water causing some of the waves of light reflected from its inner and outer surface to cancel each other and produce tints. The same effect is seen in films of oil or tar on water, in scales of old glass and in pearls. Hitherto the process of coloring in the same way has been applied only to paper, but it is to be extended to many other substances. A thin plate of transparent liquid, consisting of turpentine or rectified benzine, containing a little gum damar, if the paper is white, and Judean bitumen if it is black, is spread over the wetted paper. When dried on the surface this film gives a rainbow or iridescent appearance to the paper.

Standard Foundry Supply Company have been organized for the manufacture and sale of Foundry Cupolas, Center Blast Tuyeres and Castings of all kinds, with the business office at Rutherford, N. J., with capital stock $125,000, divided into 2500 shares of $50 each, and to start business with $5500. Incorporators: W. J. Cole, Rutherford; W. K. Cessna, New York City; John M. Scott, Ithaca, N. Y.

Years of experience have prompted an iron manufacturer to remark that it is a peculiar characteristic of the iron and steel business that as soon as orders fall off the manufacturer or merchant acts as if the world had suddenly decided to quit using iron.

The November fire loss of the United States and Canada, as computed by the New York *Journal of Commerce*, amounted to $7,189,800. This is about $2,000,000 greater than the sum charged against the same month in 1896, which showed exceptionally light losses, but it is $3,000,000 less than in November, 1895. The total fire loss for the 11 months ended November 30, 1897, is $98,991,000, against $104,293,500 in the same months of 1896 and $119,820,900 in 1895. Unless some conflagration running up into millions takes place this month the year 1897 will show a great reduction in fire loss in comparison with 1895, and will be materially less than the record of 1896. The fire underwriters, says the *Journal of Commerce*, have had a very fortunate year, as they have maintained high rates at nearly all points throughout the United States. Their forthcoming annual statements will probably show that 1897 has been for them the banner year of the decade.

Sydney H. McLane is building a small steel steamer at Ballard, Wash., for the Yukon Commercial Company, to be used in the Yukon river trade. The builder purchased his shipyard machinery in Chicago.

TIN PLATES.

Tin Plate Machinery.

A large catalogue has been received from the Frank-Kneeland Machine Company of Pittsburgh, engineers, founders, machinists and manufacturers of tin plate and sheet mills. The property of this company is well located for convenient receipt and shipment of supplies and finished product. The engineering and drafting departments are in the hands of men of long theoretical and practical training, and whose personal and financial interests are bound up in establishing engineering works second to none in the country. Complete records of all work are kept in fire proof vaults and parts can be duplicated at any time. The pattern department is under the supervision of one who knows how to produce these so-called expensive necessities with rapidity, and so designed that good castings can be made at reasonable cost. The foundry has capacity of 75 tons of iron per day, and is supplied with two 20 ton and one 7-ton electric traveling cranes. Core drying ovens, casting pits, cleaning barrels, elevator, plenty of daylight and head room are the main features. Tandem with, but separated by an area of 25 feet, and connected by a standard gauge track, is the roller machine department, covering 100 feet wide by 180 feet long, and having two galleries 20 feet wide. The clear lift under the cranes is 30 feet, the cranes being two 20-ton of the electric type. The latest improved lathe boring and turning machines capable of handling any class of work likely to be presented are provided. The roll department is located at one end of the machine shop building and is equipped with ten powerful lathes, including a lathe of special design for testing, heading and centering each roll whether it is to be shipped in the rough or to be finished by the company. These lathes are directly under and are served by the electric traveling cranes. The following portion of the catalogue contains engravings of roll turning lathes, shears and punches driven by steam or electricity or power. Following them are views of works which have been equipped by this company, the closing pages being devoted to structural mill housings, and bar and blooming mills, hydraulic, jib and whip cranes, &c.

New Tin Plate Plant in Ohio.

Wm. H. Banfield of Wallace, Banfield & Co., tin plate manufacturers, at Irondale, Ohio, has recently purchased about 20 acres of ground in East Liverpool, Ohio. It is the intention of Mr. Banfield, in connection with others, to erect on this site a six mill tin plate plant. It will be equipped with all modern machinery and will be a model plant throughout. Work on the erection of the plant is expected to commence shortly after the first of the year. It is the intention of Mr. Banfield to still retain his connection with the firm of Wallace, Banfield & Co., and he will continue as superintendent of the present plant at Irondale, and will also superintend the new plant at East Liverpool. The firm of Wallace, Banfield & Co., however, have no connection with the East Liverpool enterprise, and will not remove their office to that place as stated.

SCRAP.

The December calendar blotter issued by Follansbee Bros. Company, Pittsburgh, Pa., is of a seasonable character. The calendar is displayed on the bricks of a snow-capped chimney, and the main illustration—a child loaded with the gifts of Santa Claus—gives point to the catch-word, "Satisfaction," as applied also to the user of Scott's Extra Coated Roofing Tin.

The New Castle Steel & Tin Plate Company, New Castle, Pa., are reported to be equipping their hot mill plant throughout with 26-inch rolls in place of 24-inch. This is being done in order that the rolls may correspond in diameter to those now being built for the new Shenango Tin Plate Company, whose interests will be consolidated with those of the New Castle company.

O. M. Hartzell, who is actively connected with the recently formed Neshannock Steel & Tin Plate Company, New Castle, Pa., was in New York last week visiting the trade. Mr. Hartzell for some time past has been engaged in the Iron and Steel brokerage business in Pittsburgh, Pa.

Yet another Tin Plate plant is reported to be among the probabilities in the New Castle, Pa., district. Robert J. Scott, with other Pittsburgh capitalists, are said to be figuring on a six-mill works, to be erected somewhere between New Castle and Mahoningtown.

The Robinson Rea Mfg. Company, Pittsburgh, Pa., have received an order from the Monongahela Tin Plate Company of that city for five additional Tin Mills. This will increase the Monongahela works to a 16-mill plant. The whole plant will be remodeled, in both the hot mill and cold roll departments.

E. G. Lauck of Pittsburgh, Pa., has assumed charge as superintendent of the United States Iron & Tin Plate Mfg. Company's plant at Demmler, Pa.

President M. M. Garland of the Amalgamated Association of Iron and Steel Workers, who recently returned to Pittsburgh from a tour of inspection in Ohio, stated in an interview that he had found the Ohio Valley Tin Plate works generally busy and well filled with orders. He said that the indications are that the Tin Plate workmen will have steady employment through the winter.

The Tin Plate plant of the Stickney Iron Company, at Canton, Baltimore, Md., leased by the Humbert Tin Plate Company, is scheduled to begin operations next Monday. About 100 men will be employed at the works, half of whom will come from Pittsburgh and Connellsville, Pa.

The Crane brands of Roofing Tin form the subject matter of a neat circular issued by the Irondale Steel & Iron Company, Richmond, Ind., with works at Middletown, Ind. These Terne Plates are of three qualities—namely, Crane Old Style, with a guaranteed coating of 35 pounds to the box; Crane Extra Coated, with 20 pounds of coating guaranteed, and Crane, a Worcester Grade Plate. We are advised that the Tin Plate plant of the Irondale Steel & Iron Company is now in excellent condition and has been running to full capacity for several months past. The firm have a good business in Coke Tins for special purposes, where softness, good finish and accurate weights are required, and are also having a good trade in high grade Terne Plates.

The official Treasury figures of Tin Plate imports into the United States in the month of October, 1897, place the value of such imports at $203,031, as against $409,402 in October, 1896, a falling off of over 50 per cent.

The Question of Electric Wiring.

The question whether electric light wiring should be paid for by the consumer or by the electric lighting company has often been debated in the United States. England seems to have answered the problem satisfactorily by the adoption of a system known as "free wiring." The name is a misnomer, says the Boston *Journal of Commerce*, as the system really consists in making the consumer pay for the wiring on the installment plan; that is, by tacking on so much more to his monthly lighting bill. The idea of free wiring first originated with a syndicate which proposed to accept payment for the wiring of houses by a certain sum paid by the householder for every kilowatt hour of electrical energy metered to him, this sum being naturally in addition to that paid to the supply company in the usual course. This could only be done with the concurrence of the supply company, but it is easily imagined that this was not difficult to obtain. It is especially in the less wealthy residential districts that such a scheme finds favor. There are numbers of householders who consider it too extravagant to pay for the wiring of a house already, perhaps, fitted with gas pipes.

The recent remonstrance by a number of users of natural gas in Ontario, Canada, against the piping of Canadian gas into the United States has been followed by a counter movement on the part of the interests engaged in the traffic. Another deputation from the natural gas fields in the vicinity of Windsor, Ontario, recently waited on the Dominion Government. It consisted of owners of wells, who desire that there shall be no alteration of existing arrangements. They want to be free to continue piping the gas to Detroit.

THE RETAIL STORE.

The Mighty Mite Folding Gasoline Stove.

A novel folding gasoline stove is being introduced to the trade by the Mighty Mite Stove Company, Room 314 Northern Office Building, corner La Salle and Lake streets, Chicago, Ill. It is known as the Mighty Mite, and is of such construction that it can be readily folded into a box 7 x 7 x 3¾ inches and carried about in the same manner as one would carry a hand satchel. It is referred to as being especially adapted for hunting and fishing parties, for yachting and picnics, and for all who have occasion to do light housekeeping. Among its novel features may be mentioned the fact that it is so constructed as to render it impossible to fill the tank while the burner is lighted, for the reason that the instant one turn is given the filler plug to remove it, the air escapes and the flame goes out. The stoves are made of tin and brass, the tin ones being enameled and striped, while the brass ones are either burnished or nickel plated. The flame due to the pressure is said to be exceedingly hot, and that while an ordinary stove will boil a gallon of water in from five to eight minutes, the Mighty Mite will do it in five minutes. A single burner construction weighs only 5 pounds, and will heat for eight hours without refilling, while the double burner stove will heat for 12 hours without refilling. The statement is made that the double burner stoves have considerably more than twice the tank capacity of the single ones, and will fold into a box 7 x 17 x 3¾ inches, while the three-burner stove will fold into a box 7 x 26 x 3¾ inches. In Fig. 1 of the accompanying illustrations we show the appearance of one of the stoves open, ready for use, while in Fig. 2 is shown the stove folded into its box ready for carrying about.

Window Display as a Means of Advertising a Store.

BY C. F. C.

One of the most important means of advertising connected with any store is its show windows. Within a comparatively short period of time this has become a recognized fact in nearly all lines of business. In retail Hardware, however, the development along this line has not been so marked as in other trades. This may be due to the fact that it is a difficult matter to make an effective window display of Hardware. There are very few, if any, goods in this line which can be draped as are the cloths in dry goods or clothing displays.

MINIMIZING THE DIFFICULTY.

This difficulty can be partially overcome by covering the floor of the window with black calico or "print," as it is known among dry goods men. This should not be confused with black cambric. The calico is a dead black, while the cambric has a shiny appearance that detracts from the goods and injures the eyes. Sometimes it is well to cover the side walls of the windows with this material also. Then by means of brass screw hooks bright goods can be made to stand out well thereon. By carefully placing these hooks small articles can be arranged to form letters or designs. Some goods will show to better advantage upon red cotton flannel than upon black calico, but the flannel is more expensive and less durable. The red soon fades and the cloth has to be replaced oftener than when black is used.

It is often well, when tacking cloth upon side walls, to drape it in folds instead of tacking it flat. This requires more material, but secures a more pliable and pleasing effect. In windows where heavy Hardware and Stoves are to be displayed, it is better to use a neat pattern of oilcloth or linoleum for a floor covering.

A handsome floor can be made with pieces of tiling which are often left from tiled fire places or floors. These pieces should be arranged systematically. A good plan is to use white for the center with perhaps three other colors carefully placed to form a border. These pieces are placed loosely on the floor of the window, and there is opportunity for great variation of design. The tiling can be washed with a damp sponge whenever the window is changed and cleaned. There is no handsomer floor than this upon which to show enamel bath wares and bathroom equipments. In showing these goods, however, they should be set up apparently ready for use. This makes the display much more attractive than if the goods are set in the window regardless of effect.

TOO MUCH VARIETY A COMMON MISTAKE.

One of the most common errors made by Hardwaremen in window trimming is the use of too great a variety of merchandise. A window, like an advertisement, should be simple and straightforward. It should show all that can be conveniently shown about some one article before it attempts more. True, a window trimmed with a great variety of goods may be exceedingly pretty, but prettiness alone is not effectiveness; it doesn't always sell goods. To illustrate this, the two window displays of a certain Hardware store noted recently will be good examples.

One window had as a center a revolving show rack that consisted of three round tin shelves mounted upon a center iron rod which ran through the rack and extended from the floor of the window to the top. This was kept revolving by a small electric motor that operated in plain view of the passers-by. The motor was supplied with electricity from batteries situated under the floor of the window. This rack was tastefully trimmed with light articles, and in itself was a good attraction, as a moving display nearly always arrests attention. But that was not all that the window contained. On the right was a Knife case containing nearly a gross of Knives of different sizes, shapes and finishes. On the right side wall were shelves filled with Agate Ware. Upon the left, a little toward the back, was a board covered with black calico, upon which several Electric Bells were displayed. From arms attached to the left side wall various articles of Tinware were shown. The floor of the window underneath and around the revolving center rack was occupied by numerous Kitchen Knives, Cleavers, &c., carefully arranged. This window had a neat, well kept appearance, but there is a doubt as to whether or not it was a good selling medium. The trouble lay in the fact that there was too much displayed. Although the goods were well arranged no one article predominated. In order to gain a definite idea of the contents of the window a person would have to stop and study it. This the public seldom does.

The other window was much plainer, and at first glance did not seem so attractive, yet it proved to be more

effective. The principal articles shown were Oil Heaters and Tubular Lanterns. The Lanterns were hung from racks in three rows across the back of the window. There were two colors, blue and plain tin. Each row was an alternate color. Two rows were hung from hooks in the ceiling of the window, the blue being hung outside and the tins back. These two rows were so arranged that one plain Lantern was shown between each two of the blue. This gave the top of the window the appearance of being hung more full, and at the same time relieved the monotony of rigidly straight rows. Each row of Lanterns was plainly marked with the price, which, by the way, was a special one. On the floor of the window were a number of Oil Heaters, arranged in semicircular form. This added more relief to the straight lines of Lanterns at the back. Three or four Lanterns, hung at irregular intervals, were all that the side walls could boast of. This window sold a great many Lanterns and several Oil Heaters.

Less work was expended upon it than upon the other. Less goods were used in its display. Yet the plain window was the more effective advertisment.

CHANGE DISPLAYS OFTEN.

Another fault of the average Hardware merchant is that he doesn't change his window displays often enough. Under ordinary circumstances windows should be cleaned and redressed at least once a week. Sometimes it is advisable to change them even oftener. It is as important to keep the show windows fresh and attractive as it is to keep newspaper advertising so. It's a good plan to make the show windows co-operate with the newspaper advertising. Goods which are being advertised in the papers should be displayed in the windows This plan will strengthen the newspaper advertisement and make it more effective. At the same time the advertisement can be made to call attention to the window displays.

Large show windows are not placed solely to beautify a building, nor for lighting purposes alone. Their purpose is to display goods. They're valuable advertising media, and as such they should be cared for in a way that will produce the best results.

The Proposed Enameled Ware Combination.

The situation concerning a consolidation of enameled ware and tinware interests appears to be about in the same condition as when last referred to. Conferences and consultations are still being held, and much energy is being put forth, but it is pretty certain that so far little other than negotiations of a preliminary character have occurred. There are rumors, more or less well authenticated, that the project is likely to assume definite form before the New Year, so far as four of the larger companies are concerned, with the expectation that later some who are still undecided will cast their lot with the new concern as soon as an equitable basis has been arrived at.

Johnson's Portable Harness Shop.

The accompanying cut represents a saddlers' horse and necessary tools, offered by Eugene L. Johnson, 33 Carlisle Building, Cincinnati, Ohio. The Portable Harness Shop, as it is called, includes a nicely finished box, 18 x 8 x 5 inches in size, with a lid or seat of solid oak, securely attached with wrought steel hinges. In one end of the lid a heavy iron socket is set flush with the top, and so arranged that the sewing clamp or vise may be put in position in a moment, solid and in proper position for either a right or left handed man, for sewing harness or filing a key, saw, &c. The clamp is made of iron, and is referred to as strong and serviceable, and neatly japanned. The point is made that when the operator is seated upon the box the weight of the body gives it solidity. The box is furnished with an adjustable sewing awl haft, saddlers' straight and bent awls, a wrench, paper of harness needles, ball of linen harness thread, shoemakers' wax, a box of bifurcated rivets, rivet set and a file. The shop is designed to retail for $2, and is recommended for the use of farmers, liverymen, ranchmen, coachmen and others.

Johnson's Portable Harness Shop.

Snap Shot Mouse Trap.

The Specialty Novelty Company, 43 East Marion street, Lancaster, Pa., are manufacturing the Snap Shot mouse trap here illustrated. It is made of a square block of wood with a hole on each of four sides. The main feature of this construction is the ease and rapidity with which each wire can be set, which is accomplished by raising the free end of the spring and resting it on a small projection punched in the loose metallic flap. Inside the hole is a steel pin on which to secure the bait. The mouse in pushing its head in so alters the position of

Snap Shot Mouse Trap.

the flap that the spring is released and the animal caught and killed without mutilation. The traps are finished in red. Allerton-Clarke Company, 97 Chambers street, New York, are general agents for this article and C. B. Corwin, 15 Whitehall street, New York, handles them for export.

Baldwin Refrigerators are the subject of a 44-page pamphlet issued by the Baldwin Refrigerator Company, Burlington, Vt. The extensive and well-known line of Refrigerators made by this concern are fully illustrated, descriptions are given wherever needful, and tables of sizes and prices are likewise presented, so that the dealer wishing to handle these goods can get all necessary particulars from the convenient pamphlet which the company distribute.

Sales Record of Cook Stoves.

The accompanying reproduction of a portion of a page from a sales record illustrates a system in use by the Fulton Hardware Company of Portland, Ind., for keeping a record of goods sold. A complete memorandum is thus presented of each Cook Stove sold—the date of the sale, name of the purchaser, name, style or number terms, selling price, cost, date of purchase, of whom purchased and remarks. This gives a condensed but comprehensive chronicle of the entire transaction, and it becomes of greater value every year as a reference book. From a record of this kind repairs for the article sold can be ordered at any time, without waiting for particulars to be furnished by the purchaser and the annoyance of delays and errors. At the end of each month or year the merchant can determine whether a certain line has been a profitable one, can see how many goods have been sold and note the most salable sizes, styles or kinds. The record is considered of sufficient importance by the company to justify them in recommending any merchant to have one made to order, of any desired capacity from one to ten years. Of course it should be kept up to date. The company use this form of record for Cook and Heating Stoves, Steel Ranges, Bicycles, Breaking Plows, Harrows, Walking and Riding Cultivators, Binders, Mowers, Wagons, Drills, Hay Rakes, Corn Planters, Hay Carriers, Refrigerators, Buggies, Carriages and Creameries. From two to ten pages of the record book is set aside for each of these lines of goods, and only one class of goods is entered on the same page.

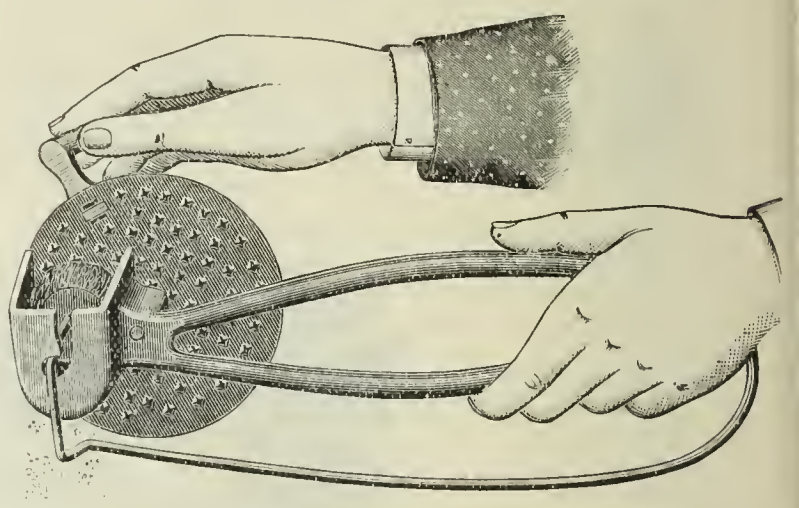
Rotary Nutmeg Grater.

The Specialty Novelty Company, 43 East Marion street, Lancaster, Pa., Allerton-Clarke Company, 97 Chambers street, general agents, have improved their family rotary nutmeg grater as here shown. One of the changes is in the construction of the handle and wire spring, the spring exerting a pressure on the nutmeg, automatically holding it against the grating surface so that all of the nut can be used and yet not allow the two metal parts to come in contact with each other. The grater has been



Family Rotary Nutmeg Grater.

strengthened and stiffened by backing it up with a wheel-like plate of which the handle is a part. The whole utensil is tinned. For export they are handled by C. B. Corwin, 15 Whitehall street, New York.

Programme Advertising.

BY H. C. W.

Will some one kindly suggest a cure for the horrible disease known as "Programme Advertising?" Absolutely the most worthless account that ever entered into a business man's calculations—unprofitable, unpleasing, maker of hard words and hard thoughts. It is more than a problem—it has become a menace—it is held over you as a threat by men you do not care for, more often pressed on you by women you never saw and never will see again, yet who insist that all their trading and their neighbors' trading is done with you. Your answer may be No; they will not take it—"the space costs so little," and they have just this one to fill; the price is invariably three to five times as much as any good newspaper contract you may have, with a valuable circulation of thousands as against any programme's dozen readers You have seen the dummy they carry, laid out in beautiful little blocks and walks and lines of landscape gardening. It is blackmail pure and simple, each little block ranging from $5 to $50—depending on how much they have determined you shall contribute to the festival.

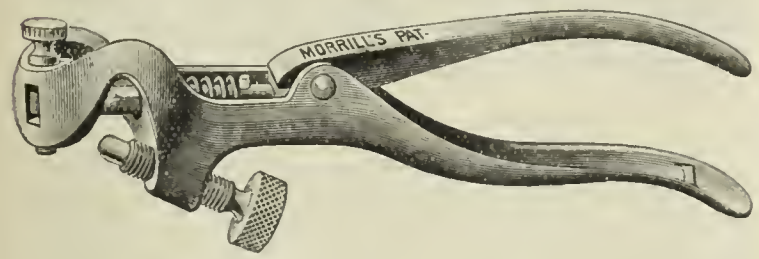
Help us out, somebody—give us some suggestions of value and remedy. They will be on hand in a few days; this is their time for coming, and every day from now on till the welcome spring time will they make their meaning perfectly clear to you in language and terms not to be misunderstood. The daughters of all the known societies are religiously engaged in it, and they gather together and count the results as a miser counts his gold.

With any followers, I will promise to be the first among Hardwaremen to hang a sign within my front doors, reading: "We do no Programme Advertising."—*The Iron Age.*

H. C. Wilhelm has sold out his interest in the Webber Hardware Company, La Porte, Ind., wholesale and retail Hardware, Stoves and Tinware. The firm advise us that they are reducing their line to a first-class retail stock, and will retire from business as soon as they obtain a purchaser for it.

Morrill's New No. 1 Saw Set Perfected.

Charles Morrill, 35 Warren street, New York, is putting on the market the Perfected No. 1 saw set, as here shown. The following directions given for use indicate the special features of its construction: "Hold the saw on any level place, teeth upward. Place the set on the saw. The anvil is movable up and down, so as to



Morrill's New No. 1 Saw Set Perfected.

regulate the distance the operator desires to set his saw teeth down from their points. The knurled screw fastens the anvil in any desired position. The rest screw when moved forward increases the amount of set; moved backward decreases it; by compressing the handles the plunger goes forward, and takes effect on the tooth of saw and presses it into place. Do not set the saw too wide; just enough to clear. It will then work easy, and run straight."

Shepard New Swivel Vise.

The vises shown in the accompanying cuts are put on the market by the Prentiss Vise Company, 44 Barclay

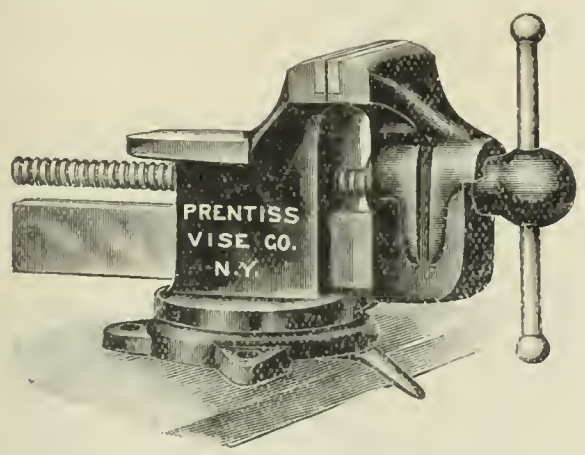


Fig. 1.—Shepard New Swivel Vise.

street, New York. The vises are gotten up as cheap goods, but care is taken in finishing and packing them so as to make them attractive. They have wrought steel

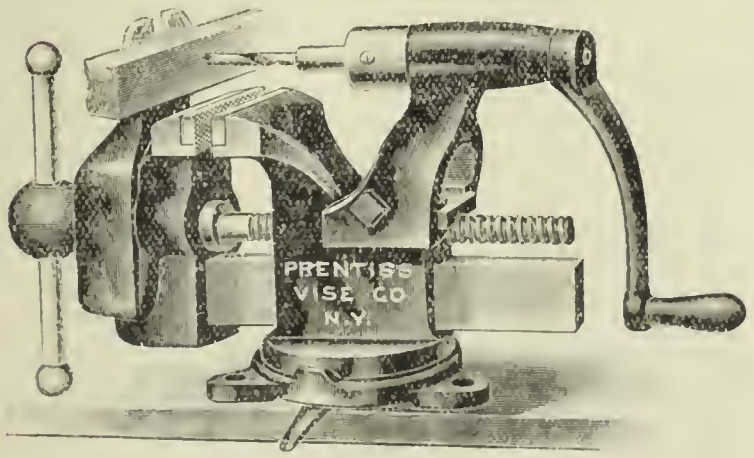

Fig. 2.—Hand Drill Attachments on Shepard Vise.

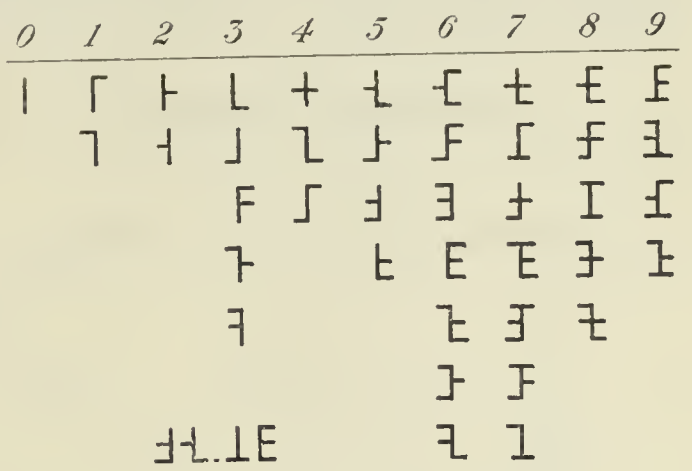
sliding bars, screws, levers and jaws. The anvils are trued off and polished. One of the features is the swivel bottom, which is all on top of the work bench. By moving the lever a cam is operated and the vise is held in position. In addition to the lever and cam, the periphery of the base is notched, with a tooth or projection on the revolving part of the vise which engages in the notches when the cam is applied. The notches and tooth are not shown in the cut. In Fig. 2 the vise is shown with the Handy drill attachments. The piece against which the work is placed to be drilled is slid down in the grooves, one of which is on each side of the front jaw, which holds it rigidly in place, as shown in Fig. 1. The work is fed to the drill by screwing up the vise. The part of the attachment which carries the drill slides over the anvil and is held firmly in place by tightening the bolt. The bolt has a handled nut, which obviates the use of a wrench in tightening the bolt. Both attachments can be put on or removed in a minute. The drill attachment is made to hold drills with shanks ½ inch in diameter.

A Connecticut Merchant's Suggestion.

The accompanying cost mark, though similar in general appearance to one we published some time since, is entirely different in make up, and is suggested by a Connecticut merchant. The principle upon



A Connecticut Merchant's Suggestion.

which the cost mark is constructed is that the dashes at the top of the perpendicular lines, on either side, count for one; those at the middle, on either side, count for two, while those at the bottom of the perpendicular lines, on either side, count for three. A perpendicular line alone represents 0. The mark at the bottom of the cut is given as an example showing how a cost mark may be written, in which the same figures are repeated while using different signs. The example, it will be seen, reads $55.66. An X or some similar sign can be used for repeat when found necessary.

MEMORANDA.

The Tinners' and Stove Dealers' Association of St. Louis, Mo., was organized Friday evening, November 26, with a membership of 75. G. A. Pauley was chosen president, M. Koch secretary, and H. W. Kratz treasurer.

H. M. Hillson & Co. send out a circular to the trade from Somerville, Mass., announcing that they have opened a salesroom and office at 134 North street, Boston, Mass., where they will keep in stock a full line of Tinware and Kitchen Furnishing Goods.

The 1898 price-list is the thirty-third annual publication of this sort issued by Frank L. Jones, Utica, N. Y. The goods noted in the circular include all sorts of apparatus, supplies and specialties for cheese factories, creameries and dairies. In addition to the price-lists, descriptive particulars are given and a few illustrations where necessary. The circular is printed on green paper and includes 20 pages.

C. E. Wilson, wholesale and retail Hardware, Stoves, Buggies, Wagons, &c., Henderson, N. C., has recently been increasing his facilities, and is now in much better position to handle his growing trade. Mr. Wilson's warehouse is 150 feet long and two stories high.

Reed & Ingvoldstad have succeeded Coombs & Ingvoldstad in the retail Hardware, Stove and Tinware business in Sergeant Bluffs, Iowa.

W. C. Grier, dealer in Hardware, Stoves, Tinware, &c., Milford, Mich., has been succeeded by F. B. Hatch.

Henry Mohr, Hardware merchant of Tacoma, Wash., has taken a prominent part in perfecting an organization of merchants in different lines in that city for the purpose of establishing a company to handle a stock composed exclusively of Klondike goods. A store has been secured, and is being fully stocked with groceries, dry goods, &c. Mr. Mohr will have charge of the Hardware department, including Sleds, Boats, Tents, Stoves, Tools and Cooking

Utensils. The combined stocks will, it is stated, represent a value of nearly $20,000. The outfitting establishment will open in January.

B. B. Stoops has admitted a partner in his Hardware busiuess in Summerville, Mo., and the firm style is now Stoops & Dwoody.

C. H. Heath has retired from the Hardware and plumbing firm of Heath & Byrne Brothers, Santa Cruz, Cal., and the style is now Byrne Brothers. The firm are now also occupying the floor over the store, and are introducing a skylight to secure better light.

Chas. Johnson is successor to Dalton & Gilfillan in the retail Hardware, Stove, Tinware and Agricultural Implement business in Blair, Wis.

George H. Crawford, Cornwall, N. Y., on account of ill health has disposed of his Hardware, Stove, Tinware, tinsmithing and jobbing business to C. H. Elliott, who will continue at the old stand. Mr. Elliott is a practical plumber of 15 years' experience, ten years of which have been spent in New York City.

A Water Purifying Plant.*

BY HOWARD STILLMAN, SACRAMENTO, CAL.

About a year ago the Southern Pacific Railroad Company established at Port Los Angeles, Cal., a plant or adjunct to the pumping statiou for the purpose of purifying the water supply at that point of the large amouut of scaling matter it coutained. The chemical principles involved are based on the well-known Clark or Porter-Clark process.

The mechanical appliance or adjunct to the pumping station was the author's design, and the purpose of this paper is to describe the method as well as the "standardizing" of the process, since the plant referred to was established with a view to rendering the same applicable to other stations ou the company's lines where the waters require purifying. The method which we are to discuss is intended to do away with an elaborate system of works and to furnish a continuous supply of purified water of constant quality without the use of agitators to assist chemical action or the necessity for labor other than that in usual attendance at a water station. It was also desired to do away with expert attention at remote points and avoid the danger of overdosing the supply, or going to the other extreme, with chemical solutions. The treatment of water in the cold on a large scale was considered the cheapest and best method of dealing with it. No two waters from a natural source are just alike, aud the treatment by boiler purges, compounds and nostrums, frequently exploited, is properly of value only in special cases.

The water at Port Los Angeles required a double treatment on account of the bicarbonate of lime contained, together with a large amount of the sulphates of lime and magnesia. The chemical principles involved in the treatment are not new, and it is not the purpose of this paper to discuss them at length, though reference will be made to them later, as well as the special character of the water treated.

DESCRIPTION OF THE APPLIANCE.

The general plan, Fig. 1, shows a sectional elevation and Figs. 5 and 6 a plan of the purifying addition and pumping station. As the system is independent of the action of the pump, except as a constant source of supply, that machine does not necessarily form part of our description. Referring to Fig. 1, the water main *a a* is intercepted in its passage from the pump to supply tanks, Fig. 2, by the circulating tanks Nos. 1 and 2. Detail of construction of these tanks is shown in Fig. 3. They are alike, each about 4½ feet in diameter by 8 feet high, and the space inside is divided up by partial diaphragms, alternately placed, allowing the water in its course to circulate upward, under and over, and check its motion, allowing time for chemical action to take place within them.

Their size is such as to allow the water about five minutes in passing through and the tanks serve virtually as an enlargement of the water main at that point. The arrangement of the diaphragm or baffle plates is not essential to the process, and the circulating tanks are not intended to deposit or dispose of sediment. The water main enters tank No. 1 at the bottom and discharges at the top, thence to bottom of No. 2, again discharging at top, and on to the supply and settling tank, Fig. 2.

Just before entering each of these circulating tanks the water main is tapped by a ½-inch pipe, conveying in a steady stream when in operation a solutiou of desired chemical reagent from the chemical tanks at *b, c*. These chemical tanks are shown in detail at Fig. 4, and the ½-inch feed pipes leading from them, *e, e*, are controlled by the plug cocks *f, f*. These smaller tanks are also of like dimension and hold 100 gallons when charged with solution, which suffices for four hours' continuous operation of the pump, or a supply of about 44,000 gallons of water. As shown in Fig. 4, the tanks are air tight when all cocks are closed, and are filled through the 1¼-inch pipe and screened funnel when the cock *g* is open. The top is tapped by a ¼-inch pipe leading from an air reservoir supplied with compressed air from an 8-inch Westinghouse pump. Just before entering the tanks the small air pipe

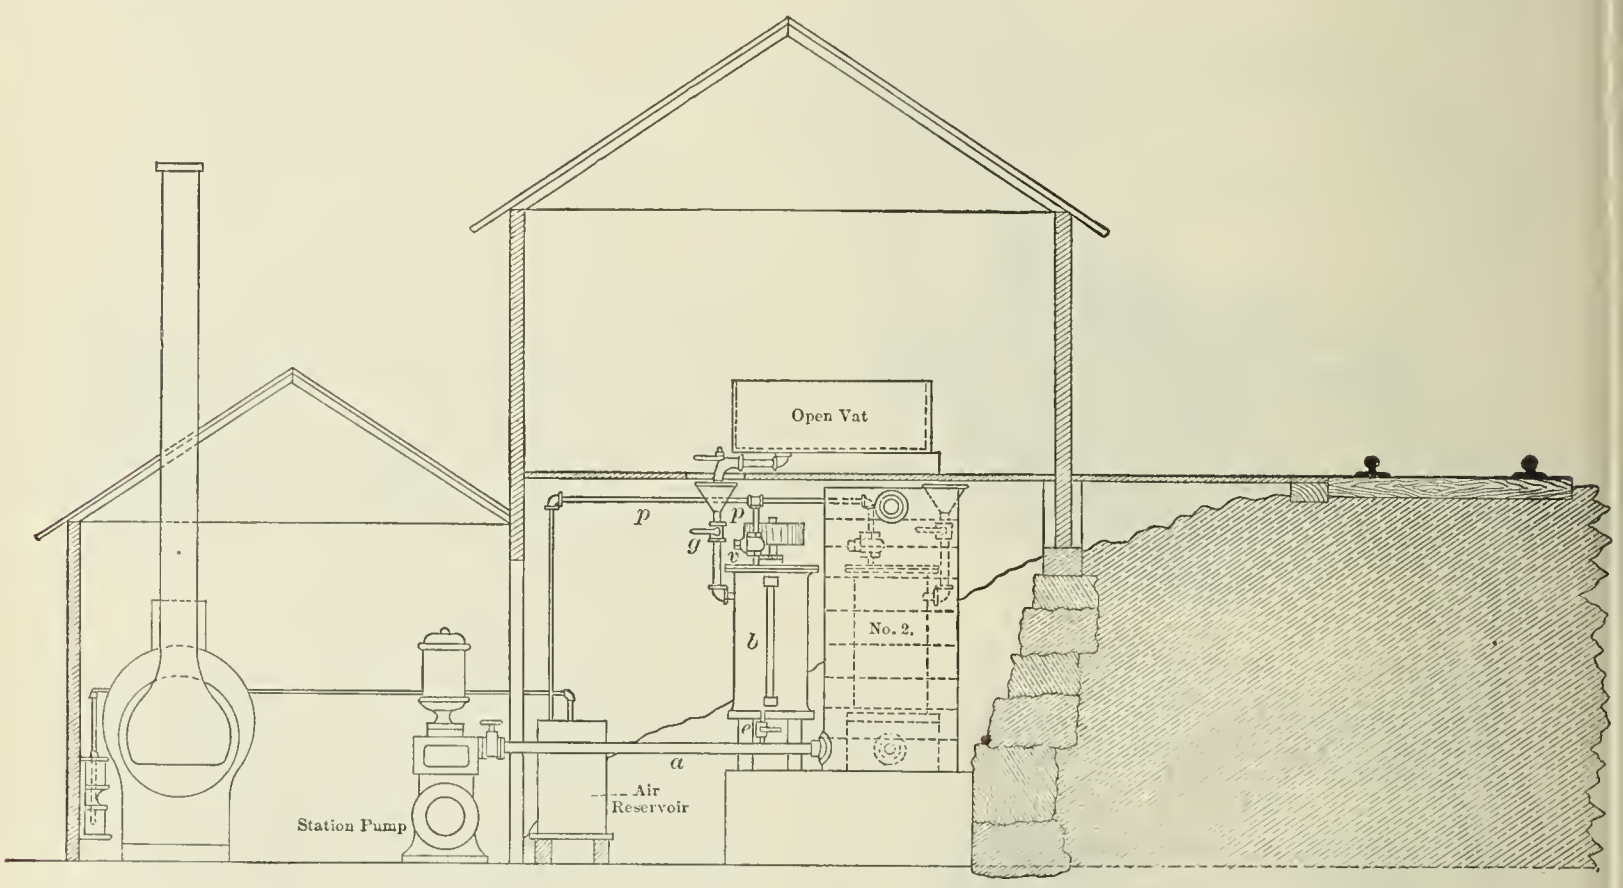


Fig. 1.—Sectional Elevation

A WATER PURIFYING PLANT.

* Paper presented at the New York meeting (December, 1897) of the American Society of Mechanical Engineers.

p is intercepted by a pressure regulating valve, *v*, whereby the air pressure within the chemical tanks is kept at a desired pressure, just overbalancing the hydraulic pressure in the water main aud allowing the solution to flow through the ½ inch feed pipe when the cocks *f* are open. These cocks are always operated wide open to prevent possible clogging up of the pipe by a casual obstruction, and the air pressure is allowed entirely to control the flow of solution to mingle with the water flowing through the circulating tanks to the reservoir. The pressure regulating valves are controlled in the usual manner by wrench and screw at bottom, so that the operator can occasioually adjust the feed of solution. Each chemical tank is about 4 feet high and provided with a long sight feed glass so that the contents can always be noted. They are gauged to feed out 11 inches per hour and when pressures are adjusted do not ordinarily vary. Occasional attention to the pressure valve during pumping hours, such as an engineer gives his sight feed lubricators to steam engine or pump, is sufficient, inasmuch as the hydraulic pressure during pumping hours does not vary more than the head varies in a gravity supply. It has been found that the air pressure on the chemical tanks is about an atmosphere less than hydraulic pressure in the main, so that, as would be expected, the pneumatic actiou is to hold back the solution from flowing out too fast. As referred to above, this

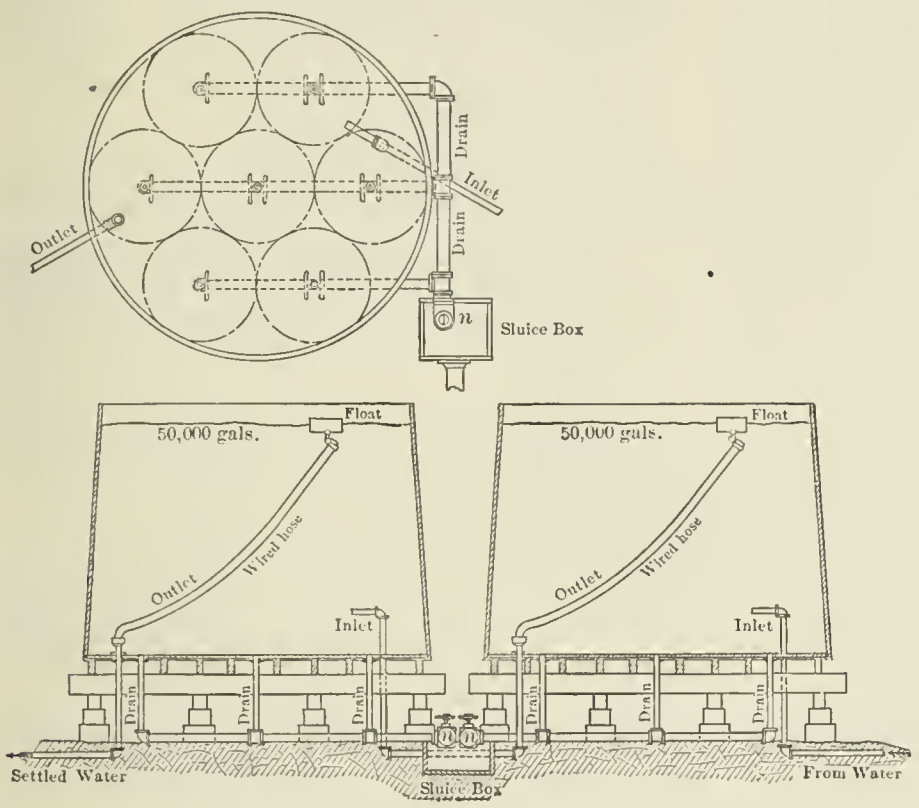

Fig 2.—Arrangement of Water Mains.

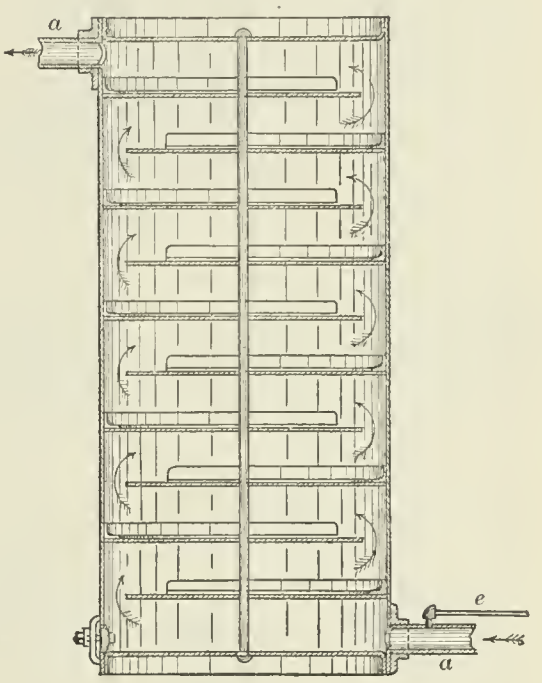

Fig 3.—Tank.

A WATER PURIFYING PLANT.

When slacked and mixed the liquid is a cream of lime, which is run off into the chemical tauk when desired, as before stated.

It requires about five minutes' time to refill the chemical tanks and recharge with air, at which time the water supply or pump is stopped. The tank charged with cream of lime is provided with an upright revolving shaft carrying paddles, as shown in Fig. 4, and worked through a stuffing box in the top by means of a small air motor. The paddles revolve slowly when the tank is feeding into the main, and their purpose serves to stir up the milk of lime to prevent it settling out, and thus deliver a constant amount of lime to the water being treated.

We have just considered the operation of introducing quicklime into the water in proper proportion to effect absorption of carbonic acid and consequent precipitation of carbonates in solution. The roily water now passes on through circulating tauk No. 1, and this part of the desired reaction occurs more or less completely. As referred to before, the water supply at Port Los Angeles contains, besides the carbonates in solution, a large amount of sulphaes. lime and magnesia. These salts not being converted by quicklime require a second reaction. The use of the necessary amount of caustic soda to effect this would have been expensive, besides other objections to its use. Soda ash was good and cheap, but would react with the lime directly to form carbonate of lime if introduced with it ; hence its use necessitated the second chemical tank, with its mixing vat, which is operated by the same method and simultaneously with the lime tank.

In this connection it may be stated that if the cream of lime and carbonate of soda were injected into the supply main from the same chemical tank, or in mixture, a series of chemical reactions would be set up which would theoretically terminate in the desired result, but, as stated, there would be a large amount of chalk formed directly, and there are other reasons why it seemed best to keep the reagents separate and make of it a double continuous process.

The soda tank is like Fig. 4, except that it requires no stirring device, as the solution is some distance from saturation and does not settle out. The weight of soda ash put into the soda mixing vat is dependent on same data as before. The amount required to convert the sulphates being 2 2 10 pounds per 1000 gallons, we have 4 × 11 × 2 2-10, or 96 pounds, to be dissolved in water to 12 inches in depth in the mixing vat. The lime is prepared by placing the stated weight of a good commercial article, fresh burned preferred, in the vat and letting in from an adjacent hydrant enough water to slack, after which more water is added to the required 12-inch depth. The soda is prepared in its vat in the same manner, except that it is simply a matter of solution, which is quite strong yet not saturated, hence no separation or crystallization of sal soda occurs in the chemical tank.

As the water in the main receives its second injection

feed could have been regulated from the cock *e*, or the pipe made smaller, but it was desired that at no time should the operation "hang fire" by clogging of a small opening. When the pumping ceases the cocks *e* in feed pipes are immediately closed, and when again pumping is renewed the cocks are opened. At Port Los Angeles the hydraulic pressure is about 92 pounds gauge and the discharge of the pump a little over 11,000 gallons an hour.

CHEMICAL TANKS.

The chemical tanks are filled as required from the mixing vats on the floor directly overhead, which is on a level with the track, as shown in Fig. 1. These vats are open and have 1¼-inch pipe connection at bottom, terminating iu plug cocks opening downward through holes in the floor directly into the screened chemical tank funnels, for convenience in filling. The vats are rectangular in form and of such size that a 12-inch depth of liquid fills a chemical tank for four hours' continuous run of pump. The weight of chemical material per 12-inch depth of liquid in the open vat gives a standard solution and is based on the quality of the water and its hourly rate of flow through the main to the reservoir, which data give the key to the situation, as, for instance, supposing analysis and tests of the water show that it will require 1 64-100 pounds of mslacked lime to absorb the carbonic acid in 1000 gallons. The flow through the main being 11,000 gallons per hour and the charge to last four hours, then we have 4 × 11 × 1 64-100, or 72 pounds, of lime to be slacked with water to a depth of 12 inches, 100 gallons, in the mixing vat.

from the soda tank, it passes on through the circulating tank No. 2, where the carbonate of soda effects its reaction more or less completely, and thence on to the storage and settling tanks, which are large enough to contain at least 24 hours' supply. The treated water is milky with precipitated carbonates, and discharges through the inlet pipe about 4 feet from the tank bottom. The outlet to this tank is a piece of 4-inch wired hose, the open end of which attaches to a float on the surface, as shown in Fig. 2. By this means the clearest water in this tank passes on to the second similar tank by the same method. Clear water is always obtained from the surface outlet of the second tank.

The chalk deposit is considerable at the bottom of the settling tanks and has to be drawn off occasionally, which is effected by the "spider drain" system shown in Fig. 2, which consists in tapping the tank bottom with seven 4-inch drain pipes. The location of these drains is shown

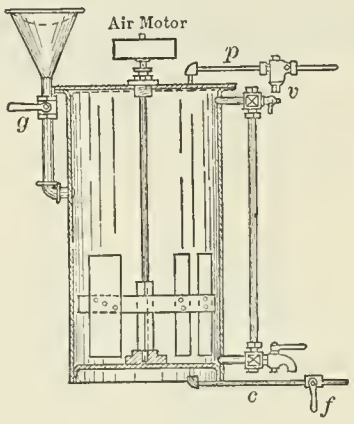

Fig. 4—Chemical Tank.

supply coming from the tank furthest from the water station. This, however, is a matter of circumstance and expense, dependent on local conditions.

RESULTS.

The following analyses are shown of the Port Los Angeles water supply in tabulated form "before" and "after" treatment. The analysis "before" is one of several which were made at intervals during a year previous to putting in the treating system. None of these analyses varied materially with the season. The analysis "after" was made about two months after the system went into operation, and is also one of several made during the past year without showing material variation in the treated supply.

Source of Supply, Well in Bed of Santa Monica Cañon, about 100 Yards from Pacific Ocean Beach.

Treatment per 1,000 Gallons. Contained in the water in solution in grains per U. S. gallon:	Date of Analysis. Before. March, 1896.	After. December, 1896. Lime, $1\frac{64}{100}$ pounds. Soda ash, $2\frac{2}{10}$ pounds.
Carbonate lime	14.29	0.69
Sulphate lime	5.07	0.29
Carbonate magnesia	1.22	7.15
Sulphate magnesia	17.15	1.63
Silica	1.34	0.11
Alumina	0.17	0.17
Sulphate soda	3.56	27.92
Chloride soda	8.75	5.71
Total	51.55	43.67
Incrustating matter	39.24	10.04
Non-incrustating matter	12.31	33.63

Cost per 1,000 gallons to treat, 4 cents.

The above analyses are presented as showing in a commercial way the result of the treatment. The treated

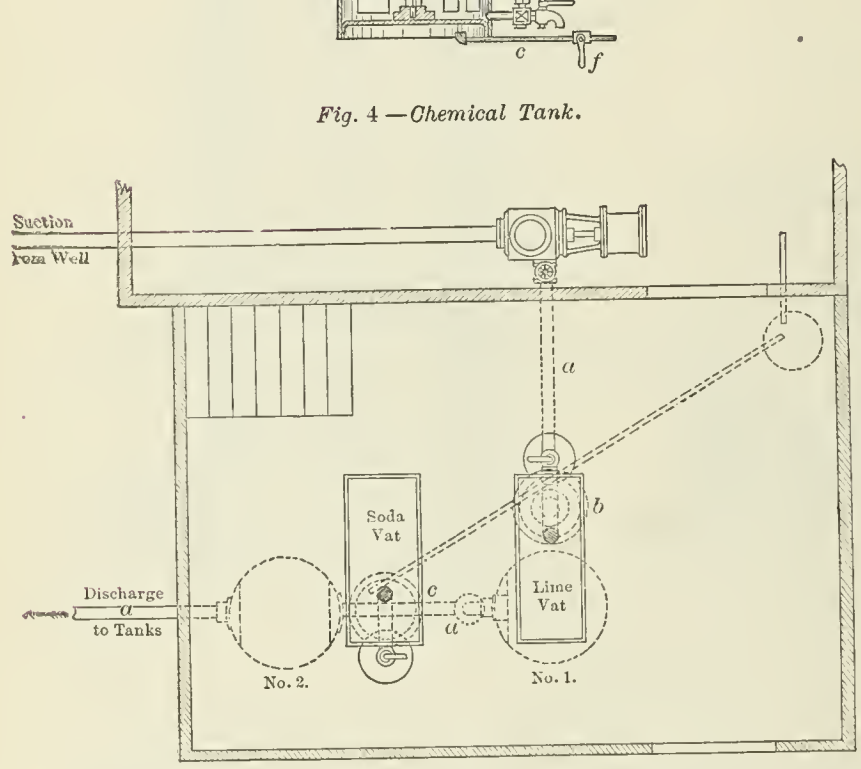

Fig 5.

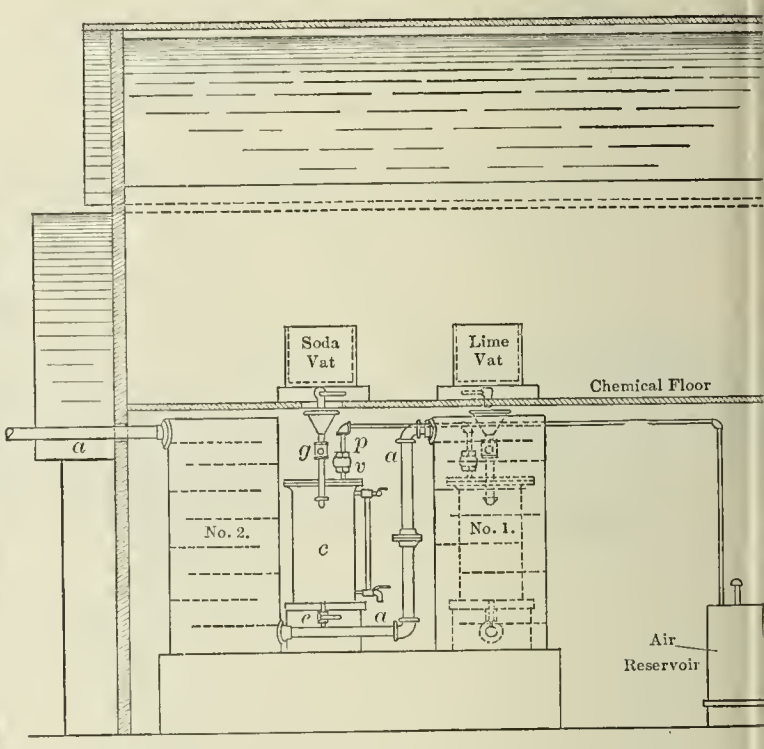

Fig. 6.

Views Showing Tank Arrangement

A WATER PURIFYING PLANT.

in the plan of one of the tanks, Fig. 2, the drainage areas being indicated by the tangent dotted circles.

The vertical 4-inch drain pipes open into larger horizontal pipes, and these into a 9-inch pipe at right angles, terminating in the sludge valve shown at *n*, Fig. 2. This valve discharges downward into the sluice box, and when opened the tank bottom is drained from seven equi-distant openings, which keeps the chalk deposit down near the tank bottom and prevents the "angle of slope" which the deposit would assume with but a single central discharge, whereby the deposit would accumulate up along the sides of the tank to interfere with clear settling, and would also require an occasional scraping or shoveling out. Each of the tanks is provided, independently, with this spider drain arrangement, though both sludge valves discharge into the same sluice box.

While for practical purposes it has been determined that sufficient tankage for a day's supply is ample to insure settled water, the system can be used by putting up a number of smaller tanks with less total capacity than a day's supply, provided the surface water from each tank drains to the lower part of the next and so on, the final sample was taken from the supply pipe at the end of the company's wharf, about 1¼ miles from the settling tanks, which are placed on top of a bluff across the cañon and about 160 feet above the track.

Returning to a discussion of the treated analysis: There is shown to be 7.15 grains per gallon carbonate of magnesia remaining in solution. Its presence seems due to the fact that the well water contained more carbonic acid than allowed for as in combination with carbonate of lime, hence the carbonate of soda in its reaction with the sulphate of magnesia produced in part the soluble bicarbonate of magnesia. It was found subsequently that an increase in amount of quicklime from 1 64-100 to 2 pounds per 1000 gallons reduced the carbonate of magnesia to about 3 grains per gallon, without an excess of lime showing in the treated water.

The analysis shows almost 28 grains of the neutral sulphate of soda. This alkali is not desirable, as having a tendency to produce foaming if allowed to become too concentrated in the boiler, but is neutral in other ways as affecting water for boiler use. Its presence is unavoidable, as being the direct product of soda ash and magnesia

sulphate, $Na_2CO_3 + MgSO_4 = MgCO_3 + Na_2SO_4$. The greater portion of the $MgCO_3$ is precipitated, but the soluble Na_2SO_4 necessarily remains, and like other alkali salts can only be removed from a water by evaporation.

While the treated water is not shown to be "purified" in the proper sense of the term, yet it is converted to a fairly good water for boiler use. Previous to treatment the water formed a large amount of very hard scale, with considerable corrosion. I have seen pieces of this scale 1½ inches thick and weighing over a pound, which could be best pulverized on an anvil. Analysis of this scale showed it to contain very much more of the hardening element, sulphate of lime, than was due to the amount of that element existing in the water before use; hence it seemed most probable that superheating of fire box plates to force heat through the intervening scale to make steam led to decomposition of the sulphate of magnesia, forming, with the carbonate of lime, more sulphate of lime and carbonate of magnesia. The superheating of the plates from the cause stated would possibly lead to decomposition of a film of water next to them and account for the corrosion, as oxidation under these circumstances would seem bound to occur ultimately.

A switch engine with clean boiler was put to work on the wharf at Port Los Angeles, using only treated water, not long after the plant was put in operation, and observations made at intervals on the action of the water. No scale forms from its use, but a small deposit of magnesia sludge, having no tendency to form scale, has at times been observed. Otherwise the treatment has greatly improved the quality of the supply.

TRADE NOTES.

The Standard Aluminum Reduction Company of St. Louis, Mo., have been incorporated under the laws of West Virginia, with a capital stock, registered in St. Louis, of $20,000.

W. I. Jones & Co., manufacturers of Tin Cans, are about to move their business from Roanoke, Va., to Wilmington, N. C.

David Morrison's Brass Works, 55 West Sixteenth street, New York, were damaged by fire on December 6. The loss is reported to be fully covered by insurance.

The Old Meadow Rolling Mill Company of Scottdale, Pa., were incorporated at Harrisburg, Pa., on December 6, to manufacture Sheet Iron and Steel, with a capital of $125,000. The directors are H. F. McCann, James A. Bennett, Greensburg; John W. Ruth, John S. Parker, M. A. McCoombs, A. C. Overholt, A. L. Keister, Scottdale.

The Sleeper Machine Company, 35 Congress street, Boston, Mass., manufacturers of Can Making Machinery, issue an illustrated folder describing their special Lock Seaming Machine and their Lock Seaming and Soldering Combination Machine. The first named device is peculiarly adapted for the manufacture of all cans where no soldering is desired, and is capable of seaming 40 to 60 can bodies per minute according to the size of the can. The capacity of the Combination Machine is 35 can bodies a minute. The company make also Lap Seamers, Heading Machines and Rolling Mills.

It is reported that the sheet mills of the Corning Steel Company, at Hammond, Ind., are being repaired and put in readiness to resume operations. They were last operated under lease by the Illinois Steel Company.

The reported fire loss on the Elmira Brass & Iron Works of I. B. Coleman, Elmira, N. Y., was greatly exaggerated, and was fully covered by insurance. We learn officially that the foundry was not injured, that the proprietor has moved into a more commodious shop and is in better shape for buisness. Full time with full force is expected to be made about as we go to press.

The Dallas *News* reports that arrangements have been made for the manufacture of Metal Tanks at Corsicana, Texas.

The Enterprise Enameling Company are erecting a new plant at Bellaire, Ohio. It will be located on the site formerly occupied by the Enterprise Glass Company.

Arrangements have been perfected for a novel exhibit at the Trans-Mississippi Exposition, at Omaha, Neb., next spring. The citizens of the State of Kansas propose to collect all the mortgages canceled in that State during the past year and forward them to Omaha, to be placed in display in one huge pile as an evidence of the fact that Kansas is practically free from debt. It is calculated that the canceled Kansas mortgages will probably fill a freight car.

Photographs Without Light.

In a recent paper read by Dr. Russell before the Royal Society he described the results of a series of experiments which, to photographers, almost rival the discovery of the X-rays. From time to time, says the "Journal" of the Franklin Institute, various experimenters have claimed to obtain photographs by the long exposnre of bodies to sensitive photographic surfaces withont the action of light. As far as we are aware, however, with the exception of Becquerel's and Colson's experiments, the precautions taken for the exclusion of extraneous light have not been such as to place these experiments above suspicion.

There now seems little room for doubt that many of the common substances with which we are surrounded have the property of emitting invisible active radiations, which can pass through many bodies that we have been in the habit of regarding as opaque. Becquerel some time ago showed that different compounds of uranium, if allowed to remain on a sensitive photographic plate for some days in the dark, had considerable action on the film, and if the plate was developed in the usual way a photograph of the body was obtained.

Dr. Russell, in repeating Becquerel's experiments, has discovered that this particular action is by no means confined to uranium salts, but that many of the metals and other bodies, such as wood, charcoal, copal, straw, &c., possess it in a marked degree. The radiations from these bodies, however, differ in one very important particular from those given out by the uranium compounds. While the latter readily pass through glass, the former are completely stopped by it. Mr. Colson, in January last, described the action of zinc, cadmium and magnesium on photographic films in the dark. At the time of making his experiments Dr. Russell was not aware of this, and consequently his results are independently confirmed.

Starting with the metals, mercury, zinc, magnesium, cadmium, nickel, aluminum, pewter, fusible metal, lead, bismuth, tin, cobalt and antimony, he found that all these, after a week's exposure near a sensitive plate in the dark, produced a distinct effect upon the plate, while gold, iron and copper only showed a very slight effect. The action is not in any way due to "contact phenomena," as a polished surface of zinc with a design scratched on it gave a distinct image of the markings when not touching the plate, and even when thin screens of gutta percha or celluloid were interposed between the sensitive plate and the zinc surface. Some metals were then coated with copal varnish, to see if this would interfere with the effect. It was found that the image was more rather than less distinct.

In another set of experiments, cardboard pill boxes were used for inclosing certain substances before allowing them to act upon the photographic plate. It was discovered that an empty box emitted active radiations, giving a most distinct image. This suggested experiments with different cardboards, when it was found that the better qualities were quite inactive, while the common varieties, known as straw board, had considerable action on the plates. Among the other bodies experimented with were green and dry woods, both of which were active. A section from a young larch tree gave an excellent image, showing rings and layer of bark. Charcoal was also found to be active, but lost its activity if heated for several hours in a closed crucible.

The results obtained with printers' ink were very interesting. In many cases they prodnced no action at all, and in other cases they were remarkably active. The ink used by the *Westminster Gazette*, the *Standard* and the *Daily Graphic* gave excellent pictures of the printing. The *Times* showed not quite such good results, while ink of the *Morning Post* and the *Eeho* had no action at all.

What is this mysterious force? Its nature has still to be discovered. Two points seem to have been established. The first is that an increase of the temperature of the body greatly increases its activity; the second, that aqueous vapor in no way assists the action. Bodies which at 0 degree C. had no action whatever, at 70 degrees C. gave distinct images. It has further been suggested that the chemical action is caused by a finely attenuated vapor given out by the different metals and other bodies. It is far more likely to be due to some hidden form of energy more or less akin to what has been paradoxically, but suggestively, called dark light.

Factory Inspector Campbell of Pennsylvania estimates that there are 150,000 more people at work in the factories of that State now than were employed in them a year ago.

A dispatch from Cripple Creek, Col., reports that the northern boundary of the Cripple Creek gold district has been extended three miles by the discovery on Copper Mountain of a large blanket vein of ore running from $10 to $1500 per ton in gold. The gold is said to lie quite near the surface.

STOVE TRADE NOTES.

John M. Graff.

The stove trade has lost another of its veteran members by the death of John Milton Graff of the firm of Graff & Co., 208 Water street, New York City, which occurred at his home, 118 St. James place, Brooklyn, N. Y., on Saturday, December 4. The immediate cause of his death was Bright's disease, complicated with heart trouble. Some two years ago Mr. Graff had a serious illness from which he never seemed to fully recover, and for more than a year he has been able to give only irregular attention to his business affairs. He was born in Spencertown, N. Y., December 21, 1835, where he spent his early manhood. It was also here that he learned the trade of tinsmith and stovemaking and engaged in the retail business under the firm name of Graff & Rossman. He left Hudson about 1870 and went to Troy, where he engaged in the manufacture of stoves with two associates, under the style of Shavor, Henderson & Graff. It was while a member of this firm that they brought out the Lively Times parlor stoves, with which the older members of the trade are, doubtless, familiar. Mr. Graff, however, continued in Troy for only a short time, when he came to New York and was admitted as a partner to the firm of Burtis & Rice, which then became Burtis, Graff & Rice. These associations were maintained for a few years until Mr. Rice retired, when the business was conducted under the firm name of Burtis & Graff. This arrangement continued until 1876 or 1877, when, owing to the general condition of business, the firm became financially embarrassed and Mr. Burtis retired from the field. Upon what may be said to have been the ruins of that business, Mr. Graff, in 1878, associated with him W. M. Seymour, and they started operations under the style of Graff & Co. Mr. Graff, whose portrait we present herewith, was of a rather retiring disposition, but was held in high esteem by all with whom he came in contact, either in a social or business way. He leaves a widow, a son and two daughters.

JOHN M. GRAFF.

In announcing the death of Mr. Graff the company state that the business will be continued without any interruption and under the same name by the surviving partners, William M. Seymour and John H. Forshew, together with the Estate of John M. Graff.

Solomon S. Detwiler.

In the death of Solomon S. Detwiler, which occurred in New York City on Sunday, December 5, Columbia, Pa., has lost an honored citizen and the Keeley Stove Company a valuable officer. For some time past Mr. Detwiler had been in poor health, and it was with a view to improving his condition that a little more than a month ago, accompanied by his family, he came to New York for medical treatment. The hoped for improvement and relief, however, were not realized, and he gradually became weaker until Sunday forenoon, when he gradually passed away.

Mr. Detwiler, the youngest son of Joseph and Susannah Detwiler, was born in the old homestead just west of Wrightsville, on October 28, 1833. He spent his boyhood on the farm and was educated in the local country schoolhouse and in Mount Joy Academy. He then removed to Columbia, entering the hardware store of Jonas Rumple, where he continued until July 3, 1860, when, with his brother, Daniel H., he engaged in a private banking business under the style of Detwiler & Brother. In the same year he purchased the property at the corner of Second and Locust streets, establishing the banking business in the room in which the First National Bank is now located, and occupying the dwelling portion of the building as a home, having been married that year to Miss Mary C. Redsecker. The firm continued in the banking business until 1864, when they were succeeded by the First National Bank, which was organized with a capital stock of $100,000, Mr. Detwiler becoming cashier, a position he filled uninterruptedly for more than 33 years. During this time he engaged in numerous enterprises, and in the last 20 years especially took a prominent part in the rapid growth of Columbia and its industrial development. He helped to organize, manage and direct the Keeley Stove Company, of which at the time of his death he was the president and a director; he promoted the organization of the Columbia Iron Company, was foremost in securing for Columbia the lace and silk mills, and contributed largely to the securing and organization of the Grey Iron Company, being one of their directors. Another result of his work was the East Columbia Land Company and the beautiful suburb which they created, his last enterprise being the Columbia Banking Company, of which he was director and treasurer.

Mr. Detwiler was a man of great energy and ceaseless activity, and his interests extended over a wide range. He manifested great interest in municipal affairs, serving in the Borough Council for six years, and was its president in 1872-3. He was a member of the committees which erected the Market House in 1868 and the Opera House in 1873. He was also interested in the electric railway system, was prominent in the negotiations which ended in retaining the Pennsylvania Railroad Company's roundhouse at Columbia, and helped to promote the removal of the brush factory to East Columbia.

Mr. Detwiler's body was taken to Columbia Monday evening, and the funeral services were held at 2 p.m. on Thursday afternoon. In an announcement of the death of Mr. Detwiler, signed by W. D. Snyder, general manager, and J. E. Shomier, secretary of the Keeley Stove Company, is found the following paragraph:

The success of this company was largely due to his tireless efforts and remarkable energies. Its present pros-

perous condition is the best testimonial we can offer to his personal and official devotion to its interests. While yet in love with life, and raptured with the world, he passed to silence and pathetic dust. Brave and tender, in every storm of life he was oak and rock; bnt in sunshine he was vine and bloom. He sided with the weak, the poor and the wronged. With loyal heart and with honest hands he faithfully discharged all public trusts. He added to the sum of human joy, and were every one for whom he did some loving service to bring a blossm to his grave, he would sleep to-night beneath a wilderness of flowers.

Eighty-sixth Birthday of James S. Lithgow.

The stove trade of the country numbers among its members many veterans, but it is probable that there are few older than James S. Lithgow, once Mayor of Louisville, and one of her most respected citizens, who celebrated his eighty-sixth birthday on Monday, November 29. While there were no special ceremonies at his home, many of his old friends called to pay their respects and congratulate him upon his long life and good health. Mr. Lithgow was born in Pittsburgh in 1812, and went to Louisville December 13, 1832, where he has since resided, having held numerous public offices and positions of trust in religious and financial circles. He has always taken an active interest in politics, but has never been a seeker for public office. He has been called upon time and again to serve in both boards of the General Council at different times, and was Mayor of Louisville in 1866 and 1867, but. as he recently expressed it, he always got out as soon as he could. When Mr. Lithgow first went to Louisville he worked as a journeyman, having learned his trade between 1826 and the time of his going to that city. In August, 1836, he was called home by the death of his mother. He had no brothers or sisters, and his father had died when he was but nine months old. He was planning with a shopmate a trip around the world, and proposed starting at an early date. While they were discussing their plans one day, and figuring how they could make both ends meet, see the world and at the same time make a living, a man came to him and said that a friend wanted to see him over on Main street. He went and was confronted with a statement that it was his desire that he should go into partnership with a young man named Wallace, but Mr. Lithgow said that he had no money and that such a thing was entirely out of the question. Nevertheless he signed a co-partnership agreement with Mr. Wallace, and that afternoon they began to look for a suitable location. They found a new store on Market street, just east of Third street, and while Mr. Wallace looked after the purchase of tools and necessary machinery, Mr. Lithgow looked after the store, and on December 3 the new firm were doing business, and they were successful from the start. In 1843 they started a foundry on Water street, between Second and Third, for the manufacture of stoves. They turned out the first coal stoves that ever were made in that city, and subsequently built two warehouses on Second street. The periodic rises of the river caused considerable inconvenience, and in 1856 the firm built their present foundry at Hancock and Main streets. Mr. Wallace died in 1861, and in 1874 Mr. Lithgow formed a corporation under the style of Jas. S. Lithgow & Co., taking in his sons-in-law, Mr. Smyser and Mr. Smith, and others. This company have always held a prominent position. Mr. Lithgow seldom fails to go to the office every day, and continues a general supervision of the immense plant. Mr. Lithgow has five daughters living and has more than 20 grandchildren. His wife died in 1891.

Good Trade in Chicago.—The Chicago stove houses report a surprisingly good demand for December. It had been expected that business would practically cease with the advent of the closing month of the year. This had been the experience of previous years, but 1897 maintains its perversity to the end, and sales are made when dullness is expected, just as earlier in the season it was dull when there should have been a brisk demand. However, nobody is complaining of this new turn of affairs, and it is to be presumed that nobody will complain even if he is too busy to go out to select Christmas presents for his family and friends.

The trade will be interested in learning that F. Pickering of Sandusky, Ohio, who has traveled for many of the leading foundries of the country during the past 25 years, will during 1898 cover Western and Northern Ohio and Indiana in the interests of the Bellaire Stove Company of Bellaire, Ohio. E. R. Reed will continue to call upon the trade in his usual territory in the interests of this concern, while R. C. Montgomery will look after their business in Eastern Ohio and Western Pennsylvania.

ODD PLATES.

The Champion Steel Range Company of Cleveland, Ohio, report a good demand for their Marquart Steel Range, and say that the sales of it are 50 per cent. larger than last season.

Col. Isaac D. Smead, formerly president and superintendent of the Smead Furnace & Foundry Company, at Toledo, Ohio, has severed his connection with that concern. We understand that this step has been taken in order that he may give his entire attention to the business of a recently organized company who will manufacture Garbage Crematories under his patents. The business of the Smead Furnace & Foundry Company will be continued under the general snpervision of Mr. Dowd.

We have received from Schellhammer & Sons, Warren, Pa., a circular of their Pennsylvania Gas Furnace which gives half-tone engravings of a church and a residence which are heated by their Gas Furnace. In one instance it is stated that a residence of 12 rooms and a hall is heated with gas at an expense of but $8 a month in the coldest weather and a less expenditure in the milder months. The Furnaces, made in different sizes and prices, are shown in the circular.

The California Stove & Iron Works of Oakland, Cal. which were incorporated two years ago last August, have been meeting with a good demand for their products, and the growth of the business has been such that it has been found necessary to enlarge their plant. For nearly a month past operations have been going on night and day on orders from Honolulu and other points. Their well-known California Range is in good demand, and was awarded a gold medal in the exhibitions of 1895-96 and 1897. Several hundred of their ranges are in use in Oakland, Berkeley and Alameda, and the company are at work on some new Stoves, which will probably be put on the market within the next 30 days.

Articles of incorporation were filed with the Secretary of State of Kentucky on Friday, November 26, by Bridgeford & Co. of Louisville, the articles being filed by C. W. Adams, C. H. Shields and A. L. Adams. The capital stock is fixed at $75,000, with the privilege of increasing to $150,000, and the indebtedness to which the corporation may subject itself is $20,000. The incorporators named above are to constitute the first Board of Directors.

Isaac A. Sheppard & Co., Philadelphia, Pa., put Eclipse Covers on their Excelsior Ranges. It gives the dealer a good, strong "talking point," one that the housewife grasps at the outstart. The Eclipse Cover, which is the kind that lifts at the center of gravity, is supplied free with the Excelsior Ranges.

George H. Barbour of the Michigan Stove Company, Detroit, is the subject of some pleasant remarks in the Sunday issue of one of the local papers, the article being accompanied by an excellent likeness of this well-known Stove man. Mr. Barbour is prominent in local affairs both in a business way and socially, and is highly regarded by all who know him.

Buck's Stove & Range Company, St. Louis, advise us that upon the recommendation of a committee of special judges, and with the approval of the Committee of Award they have been awarded a diploma of excellence, with silver medal, for the most complete display of Steel Ranges at the Tennessee Centennial Exposition, which was recently held in Nashville, Tenn. The display consisted almost entirely of Steel Ranges, and the award of merit is particularly gratifying to the Buck's Stove & Range Company in view of the number of manufactnrers who made displays of a similar character. This company commenced the manufacture of Steel Ranges some four years since, and were one of the first stove foundries to engage in the manufacture of this line of goods. Anticipating that their action in this direction would be followed by other stove manufacturers, they determined to confine their ontput to a strictly high grade line of Steel Ranges, believing that the production of a low priced Range meant a cheap range both as to material and construction, and a consequent reflection on them as manufacturers of high grade goods. They have steadily adhered to this plan, and are to-day manufacturing a full and complete line of high grade Ranges, which, they advise us, are placed on the market at a moderate price.

The Somerset Stove Company, Somerset, Mass., of whom W. P. Hood is treasurer and manager, have issued a very pretty decorated poster calling attention to their new famous Somerset Pallas Range and Parlor Stoves for 1898. The Range is of attractive exterior, substantial in appearance, and is provided with the modern improvements. Among these features may be noted extra large oven, deep fire box, patent oven door opener, sheet iron ash pan with cast iron frame, large broiler door, double oven top and a drop door in the oven door; in other words, the name plate consists of a panel which can be

dropped in order to examine the contents of the oven. One of the features which will command the attention of the housewife is a thermometer in the name plate on the oven door, by means of which the temperature of the oven may be seen at a glance. The parlor heater is of the surface burning type, with cylindrical body, reversible flues, and other features essential to powerful heating.

The Detroit Furnace & Heater Company of Detroit, Mich., are now located in their new plant, the machinery having been started on December 1. The new plant is about three times the size of the old one, and no pains or expense has been spared to make it complete as regards equipment in every particular.

R. L. Morley, associate manager of the Michigan Stove Company, Chicago, has been called to his old home in England on a mournful errand. His father died recently, leaving his mother without any immediate relatives near her. Mr. Morley therefore determined to bring her to America. He left Chicago November 29, and expects to return January 2.

The Estate of P. D. Beckwith, Dowagiac, Mich., is going into the Furnace business quite extensively, but the report is incorrect that it proposes to bring out a Boiler for steam and hot water heating. This rumor doubtless arose from the fact that the estate has made a hot water attachment to go into the different sizes of furnaces, to be used where people wish hot air and water heating from the same Furnace. This is especially adapted to cases in which there is a room which from its location may be difficult to heat with warm air. Manager Fred. E. Lee says his Furnace trade this year has been extremely successful, and he feels that he has a Furnace in every respect worthy the name Round Oak. Another season its sales are to be pushed as hard as possible. Mr. Lee further reports a fine trade this year on Round Oak Stoves and Ranges and believes that trade will continue to improve.

Geo. M. Clark & Co., 72 to 76 Lake street, Chicago, have under way at their factory, at Harvey, Ill., a new oil and water gas plant for lighting and heating purposes, as well as for use in testing stoves, soldering, brazing, and other operations requiring or permitting of gas for fuel. The gas may also be used in the japanning ovens. The plant is to be in operation by the beginning of January.

The Bliss Dial Feed Presses.

The engravings here presented illustrate two new dial feed presses, built by the E. W. Bliss Company, 16 Adams street, Brooklyn. They are intended for the rapid production of brass goods, lamp burners, watch and clock case stampings, oil cups and similar goods. The straight sided machine, Fig. 1, is for much heavier work than the other. The slide of this press may be arranged to carry one, two or three punches, according to the nature of the work, so that a boy or girl can accomplish from 80 to 250 operations per minute by simply dropping the blank or shell to be reshaped, pierced or stamped into the holes of the dial as it moves along. The value of this great speed of production and facility of handling is enhanced by the entire absence of risk to the operator, who has no occasion whatever to put his hands between the punches and dies. The safety device shown at the right is so connected with the clutch as to stop the slide on its downward stroke before it can do any harm in case some accident should prevent the dial from assuming its correct position. The cam next to the frame actuates, by means of lever connections not visible in the cut, a knockout which pushes the articles out of the dies back into the dial holes to receive a second or third operation as they move along. As shown in the cut, the press is arranged for the second and third operations on watch case covers, as indicated in Fig. 3. The weight of the press complete is about 5000 pounds.

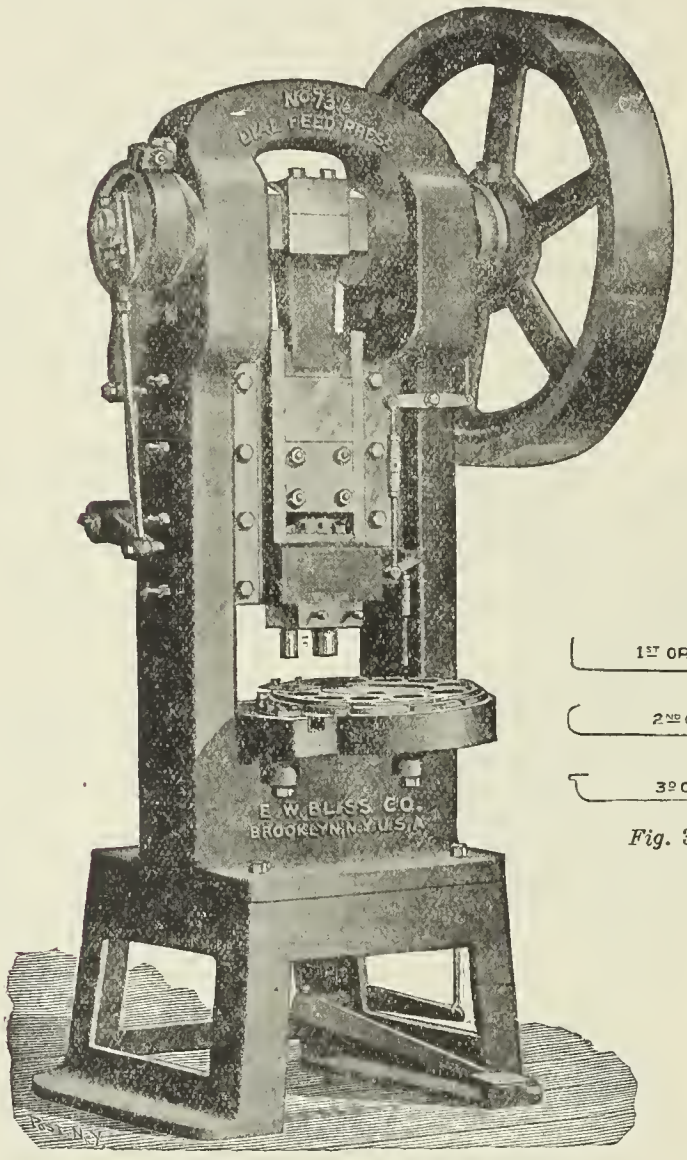

Fig. 1.

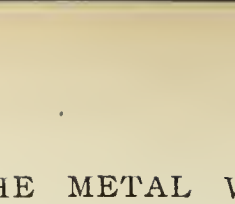

Fig. 3.

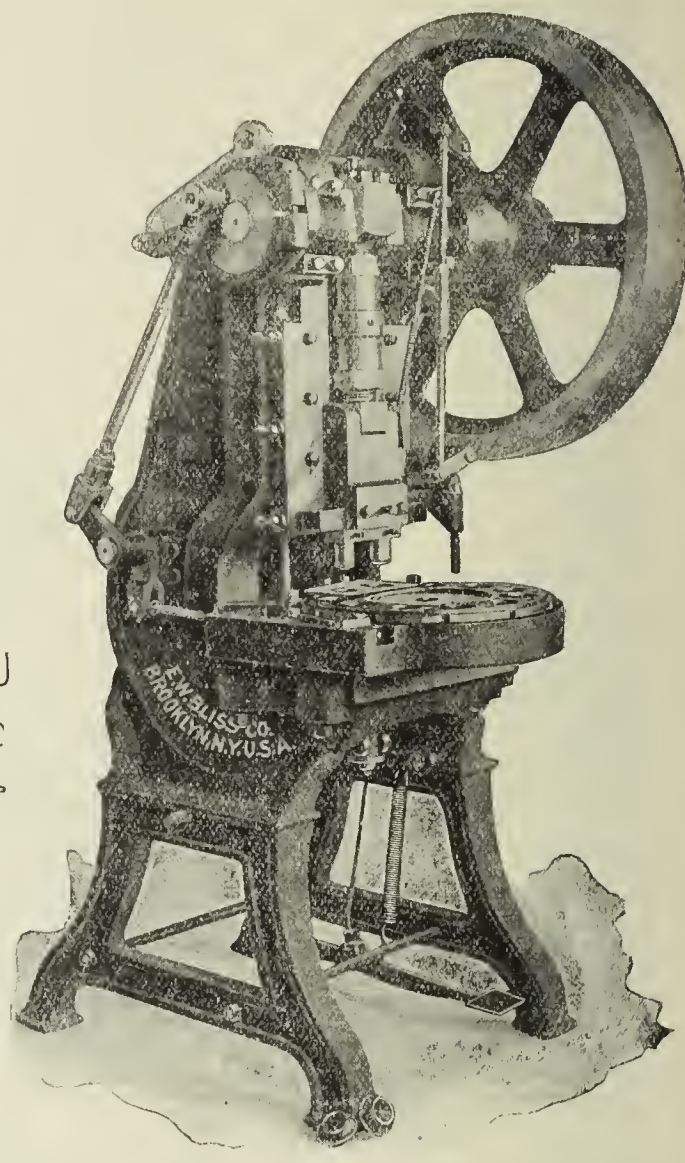

Fig. 2

THE BLISS DIAL FEED PRESSES

The press in Fig. 2 is identical with that in Fig. 1, so far as the dial feed and the mechanism for operating it go, but on account of its lighter and overhanging frame it is better adapted for work not requiring so great a pressure. The weight of this machine is about 2600 pounds, but feed attachments similar to those illustrated are also fitted to lighter presses.

Canadian News.

Ontario's Mineral Development.

In the speech from the throne at the opening of the session of the Ontario Legislature on Tuesday reference is made to the mining industry of the province, which is described as making steady progress. The area of crown lands sold and leased under the provisions of the mines act has been largely in excess of that of any recent year, and fresh proofs have been found of the richness of the northwestern part of the province, where exploration has been most extended. This reference in the speech was seized on both by the movers of the address in reply and by the opposition. The discovery and development of great areas of rich mineral land have had the effect of raising the Government's mining policy from a state of comparative insignificance into the very first rank among the issues of the day. There is now scarcely any subject more contentious. A very large number of settlers have been attracted to the Rainy River and Western Algoma districts, where there are now several gold mines in active production. Thus the district, formerly a wilderness, is becoming settled and is producing wealth. Being nearly all crown land property, the Ontario Government is directly connected with its prosperity, as it controls the sale of the property, the opening up of the country by railroads, the regulations to which mining is subject, and the revenue obtained from the royalties. For these reasons, and for the further reason that the potential wealth of these regions is generally believed to be enormous, the mining policy received almost the chief attention, if not of the Government, at all events of its critics. The mining law will be up for amendment, certain concessions of the Government will be canvassed, and aid will be asked for railways. One thing that has undoubtedly been helpful to the mining industry in western Ontario this year was the action of the Dominion Government in placing many of the articles of mining machinery on the free list.

Almost the whole value of the increased output of the current year—for which there are no figures yet obtainable—is to be credited to the gold mines. The iron mines have proved disappointing again. At the beginning of the year there was a good prospect that certain properties west and north of Port Arthur on Lake Superior would be extensively worked. Fine magnetite iron locations were taken up near Greenwater Lake in that locality, and a shaft had been sunk at a point north of Port Arthur, near Finmark Station, in the hematite iron deposits there. Though the ore is said to be rich, workable, easy of access and easily mined, the operations entered upon last spring have not been followed up. Again, on the north shore of Lake Huron, the bright prospects of last spring have not been realized. It was expected that the Hamilton Blast Furnace Company would draw their chief supplies of material from there. A considerable sum was wasted in exploration, which seems to have turned out rather fruitless. Recently the company have been operating near the mouth of the Spanish River, but though the ore there is reported to be good and plentiful, and at the same time easily obtainable, work has stopped, as it has been found that it was being carried on beyond the limits of the company's claim. Negotiations for the purchase of the lands adjoining their own have now been entered into by the company.

One influence which has no doubt helped to arrest the development of iron ore deposits on the shores of Lake Huron and Lake Superior was the change made last April in the provisions of the act authorizing the payment of a bounty on pig iron. The new arrangement increased the bounty by $1 per ton, and extended it to iron made wholly or partially from imported ore. The law as it now stands provides that the bounty shall be $3 per ton on the proportion of iron made from Canadian ore and $2 per ton on the proportion made from imported ore. This change, being more favorable to the use of imported ore, has had a tendency to cause an increase in the consumption of it, and to lessen the motives for the working of our own ore beds. The Hamilton furnace is now using American ore.

Nova Scotia Coal.

The decision of the Dominion Coal Company to close their Gowrie mines and Victoria mines in Cape Breton has roused strong protests from the residents of Port Morien and Victoria mines. They have appealed to the Government of Nova Scotia, as the company's charter is a provincial one. G. H. Murray, the provincial Premier, has sent a note to the president of the company protesting against such action. If the company's order goes into effect four collieries will be closed after the 15th inst. The reason alleged is that they have ceased to pay. From the Gowrie mines 150,000 tons were shipped last year.

During the season of navigation which has just closed the quantity of coal sent up the St. Lawrence from the collieries of Nova Scotia was 921,000 tons, 127,000 tons more than came up during the season of 1896. The greater part of this coal was delivered at Montreal, though 123,000 tons were unloaded at Quebec.

Kingston's Industries.

Kingston and Abbott & Co. have been unable to come to terms, and it looks as if the difference would not be bridged. Abbott & Co. insist that the bonus of $50,000 be paid in monthly installments, to cover the expense of transferring the rolling mills from Montreal and setting them up in Kingston. The Citizens' Committee—a joint committee of the Board of Trade and the City Council—are unwilling to agree to that arrangement, holding that the bonus should not be paid until the works are erected.

The Kingston Lead Works, which have been closed for years, are likely to be reopened. A purchaser has been found for them and for the old Frontenac lead ore lands, which belonged to the estate of the company who used to operate the works. Another lead ore mine near the Perth road is also to be secured, and ore is to be smelted at the works for the owner of a lead mine near Arnprior.

Trade Items.

The Grand Trunk Railway Company have received 500 new freight cars, each of 60,000 pounds capacity, for general use on their system. The cars were built by the Michigan Car Company of Detroit. Another lot of 500 are being built in the railway company's own shops in Canada.

A large bonus has been offered by the City Council of Three Rivers, Quebec, as an inducement to the Great Northern Railway Company to make their terminus and establish their workshops in Three Rivers.

Another deputation from the natural gas fields in the vicinity of Windsor, Ontario, has waited on the Dominion Government. It consisted of owners of wells, who desire that there shall be no alteration of existing arrangements. They want to be free to continue piping the gas to Detroit.

E. E. Sheppard, the Trade Commissioner sent by the Dominion Government to South Carolina, has sent in his report for Brazil and Uruguay. Brazil, he considers, offers an excellent market for such Canadian articles as bicycles, agricultural implements, hoes, axes, rakes, spades, shovels, wagons, safes, sewing machines and wood working machines. The whole question of sale, he says, is dependent on credits. There is, he reports, an excellent demand.

The Minister of Customs has changed the rules relating to postal packages with advantage to business men. Heretofore postal packages coming from the United States were sent to one of 18 central Custom Houses, where the duty was collected. Now the rule is to be that the parcel must be sent for duty to the nearest Custom House. This will facilitate an important line of trade between customers in Canada and merchants across the line.

C. A. C. J.

It is expected that the city of New York will be obliged to issue about $40,000,000 of new bonds next year for public improvements.

Statistics issued from the office of the Secretary of State of Pennsylvania show a remarkable increase in the number of charters issued to manufacturing corporations in that State and in the increases of capital stock filed in the past few months as compared with last year's figures. In November, 1896, the total increase of capitalization was $524,000, whereas in November of this year it reached the large figure of $16,200,000.

The first annual report of the Montana State Board of Sheep Commissioners, just issued, shows that during 1897 that State led in wool production, 22,169,921 ponnds of wool having been sheared. Allowing for shipments out of the State, which have been heavier this year than ever before, there are 3,670,855 sheep in Montana, a net increase over last year of more than 500,000. The value of sheep has nearly doubled this year.

The Yukon Commercial Company of Seattle, Wash., have commenced the construction, at Ballard, Wash., of a steel steamer for traffic on the Yukon. It will be built entirely of mild ship steel, and will be the first of the kind built on the Pacific coast. The dimensions of the hoat are, deck 70 feet long, 17 feet 9 inches beam, 4 feet 6 inches molded depth. It will cost when finished $15,000.

The wash house operatives, of whom there are about 2000 employed in the tin plate mills dipping terne plates into the vats, have organized a trade union and will apply for admission to the American Federation of Labor at their meeting next week, at Nashville, Tenn. The wash house men in tin plate works are not included in the Amalgamated Association. It is said that the majority of these workers in the Pittsburgh, Ohio Valley, Wheeling and Indiana districts have joined the new organization.

TRADE REPORT.

Metal Market.

Pig Tin.—There has been hardly as much as a ripple upon the surface of the market during the past week. No speculative interest was manifested at any time, except in the direction of making "official" quotations occasionally, and neither consumers nor jobbers purchased except in a very conservative way. The importations have been moderate and the quantity of Tin afloat is below the average of late, but in the absence of any radical change in London wholesale prices here have been almost stationary. The retail trade was as inactive as the wholesale purchases, in view of the approaching stock taking season, covering little beyond immediate and pressing wants. Jobbers quote Straits Pig in small lots from store at 14¾c. per lb.

Copper.—The market has taken a decided turn for the better. Contracts have been entered by the Calumet & Hecla Company for a large quantity of Lake product deliveries running the first three months of next year. The quantity involved is somewhat in doubt, but probably exceeds 10,000,000 lbs. Prior to this deal a good many fair sized lots, probably 500,000 lbs. all told, exchanged hands at an advance of ½c. over last week's wholesale figures. Retail prices were unchanged, small lots of Lake Ingot ruling at 12¼c., and of Ansonia Grade Casting at 11¼c. per lb.

Sheet Copper.—The demand, as is usual at this late period of the year, was of a perfunctory nature, jobbers and consumers being unwilling to add to their stocks beyond the dictates of absolute necessity. Contracts for extended deliveries were comparatively few, manufacturers not seeking forward business at the present level of prices with any animation. Competition among jobbers for the small business that is passing has been somewhat more keen and prices in a retail way were not quite so strong, although 15c. per lb., basis, is still the nominal quotation for small lots of Sheet Copper from store.

Pig Lead.—A very dull market has been experienced and wholesale prices have fallen a fraction, leaving the market rather weak at the close. To all appearances the only outlet at present is among the smaller consumers, who almost invariably purchase in a hand-to-mouth way. Jobbers quote American Pig in small parcels from store at 4⅛c. to 4¼c. per lb.

St. Louis advices indicate a very dull market, with an utter absence of large purchases. A better demand is anticipated later, however, and some improvement in price may result.

Lead Pipe and Sheet.—A very moderate demand is noted for these materials. Consumers order only such amounts as they require for present use, and little is being done in the way of contracts for future deliveries. Improvement is looked for after the turn of the year, however, and manufacturers are looking also for better prices later on. In the Eastern market Lead Pipe is quoted at 5¾c. and Sheet Lead at 6¾c. per lb., subject to a discount of 20 per cent.

Spelter.—The market is softer, if anything, than it was a week ago. Galvanizers have made purchases at lower figures, and it appears easy to buy ordinary brands at prices which are low as any made within the past six months. The demand, nevertheless, has shown no appreciable expansion, buying being of an extremely tame character. Jobbers' prices have been shaded during the week. Ordinary Western brands are selling in a retail way at 4.50c. to 4.60c. per lb.

The market for Spelter in St. Louis is reported as dull and heavy, and it is thought that nothing but an early improvement in the demand can prevent a lower range of prices.

Antimony.—Prices have undergone no change and the demand continues moderate. Prices for small parcels remain at about 7¼c. to 7½c. for Japanese, 7¾c. for Hallett's and 8½c. for Cookson's.

Nickel.—Prices remain steady at about 37c. to 38c. for small quantities.

Solder.—The decline in Pig Lead has been followed by a reduction in the price of Solder. Genuine Half-and-Half is now quoted in a retail way at 10½c. to 10¾c. per lb., and No. 1 at 9¾c. to 10c., according to size of order.

Tin Plate.—Orders for American Cokes have been light and the market, as a whole, remains dull to the verge of stagnation, with wholesale prices a shade easier. Manufacturers have delivered more freely on contracts during the past week, and have thus kept many buyers fully stocked. The indications are that this will continue for some time, since a number of manufacturers are well sold up on their probable product of the first quarter of 1898. The smaller consumers are purchasing in a hand to mouth way only, and the volume of retail trade was very moderate, all told. No improvement is looked for before the middle of next month. Jobbers' quotations are unchanged, moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore being about as follows: American Coke Tins, IC, 108 lbs.. 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do. 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3 40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are without important change in price and sell in a small way only.

Sheet Iron.—Tne market for both Black and Galvanized Sheets is somewhat quiet and mills are rapidly catching up on deliveries. There is no disposition, however, to press sales, and prices remain steady. A good deal of figuring is going on for Sheets for the first half of next year, and it is probable that some large contracts will be closed within a short time. Small lots from stock sell in this section at about 2 35c. to 2.40c. for No. 27 Common Black Sheets and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago avdvices are as follows: The demand for both Black and Galvanized Sheets has been considerably less, but mills are reported to be still crowded with work and manufacturers' quotations are maintained, although jobbers are cutting. Small lots from stock are quoted at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—The demand is irregular and the market, as a whole, remains quiet. Both domestic and foreign buyers are holding off. Prices are unchanged. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10 50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5 25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

THE IRON MARKET.

There is little to say of the market except that business is dull and prices are somewhat weaker. A great deal of material is going into consumption, but it is believed that the output is gaining; consequently there is an increasing pressure to secure new business. It is believed that the dullness is due more to temporary causes than to any unfavorable change in the outlook, which, as a matter of fact, is brighter than ever as regards the volume of business. Prices are somewhat unsettled, nevertheless, and it will take time to adjust them on a basis that will be satisfactory to all the interests concerned.

Foreign business is assuming very important proportions. There is a steady outflow of almost all kinds of manufactured Iron and Steel, besides Pig Iron, which is recognized as a regular article of export. The export of several hundred thousand tons of Iron and Steel during the coming year will be an important addition to the home demand, which is expected to surpass all former records.

Pig Iron.—The market in the New York district is a little better, so far as inquiry and moderate sales are concerned. Among the orders taken this week is one lot of 3000 tons for export. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No.

2 Plain, $10.75 to $11. Sonthern brands, same delivery : No. 1, $11 to $11.25 ; No. 2, $10.50 to $10.75 ; No. 1 Soft, $11 to $11.25 ; No. 2, $10.75 to $11.

In the Philadelphia market the demand for Pig Iron is very slow and in some cases there are reports of lower prices, but they are not sufficiently authenticated to warrant serious attention. There is no doubt that makers would be very glad to renew contracts at the association prices, and would probably give three or four months' deliveries, but in the meanwhile buyers stand out for lower prices. Although the feeling is not as buoyant as it was a month ago it is by no means certain that a lower range of prices will be established. Quotations are about as follows for seaboard deliveries, subject to the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

The largest reported sale of the week, in Chicago, was one of 1500 tons of local Iron for delivery in next six months. Other sales of fair size were made and on the whole the local producers take a very cheerful view of the situation. Prices are fully up to the level of the past month and seem to be getting firmer instead of weaker. Southern sales agents report a number of inquiries received, but buyers are deferring their purchases, probably in the hope that some weakness may develop. Thus far they have been unable to depress the market. We quote for cash as follows :

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

The Pittsburgh Pig Iron market continues quiet and prices for December Bessemer are lower. The consumption of Pig Iron at the present time is enormous, and with the capacity about all employed it would seem that prices on the present basis are about as low as they will go. There is considerable figuring going on for Iron for the first quarter and first six months of next year, but so far little actual business has been closed. Some speculators have again appeared and are getting prices on Iron with a view of buying. Foundry Irons continue quiet. We quote f.o.b. Pittsburgh as follows: No. 1 Foundry, $10.65 to $10.75; No. 2, $10.15 to $10.25; Bessemer, $10.

There has been a very material increase in the number of orders for Pig Iron in Cincinnati, and while none of these have been for anything like round lots, yet they have been coming in from all classes of consumers from all sections of the country tributary to that point, quite a large percentage of them by telegraph, and all of them in a hurry for the immediate delivery of the goods. The number of those inquiring for large amounts has increased a trifle, though none of this inquiry for round lots within the past week or two has developed into actual transactions. The small run of orders which are being taken are, as a rule, going at full quotations. It is believed that some Iron can be bought at less than the regular quotations, but the offerings in this way are not large enongh to materially influence general trade. In a word, quotations are nominally unchanged, and in the absence of anything to the contrary may be said to be fairly steady. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The St. Louis market continues in the quiet condition last noted. New contracts are hard to close, as consumers are not anxious to do anything until after the turn of the year. Shipments on contracts already in force are being ordered forwarded, and there is more or less complaint on the part of consumers because of the inability of furnaces to make prompt shipments. Stocks on furnace banks were never so low, and are being decreased daily, while prices are being strictly maintained at the prices quoted below. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—The market for old material is extremely quiet. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3 75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5 50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9 c.
Red Brass	....	7½c.
Yellow Brass	....	6½c.
Light Brass	....	4 c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—No improvement has taken blace in the demand and concessions are still made. The card on carload lots of 12 tons minimum is now as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

The Keystone Bridge Works of the Carnegie Steel Company, Limited, at Pittsburgh, have commenced tearing out the long viaduct leading to the bridge on the Pittsburgh & Lake Erie Railroad which spans the Ohio River at Beaver, Pa. This is being done preparatory to rebuilding the bridge to accommodate double tracks. When this has been accomplished the Pittsburgh & Lake Erie Railroad will be double track throughout from Pittsburgh to Youngstown, a distance of 68 miles. We have already made mention in these columns of the fact that three new locomotives built by the Pittsburgh Locomotive Works have been put in service and are hauling trains of about 75 cars between Pittsburgh and Youngstown. Recently two more of these engines have been placed on the road. A contract has been placed with the Pittsburgh Locomotive Works for five more. Very extensive improvements are being made and are contemplated by the Pittsburgh & Lake Erie Railroad. A large amount of money has been spent equipping yards at Haselton, on the main line, and also at Glassport, on the Monongahela division. The rolling stock is being improved wherever it can and new freight sheds and a new depot are being built on the south side of Pittsburgh. It is the intention to put this road in position to meet any competition which may come from any source. The building of this road was of very considerable advantage to manufacturers of Pittsburgh and also the Valleys, as it established a new connection between Pittsburgh and Youngstown, while before it was built there was but one road, this being controlled by the Pennsylvania Company.

The City Council of Chicago have passed an ordinance providing for the elevation of 12 miles of tracks of the Chicago & Northwestern and Chicago, Milwaukee & St. Paul Railroads, at an estimated cost to those companies of $3,200,000. Further ordinances of a similar nature are pending in connection with other roads.

THE HARDWARE TRADE.

Business feels the influences which at the near approach of the holiday season tend to diminish the volume of trade, but on the whole the demand continues fair, and in some lines it is still very satisfactory. The tone of the market is on the whole steady, but perhaps not quite so strong as it has been, manufactured products reflecting the condition of the markets for raw material and the lessened demand which is to be expected at this time. The matter of the consolidation of Wire Rod interests continues to attract the attention of the trade at large, and while the negotiations are simply progressing and have not been consummated, they have an influence on the market, stimulating purchases, especially of Wire and Wire Nails. It is obvious, however, that if the project is carried out it will have a much wider bearing and that other lines will promptly feel the effect. The closing month of the year seems likely to be a fair one, and some of the jobbers report business in better volume than usual. Matters connected with the closing up of the business of the year and preparations for the annual inventory are receiving attention, while merchants and manufacturers alike are naturally beginning to consider definitely their plans and projects for the coming year.

Advices from Chicago.—Jobbers report an extraordinary demand for the time of the year. The continued good trade shows that farmers have plenty of money and that the West is therefore prosperous. The movement is good in everything. It might be supposed that the lateness of the season would interfere with Builders' Hardware, but this is also called for in good quantities. Holiday merchandise is moving freely. Skates are in heavy demand. Snow Shovels have suddenly become objects of interest, owing to the deep snows in a large part of the West. The month undoubtedly will make a good record. Sales in November were far ahead of November of last year, and December will also make a good showing for itself. The demand for Heavy Hardware keeps up equally well.

Advices from St. Louis.—The Hardware jobbing trade is nearing the point where it reaches close to absolute dullness. The last half of December is invariably dull, and this month will not likely prove an exception to this rule. The jobbers are now making comparisons, and the business done this year will show substantial gains over last year. Much interest attaches to the proposed combination among the Wire interests, and while jobbers as a rule do not look for any advances should the combination go into effect, yet they are naturally interested, as it is likely to bring about radical changes, particularly as regards the selling department. The demand just now runs largely to staple and holiday goods, and while there are no radical changes in prices to note, the tone of the market is not as strong as it might be. Collections are quite satisfactory.

NOTES ON PRICES.

Wire Nails.—There has been little change since our last issue in the general features of the Wire Nail market. There has been a good deal of activity in the market, jobbers and retailers alike endeavoring to cover their early requirements before the advance they anticipate takes place. Meanwhile the negotiations between those interested in the Rod consolidation are continued, and those directly identified with the movement report favorable progress. It is acknowledged, notwithstanding the reports current in the daily papers, that the project is not yet consummated, and it obviously cannot be accepted as an accomplished fact until many details are settled and the contracting parties have formally assented. The opinion of the trade is divided in regard to the probability of the consummation of the plans in hand, but the fact that an effort is being made in this direction has its effect on the market, of which the manufacturers are prompt in taking advantage. New York quotations are $1.60 to $1.65 for small lots from store.

Advices from Chicago.—The situation has changed decidedly. The Hardware trade have now thoroughly wakened up to appreciate the fact that the proposed consolidation of Wire interests may be consummated. Very heavy inquiries have been turned down the past week by manufacturers. Some have withdrawn all quotations, while the others have advanced their prices. Nobody is quoting for January delivery at present prices, but an advance of 10 cents is asked. Jobbers have also revised their prices and are now quoting $1.50 for small lots from stock.

Advices from St. Louis.—Rumors regarding the combination of Wire interests are thicker than snowflakes, and yet they have such a tinge of genuineness that mills have advanced their prices and are not disposed to accept business except for immediate shipment. Inquiries are in the market for large quantities of Nails, but sellers are hard to find except at a material advance. Jobbers have advanced their prices and are a unit in asking $1.60 to $1.65, base, for small lots from store.

Cut Nails.—There is very little change to note in the Cut Nail market. The demand is only moderate, and buyers are evidently deferring purchases so as not to carry over heavy stocks into next year. New York quotations for small lots from store are $1.35 to $1.40.

Advices from Chicago.—No change has occurred in Cut Nails, which are still selling at $1.45 for small lots from stock.

Advices from St. Louis.—The market shows no signs of improving, and the low prices referred to in our last report continue to rule. Jobbers ask $1.40 to $1.45, base, for small lots from store.

Barb Wire.—The volume of business has increased in view of the proposed Rod pool, and the market is firm.

Advices from Chicago.—The change in the Wire Nail trade also has its related movement in this branch. Former prices have been withdrawn by manufacturers. Jobbers quote small lots from stock at $1.60 for Painted and $1.90 for Galvanized.

Advices from St. Louis.—The market is quiet, but manufacturers have taken advantage of the probable favorable outcome of the Rod combination and advanced prices.

Glass.—The Window Glass situation has shown no change during the past week. No agreement has been reached regarding the wage scale and none of the associated factories have resumed operations. Retailers are complaining at the price asked for Glass by jobbers, which is 60 per cent. discount both East and West. The complaint is making itself manifest in a further diminution of business. The uncertainty as to just how soon the associated factories—or, as they are now known, the American Glass Company—will resume prevents orders being placed for foreign Glass in sufficient quantities to supply the demand. Imported Glass is quoted at 80 and 10 per cent. discount, and not at 60 and 10 per cent. discount, as was erroneously stated in this report last week.

White Lead.—Orders for Dry Lead have been very fair, but chiefly for moderate quantities for delivery during the balance of the year. The dealings in Lead in Oil, while only fair in volume, were quite as liberal as could reasonably be expected. No changes in prices have been made by the leading corroders, and no intimation is given of any intended revision of current list prices and terms in the immediate future.

Red Lead.—There has been fair buying of moderate sized lots for early delivery, and some contracts were closed for good sized parcels for delivery during the fore part of next year. Prices were virtually the same as have prevailed for a considerable time past.

Linseed Oil.—The cost of Seed has advanced further during the past week, but the demand for Oil has continued slow for the season and dealings at present are on a rather small scale. Oil is relatively lower than Seed at the moment, but the probability that higher figures for the latter would lead to sharper competition prevents any considerable advance in prices.

Spirits Turpentine.—Business has fallen off somewhat and retail prices have weakened slightly, or to 33½c. to 34c. for small lots.

Northwestern Material Progress.

During the present winter the amount of timber to be cut in the forests of Minnesota will probably exceed any preceding season, and will be nearly double what was cut in the last winter. The Mississippi district will cut this winter not far from 550,000,000 feet, as against 240,000,000 last winter, while the Duluth district will cut 500,000,000, the St. Croix 350,000,000 and the new Red Lake region 150,000,000. Of all this 400,000,000 feet will be taken out of the woods by railroad, there having been a movement toward hauling timber by railroads in the past few years that has grown to immense proportions. It is estimated that 20,000 men and 10,000 animals will be employed in the woods the entire winter, and that the wages paid the men will be above $20 a month on the average. A year ago there were not over 10,000 men and their wages were not over $15 a month.

The Calumet & Hecla Copper Mining Company have just declared a fifth $10 dividend for the current calendar year, making total dividends for their existence $50,850,000.

Dividends have been paid by the mines included in what is known as the Homestake group in South Dakota of $11,207,500, of which the Homestake, the largest of the group of three, has paid more than half. In the past year the Homestake has crushed almost 400,000 tons of rock,

and the other two companies not far from the same quantity. The value of rock from the Homestake proper in the past year has averaged $4.78 a ton, for which all but $1 went to pay operations. About 0.5 per cent. of the company's returns were from silver, the rest from gold. The Black Hills, as a whole, in which are these mines, will this year win about $9,000,000 in gold.

It looks as if the elevators on Lake Superior would be swept clean of wheat by the close of navigation this year, which is likely to be later than was ever known. About 4,000,000 bushels of wheat are sold to go East yet before the close, most of it to exporters, though 500,000 bushels go to P. D. Armour, at Chicago. Rates to vessels have risen to 5 cents a bushel, at which one of the new freighters can earn $10,000 a trip.

The town of Eureka, S. D , which enjoys the distinction of being the greatest primary wheat market in the world, has received on the present crop 1780 carloads of wheat and flax, and its farmers have taken in about $1,500,000 cash for their grain and stock. The district around Eureka is settled almost entirely by families from Russia, and the C., M. & St. P. road is the only line touching the place.

Lake Ore Matters.

DULUTH, December 2, 1897.—It is understood that under the new Tilden lease to the Carnegie interests the royalty to be paid will be 50 cents a ton. Mr. Rockefeller will take half of this as well as a bonus of $500,000, a sum that is supposed to go very far toward paying for the improvements put into the mine. The old royalty to the fee holders, 30 cents a ton, has been reduced to 25 cents, so that the full royalty cost to the Oliver Company is 50 cents a ton. With lowest possible mining costs, even at a mine operated at very low underground expenses, a royalty of this amount and lake freights equal to those paid by Mesaba and Vermillion mines, the new operators of the Tilden can scarcely expect to deliver ore at a cost very much lower than some other properties. The minimum agreed output is 400,000 tons a year, and the lease is to run 50 years.

The contemplated increase in authorized capital stock of the Duluth & Iron Range Road from $3,000,000 to $10,000,000 has been made, but no steps will be taken at present, nor probably for some time to come, to add largely to the $500,000 total issued capital. The stock will be disposed of as money is needed for extensions. These contemplated extensions, as outlined by the company, include a line of 63 miles east from the road's present terminus at Ely to the mines of Gunflint Lake, where a connection will be made with the railway running to Port Arthur, on Lake Superior, in Canada. Another line is planned into the Rainy Lake gold region of West Ontario. Another is a direct Mesaba line from the company's Two Harbors docks, cutting off two sides of a triangle and touching the Mesaba in the vicinity of the Fayal and Genoa mines.

Capitalists are understood to be looking at Lake Superior, more particularly Marquette, as a possible location for an extensive iron and steel industry. Newspapers at Duluth and Superior have for a long time amused themselves and tickled their readers by their predictions of the early control of the works of a concern with a sounding title—the West Superior Iron & Steel Company—by John D. Rockefeller. So far as making steel is concerned the present plant of this company is not of much value, and would have to be not only remodeled but entirely rebuilt and enlarged before it could make any impression as a competitor. Mr. Rockefeller is not an iron maker and doesn't want to be, and the prophecies that are made are simply ridiculous. The same people have named the Carnegie interests as also likely to locate at the head of Lake Superior. This prediction is as preposterous as the other.

A 10 per cent. increase of wages is to take place at the leading Menominee mines January 1, bringing the scale paid there about up to those of the Marquette and Vermillion ranges, where miners fare better than elsewhere.

W.

Anthracite Coal Trade.

The December letter of the Anthracite Coal Operators' Association says: Throughout the past month the market has been one of weakening prices and slow and irregular demand. Dealers have, almost without exception, reduced their stocks to a merely nominal amount, and the few days of cold weather brought about a momentary activity in buying from first hands, which, however, disappeared quickly. The entire trade of the tidewater and Eastern markets has been in the buyers' hands, and they have set a figure which they would pay, in the certainty that if the coal could not be purchased at that price from one seller it could be had from some other one. The ease with which this could be done demoralized prices, until, at the close of the month, no figure could be named for the maximum, minimum or average of the market. Beginning with December, there is to be a radical change in the methods which have been pursued. Colliery time will be reduced nearly one-half, bringing the probable output to 3,000,000 or 3,500,000 tons for the month. This will enable the companies to dispose of both the tonnage mined and that held in stock along the lines, and at the same time will strengthen prices in all markets. This latter will be more easily accomplished since dealers have exceptionally small stocks on hand and will be compelled to purchase for their current demand.

Stove AND Steel Range Manufactory

Located at MUNCIE, IND.,

To be Sold at Public Sale.

The stockholders of the JOSEPH BELL STOVE & RANGE COMPANY have passed an order to sell their plant and equipment and stocks of material and manufactured stock at public sale, on Wednesday, the 5th of January, 1898, on the grounds of the company at MUNCIE, IND.

The property consists of over 6 acres of ground conveniently situated at MUNCIE, IND., on the West Bank of White River, on the line of the Lake Erie & Western Railroad and accessible to the Big Four Road. The buildings thereon are nearly new and of substantial construction. The Molding building, of brick, is 135 by 145 feet. There are two cupolas. The Mounting and Storage building, also of brick, is two stories high, 260 by 60 feet. Office building and show room of frame, two stories. All of the best construction and conveniently arranged.

There is a complete Nickel Plating plant. There are tools and appliances for the economical turning out of the best class of work.

There is a large line of patterns which includes cooking and heating stoves and a line of popular Steel Ranges.

A gas well on the premises belonging to the company furnishes an abundant supply of natural gas. These works have been in operation until recently and are in order to resume work at any time.

The entire property, including all stock on hand at day of sale, materials, patterns, tools and equipment and good will, will be sold in one lot. Sale to take place on the grounds of the company, at MUNCIE, IND., on Wednesday, the 5th January, 1898.

The terms will be made accommodating. Persons desiring information will please address the undersigned.

JOSEPH BELL STOVE & RANGE CO.,
Muncie, Ind.

OWING to the death of the proprietor, a Stove, Heating, Plumbing and House Furnishing business is offered for sale, in Claremont, N. H. A growing manufacturing town of over six thousand inhabitants. This is a first-class] opportunity for any one wishing to engage in this business.

THIS volume has been compiled from the extended series of articles in *The Iron Age*, on the arrangement of Hardware Stores, and contains a large and varied mass of information in regard to store arrangement.

A chapter is devoted to each subject and all are fully illustrated.

The summary of contents will convey an idea of the wide scope of the work, which treats of almost every subject connected with the arrangement of Hardware Stores.

Every hardware merchant should have a copy.

MAGIC

Stage Illusions and Scientific Diversions Including Trick Photography.

COMPILED AND EDITED BY
ALBERT A. HOPKINS.

WITH AN INTRODUCTION BY
HENRY RIDGELY EVANS.

568 Pages, 420 Illustrations.

Price, by mail, $2.50.

THIS new work on Magic, Stage Illusions and Trick Photography appeals to the professional and the amateur alike, and will prove a welcome addition to any library and will be read with interest by young and old. The illusions are well illustrated by engravings which fully explain the nature of the tricks. Great attention is paid to the exposés of large and important illusions. Some of the most important tricks of Robert Houdin, Bautier de Kolta, Kellar and Herrmann are explained. Conjuring tricks are not neglected, and Fire Eaters, Sword Swallowers, Ventriloquists, etc., all come in for a share of attention. The section devoted to "Photographic Diversions" is very complete, illustrating the most important forms of trick photographs which the amateur can make. There is also a valuable Bibliography of Books on Natural Magic. The book is a large octavo and is handsomely bound.

☞ An illustrated circular giving specimens of the engravings, together with a full table of contents, will be mailed free to any address.

Sent, post-paid, upon receipt of price, by

BERGER BROS., - - Philadelphia.

Office and Stores: 231 and 237 Arch Street.
Factory near Germantown Junction.

WE wish to call attention to the line of goods for which we are able at all times to quote most advantageous prices.

Our specialty is the manufacture of HIGH QUALITY ROOFING PLATES, and our Brands are known as the standard in their respective grades.

ROOFING TIN PLATE—BRANDS.

"Scott's Extra Coated"	"ABSOLUTELY THE BEST" 47 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method"	Strictly Hand Dipped, Palm Oil process throughout, 38 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 40 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style"	Very bright, clean and handsomely mottled, 28 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest"	The very best Bright Charcoal Tin. Supero coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton"	An excellent plate, well coated. "Melyn" grade.
"Furnace"	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

GUMMEY, McFARLAND & CO., Philadelphia.

Gentlemen:—We desire to present to you our testimonial regarding your Gummey's Anti-Pinhole tin plate. We believe that you have at last solved the problem by giving us a genuine charcoal iron tin plate thoroughly coated, and we cheerfully recommend it to any tinner who wants to sell good ware and give good satisfaction, to use it.

Respectfully, FICKERT & KOKAL.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

DAVID WILLIAMS COMPANY,

232-238 William Street, New York.

TIN ATLANTA TERNE

The use of Acid Flux has been considered essential to success in making Coke Tin Plates. Atlanta Plates prove the falsity of this, however, as not a particle of Acid Flux is now used in their manufacture. Their softness makes them very easy on Can Makers' dies.

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, **$1.00.**

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

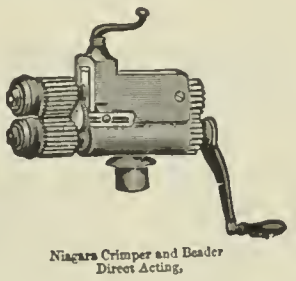
Niagara Brass Mounted Groover.

Niagara Brass Mounted Groover.

The reversible round horn permits of grooving work 2 inches in diameter and larger. The seam can be grooved toward the inside or outside of the work. Capacity No. 24 iron.

The No. 2 Niagara Groover grooves the seam on the way forward, and flattens it on the return trip.

Niagara Stove Pipe Crimper and Beader.

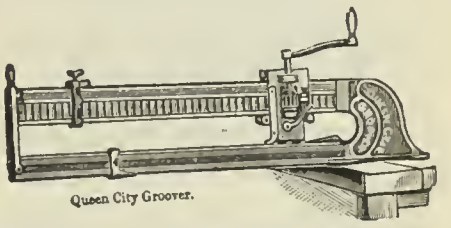


Niagara Crimper and Beader
Direct Acting.

It crimps and contracts the edges of stove and conductor pipe, to facilitate putting the lengths together. The rolls are of steel, and the gears machine cut.

The direct acting machine works faster; the geared one is easier to operate.

Queen City Groover.



Queen City Groover.

It grooves and closes the seam at the same operation, making it unnecessary to hammer down the seam with a mallet. Will groove pipe No. 24 gauge and lighter, not less than 2¾ inches diameter, up to 32 inches long. Can be furnished with round horn same as on the Niagara Groover, in place of the square horn.

Four grooved rolls $\frac{3}{16}$, $\frac{5}{16}$, $\frac{7}{16}$ and $\frac{9}{16}$ inch are sent along.

Make Money

By using the **Universal Slip Joint Machine** in connection with any Eave Trough Machine if you have one; if not, get a good one from us.

This machine does the cutting, folding and closing of Slip Joints either attached to or separate from Eave Trough and **saves nine-tenths of the labor** and does better work.

Remember also, we are manufacturers of **Beading Rods** of all kinds.

For information and prices address

THE UNIVERSAL MACHINE CO.,
CANTON, OHIO.

—Haggling Over Bargains.—In the old haggling way of trade which has, in this country, at least, happily gone out for the most part, and been replaced by the more honest system, in which a dealer puts a fair profit upon his goods and sticks to that, it was customary to demand a great deal more than the asker hoped to get.

One time on the Texas frontier a man came into camp riding a mule.

"How much for the mule?" asked a bystander.

"Jist a hundred dollars," answered the rider.

"Ill give you five dollars," said the other.

The rider stopped short, as if in amazement, and then slowly dismounted.

"Stranger," said he, "I ain't a goin' to let a little matter of $95 stand between me and a mule trade. The mule's yourn.—*New West Trade.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

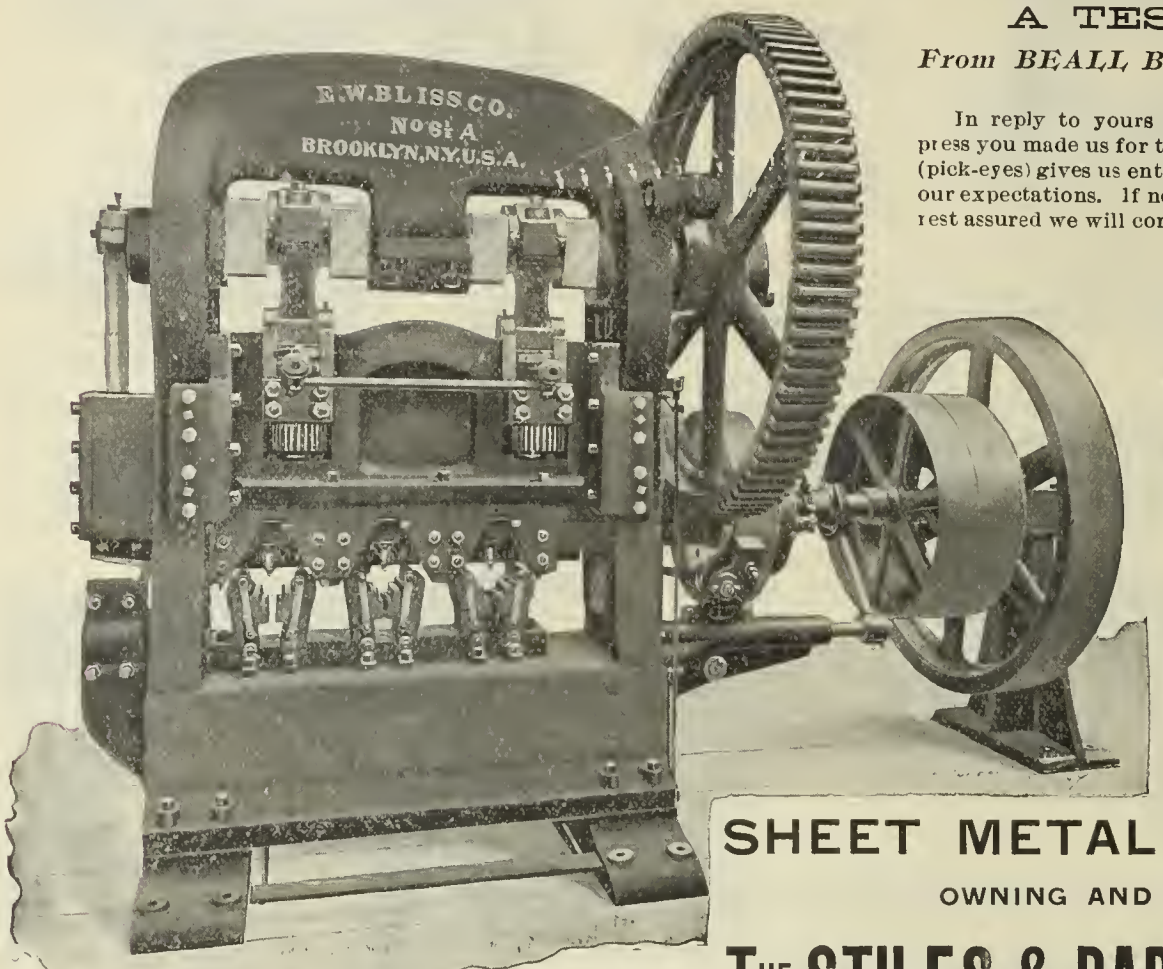
WATCH OUR SPACE.



No. 6½A "BLISS" PICK-EYE FORGING PRESS (Patented).

A TESTIMONIAL.

From BEALL BROS.

ALTON, ILL., April 10, 1896.

In reply to yours of 8th inst., will state that the large press you made us for the manufacture of goods in our line (pick-eyes) gives us entire satisfaction and more than meets our expectations. If needing anything in your line you can rest assured we will correspond with you.

MAY 1, 1896.

Our machine is working perfectly in every respect, and we are making from 1,200 to 2,000 pick-eyes a day, and it gives us no trouble whatever. We occasionally break a punch, but that can be changed in a few moments' time, as we have some made up, and all we have to do is to take out the old one and put in a new one.

QUICK MEAL

"Quick Meal" Gasoline Stoves.

"Quick Meal" Gas Ranges.

"Quick Meal" Blue Flame Oil Stoves.

For 1898 the "Quick Meal" Blue Flame Oil Stove has embodied in it all the special and valuable features found therein during last season, and a good many have been added thereto, while all points subject to improvement have been carefully looked into and made perfect. The Tank is made of Brass and composed of only two pieces, jointed with a single seam, which makes it leak-proof. The ends of the Tank (the parts which show) are polished—one of the Drums of each Burner is also constructed of polished Brass. The Wick-raising device is the simplest and most reliable.

Ringen Stove Co.

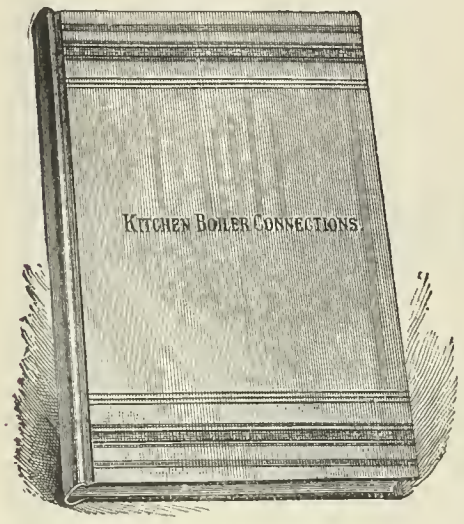
KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

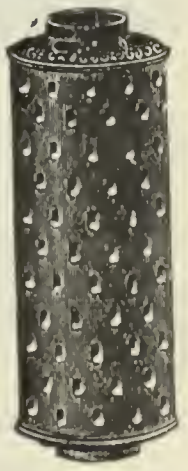
New Era Radiators

do this, and there is a big profit on every one you sell. Drop us a card and we will send you a circular telling all about these Radiators and our special inducements for handling them. Do it now, so as to be ready for the opening of the season.

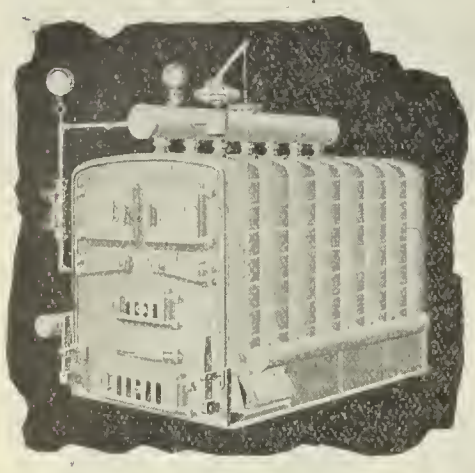


CYLINDRICAL STYLE.

WILMOT CASTLE & CO., 76 Elm St., Rochester, N. Y.

no bricks.

The outer surface of each section of this heater has cast iron ribs, which allow the boiler to be completely covered with asbestos cement—if that is desired. The use of the



"AMERICAN" STEAM HEATER

does away with the usual large amount of cumbersome brick-work required in setting a horizontal tubular, or other type of heater, in which the firebox is formed of brick. That means a saving of room and a saving in cost of apparatus.

HOWARD AUTOMATIC DRAFT REGULATOR

GUARANTEED.

IT ADJUSTS ITSELF TO THE WORK REQUIRED
and With Human Intelligence
GIVES EVEN TEMPERATURE, SMALL COAL BILLS, HEALTH, COMFORT.

The Damper

Regulates Furnaces, Steam or Hot Water Boilers.

MADE BY
HOWARD THERMOSTAT CO.
N. Y. OFFICE— OSWEGO, N. Y. —210 WATER.

The **Thermostat Plate** is placed on the wall of a living room and operates solely by power obtained from contraction and expansion of metals. By means of a connection over pulleys it automatically operates the **Cylinder Damper** connected to heater.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

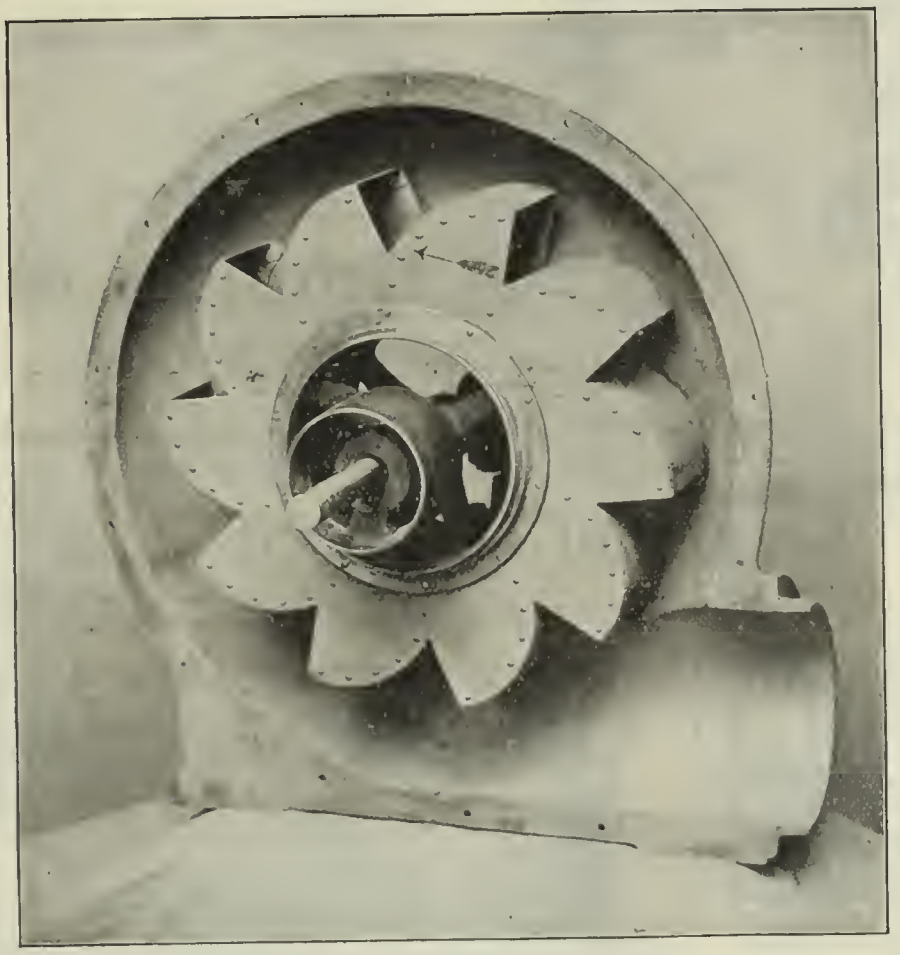
ANNOUNCEMENT.



Office of THE NEW JERSEY BLOWER COMPANY.

NEWARK, N. J., December 1, 1897.

TO THE TRADE:

We take pleasure in announcing that we have made arrangements with Messrs.

J. B. & J. M. CORNELL,

26th St. and 11th Ave., New York,

under which they will assume the manufacture and sale of the New Jersey Steel Pressure Blowers and Exhausters heretofore made by us.

In this connection we congratulate the trade upon the advantages to them of this arrangement in view of the recognized position of Messrs. Cornell and the increased facilities which they possess at their West Point Foundry, Cold Spring, N. Y., for manufacturing and marketing the machines, and we solicit for them a continuance of the favors which have been accorded to us.

AVOID MISTAKES AND LOSS
BY USING THE
CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1 00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Sent, prepaid, on receipt of price by

High Grade Enamel Ware.

This Trade Mark on bottom of each article. ☞

DOUBLE COATED and ABSOLUTELY PURE.

AGATE NICKEL-STEEL-WARE J. & G. MFG. & CO.

Contains no ARSENIC, ANTIMONY, LEAD or other poisonous ingredients.

Others may claim purity, we alone substantiate it by chemist's certificate attached to each article.

"We have made a critical examination of the products of nearly a score of the manufacturers of such goods, and the only articles of the kind found to be absolutely free from all the dangerous contaminations of which mention has been made are those known as 'Agate Nickel-Steel Ware.' The makers of this ware possess an exclusive patented process by which, through the intervention of a coating of nickel, the impervious or enamel coating is caused to adhere to the steel, thereby doing away with the necessity of a lead bath or the employment of antimonial or arsenical preparations to achieve such results."—C. H. Brace, M. D., in *American Journal of Health.*

THE HILL-WHITNEY ALUMINUM CO., - - Boston, Mass.

—FILLING AN ALLOTTED SPACE.—It was the practice of a certain London editor some years ago to write his leading article or articles at home the night before publication. The rest of the week he did nothing. One night his articles had not come to hand at the office. Ten o'clock came, 11, 12 and still no sign of an article. There was commotion in the office, and at last a message was sent to the editor's house. He found him with a glass of brandy and water before him, and newspapers scattered about. There was no article written.

"What do you want?" asked the editor.

"The article for to-morrow."

"Didn't I send it?"

"No; at least it has not come to the office."

"Give me the Times."

The Times was found and handed to him, and with unsteady fingers he cut out one of its leading articles. This he stuck upon a sheet of paper, and then, taking his pen, wrote at the top: "What does the Times mean by this?"

In that form and with that introduction it appeared next morning as the editor's leading article.

furnace talk

The furnace dealer is often to blame by confining himself to competition where the first cost is the main condition of a contract. It is morally certain that the lowest price will afford the least amount of heating surface and the adoption of the cheapest materials for manufacturing purposes.

The Howard Double Radiator Furnace is not cheaply made. It is built as good as the best quality of iron and mechanical skill can contrive. The down draft is a distinctive feature in itself and lends originality to this form of construction. The two rings which encircle the body of the furnace mean something. They represent actual heating surface. When a fire is started the flames pass immediately up into the top of the combustion chamber, then down into the hollow radiator and around the furnace and down again into the other radiator, finally out through the elbow at the base of the furnace to the smoke-pipe. Whatever may be the argument in reference to the consumption of fuel from an economical standpoint, the principle of saving fuel remains the same. It is simply a question as to the length of time and extent of space which the product of combustion is made to take before leaving furnace. With a good chimney and when properly set this furnace is capable of doing more work with the same amount of fuel than any heater on the market to-day. Agents are wanted to sell this furnace.

The Business Situation.

Considering that we have reached the last week but one of the year, the movement of trade, as a whole, maintains a surprisingly good volume. Although business in winter goods has been held back to a considerable extent by the unusually mild weather prevailing in all parts of the country, trade reports show that the demand for holiday articles is away ahead of anything recorded for this season in many years past. Reports from retailers in most of the larger cities at a distance from New York indicate a marked increase of custom in this line, and even in the East improvement is noted. At the same time there is the usual falling off in many lines of trade. The wholesale houses have been reducing their stocks so far as convenient, in order to carry over as little as possible into the new year's accounts, and buyers have followed a similar policy. Dealings in the speculative markets have not been heavy. Thus last week's returns of bank clearings showed a smaller total than in the previous week, which was one of the best of the year. The clearings of last week were large, however, even when compared with previous years of prosperous business, and were one-fourth better than they were in the corresponding week of 1896. Railway earnings are excellent, showing exceptionally large increase over last year's figures. One by one the roads are returning to the ranks of dividend payers, and the value of their stock is appreciating in the market. Exports continue remarkably heavy, and include some large shipments of machinery and other iron and steel products. November's figures exceeded $115,000,000, and for the 11 months the aggregate was over $970,000,000. The records of all previous years, either calendar or fiscal, seem likely to be broken by 1897, as the largest aggregate ever before known was $1,051,000,000, in the last fiscal year. Wheat shipments to foreign countries exceeded 6,000,000 bushels last week, and exports of this grain since July 1 have been about 111,000,000 bushels or 5,000,000 bushels more than in any similar period in the history of the country. The demand for corn, too, continues heavy, and cotton, while still selling at low and unprofitable prices, shows an improving tendency as the outlook for an increased consumption abroad grows favorable. The probable combination of large wire and wire rod interests has stiffened prices a little in that line, and some large orders for billets and structural material have been placed in the past week. The metal trade has been dull, with prices virtually unchanged. Copper, however, displayed a firmer tone, and tin plates show a little more life.

Our Manual Training Schools.

Beneficial results of a varied character are flowing from the establishment of manual training schools. Some of these are of a nature that was hardly foreseen by those who planted the seed for such institutions. Our methods of manufacturing, which are becoming more clearly defined every year, by which a man steadily runs a single machine or performs but one operation, are destroying the old ideas of learning a trade. A workman is now a specialist, just the same as men in other walks of life. The general mechanic, the all around man, once so numerous in this country, is fast disappearing. Yet the apprentice in a country shop, in which a little of everything is done, can no longer claim superiority over his brother in the city, because the machinery in a rural shop is not apt to be of the most modern character. The country bred mechanic can do well in emergencies requiring self reliance and perhaps ingenuity, but if he enters a large manufacturing establishment the chances are that he will require considerable instruction to become able to run the improved machinery found there. The operations requiring special skill and superior knowledge are also likely to be invariably intrusted to old hands known to be able to do the work properly; so that the beginner stands no chance in that direction unless he is specially favored.

Value of the Training.

The establishment of manual training schools, however, is filling a serious gap in our mechanical development, resulting from the causes enumerated. The instruction given is of such a wide scope in any branch taken up that the completion of the course fits the student to enter his vocation as a wage earner with a much more ample equipment than either the modern or the ancient apprentice. He not only possesses the practical knowledge requisite, but also has the scholastic training which makes him a thinker. The poorest manual training school gives instruction in drafting, mathematics and other studies, enabling the student to work from plans and, if he has any originality or mechanical talent, to prepare designs when required. But within very recent years a great impetus has been given to instruction of this character by the endowment of schools and colleges by wealthy men, who discern in the proper mechanical training of the rising generation a correct outlet for their own philanthropic impulses as well as a patriotic duty devolving upon them. This has resulted in signal instances in the equipment of these institutions with machinery and appliances of the most advanced character, far better than anything found in the average shop.

Growth in the West.

The managers of these schools are not obliged to be satisfied with the simple tools and elementary machines once deemed entirely sufficient for the purpose.

They are able to call upon the builders of the most ingenious machine tools for their best creations and to install in their workshops the latest developments of scientific construction. Graduates of such schools know how to turn out good work and are not satisfied with anything short of the standard to which they have been trained. Schools of this character are increasing in the West, in a section in which they are needed. Several have been munificently endowed by wealthy philanthropists within the past year or two, some of which are just being equipped. Builders of high class machinery are consequently finding in the growing manual training schools quite a market for their tools. But further than that, they are perceiving the effects of this special training in orders for such machinery from graduates who are now running factories or machine shops. The leaven is leavening the whole lump.

The Progress of By-Product Coke Ovens.

After a good deal of missionary work, says *The Iron Age*, and what appeared to be a strange hesitation in adopting modern coking methods, improvement in that direction is now under full headway. We have in the past expressed the conviction that in the technical department there is no line of work which promises to effect so material a reduction in the cost of manufacturing iron and steel in this country as does the introduction of Continental systems of coking with recovery of by-products.

The matter has entered into a new phase in this country, which may have a very important influence upon developments in the iron trade. In Europe all of the by-product coke oven plants, so far as we know, make fuel for the iron industry.

The ammonia, tar, benzole and surplus gas are incidental products. With us a new departure has been taken, the coke ovens becoming a part of municipal gas plants, the surplus gas being used for fuel and illuminating purposes. The coke goes into consumption for foundry purposes, for general industrial requirements and for domestic use, and ceases to be the main object of manufacture. Those who have done the principal work in this direction are the representatives in this country of the Otto-Hoffmann system. Construction has begun at Boston on a block of 400 ovens, the plans looking toward the erection, ultimately, of 1200 Otto-Hoffmann ovens in connection with the gas interests of Boston. We understand that negotiations are pending for the building of an additional large number of ovens at another tidewater city.

In the meantime there is great activity in the building of plants coupled with iron works. The Solvay Process Company have decided to double the number of Semet-Solvay ovens at the Ensley works of the Tennessee Coal, Iron & Railroad Company. In the Wheeling district the Riverside Iron Works are putting up 60 ovens at Steubenville and 60 ovens at Wheeling.

At Dunbar, Pa., the original plant of 50 ovens is to be doubled, and the same is true of the block of 25 ovens at Sharon, Pa. Negotiations are pending with one of the largest steel producers of the country and efforts are also being made to finance for a large plant in the Central West. In the Birmingham district two important interests are studying the problem.

Since the large pioneer plant of Otto-Hoffmann ovens at the works of the Cambria Iron Company, to which 100 ovens are to be added in the spring, there has, therefore, been much activity, and the question is naturally arising in the minds of some observers whether there is not some danger that the markets for by-products will not be seriously interfered with. If the iron manufacturers who invest money in by-product ovens, or tie themselves up with contracts with builders of such ovens, are to meet competition in by-products with large municipal gas companies, then there may not be as much money in the business in the future as has been hoped. Those who most closely watch the situation claim that the market for the by-products is practically unlimited, but perhaps it may be found that it will take a sharp reduction in the prices to expand consumption.

Primitive Metal Workers.

The earliest miners and metal workers of whom we have record, says *Self Culture*, were the Aryan peoples of Euro-Asian origin, who, though of pastoral and arboreal habits, were familiar with the metals and worked with them—at least with the metals gold, silver and bronze. Chaldeans and Assyrians, as we now know from the cuneiform inscriptions which go back 3000 B.C., were undoubtedly expert in the use of metals, while the Egyptians had an intimate knowledge of the arts and sciences. In the brick and other inscriptions recently discovered artisans are seen at work with curious details of their methods and tools. Potters, indeed, had attained eminence in their art, and the Egyptians had certainly a knowledge of chemistry, as the samples of their glass blowing and the stone pictures of tools, forceps, blow pipes, &c., prove. Gold was largely used at an early period—between 4000 and 5000 B.C., as we find from some newly discovered and ingenious weighing balances. Many centuries older than the pyramids, which date from 50 to 60 centuries back, we have examples of engineering in Memphis which could not have been constructed without tools and necessarily an acquaintance with metals. The word "metals" is of Semitic origin—the Hebrew word "metals," to forge, indicates an early acquaintance with the fusing of ores and the malleability of metals. How these early primitive people discovered the uses of things must, of course, have been through their wants and needs, particularly after they left pastoral and tent life and began to build cities. The Arabs are credited with being early acquainted with the alloys, though alchemy, as a science, dates only from the sixteenth century.

We are in receipt of a copy of the eighteenth annual report of the Indian Industrial School, Carlisle, Pa., which gives particulars relating to the educational and industrial training of the young Indian men and women at that institution during the fiscal year ended June 30, 1897. In the past year 419 male and 304 female scholars passed through the school. Of the former, nearly all were taught a trade as a part of their educational course. The trades in which instruction is imparted include carpentry, blacksmithing and wagon making, harness making, tailoring, tinsmithing, shoe making and printing. The aim of the management is to turn out intelligent workmen and, to this end, a very complete course of trade teaching is carried out.

The Treasury Department has issued the following official statement of the average prices of farm products in the United States in 1897, with comparisons for the three previous years:

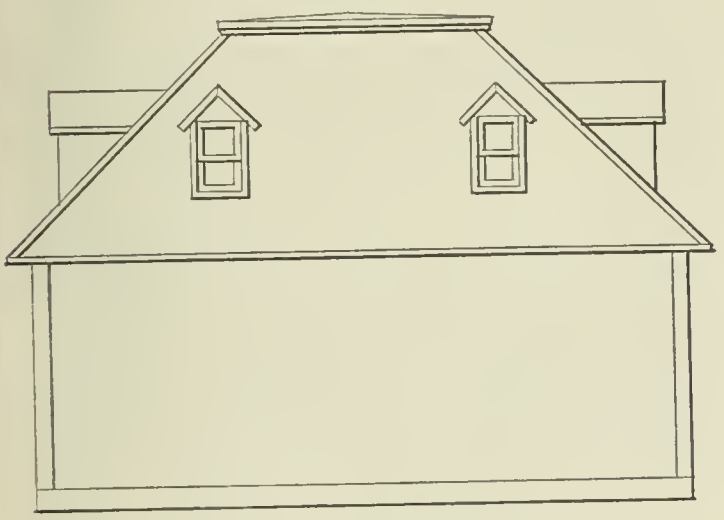
	1897.	1896.	1895.	1894.
Wheat	....	72.7	53.2	49.8
Corn	26.5	21.4	26.7	45.6
Oats	21.5	18.5	20.5	32.9
Potatoes	....	23.7	28.8	55.5
Cotton	....	6.6	7.59	4.9
Rye	44.7	40.3	43.7	50.5
Barley	37.7	32.2	35.4	44.3
Tobacco	....	6.0	6.6	6.7
Hay	$6.65	$6.54	$9.38	$8.35

The Department of Agriculture is arranging for experiments to be made at the agricultural experiment stations with the use of steel tracks on ordinary roads. The idea, which has been pushed forward by General Roy Stone of New York, is to have a steel track about 8 inches wide laid in the place where ruts are now found in most roads. This track, as proposed by General Stone is in the form of a steel trough, bottom up, with suitable joints and a small lip to guide the wheels. It is 7-16 inch thick and weighs about 65 pounds to the yard. The cost per mile is calculated at $3500. Sample sections have been laid down recently in New Brunswick, N. J.; Geneva, N. Y., and Lenox, Ill.

THE LETTER BOX.

Barn Roof Sweats.

From M. B., Baraboo, Wis.—Will *The Metal Worker* please give me some light on the following subject? We have recently covered a building that is 60 feet square with hip roofs and a tin deck with steel roofing. It is used as an animal barn, and there are about 20 elephants kept in it. It is heated by a 47-inch portable hot air furnace having a galvanized iron jacket and a 30 x 30 inch square register set in the top of the bonnet. Cold air is taken in at the back from the main room, 6-inch holes being left all around the bottom of the jacket for admitting air. We had misgiving as to the sweating of the roof from our past experience, but were advised that a layer of paper underneath the steel would prevent the condensation of moisture. The steel roofing and the tin on the deck are laid on a sheathing that is tightly laid with a tongue and groove. On this sheathing there are two thicknesses of resin paper. The roof, however, has made us trouble from sweating on the under side and we would



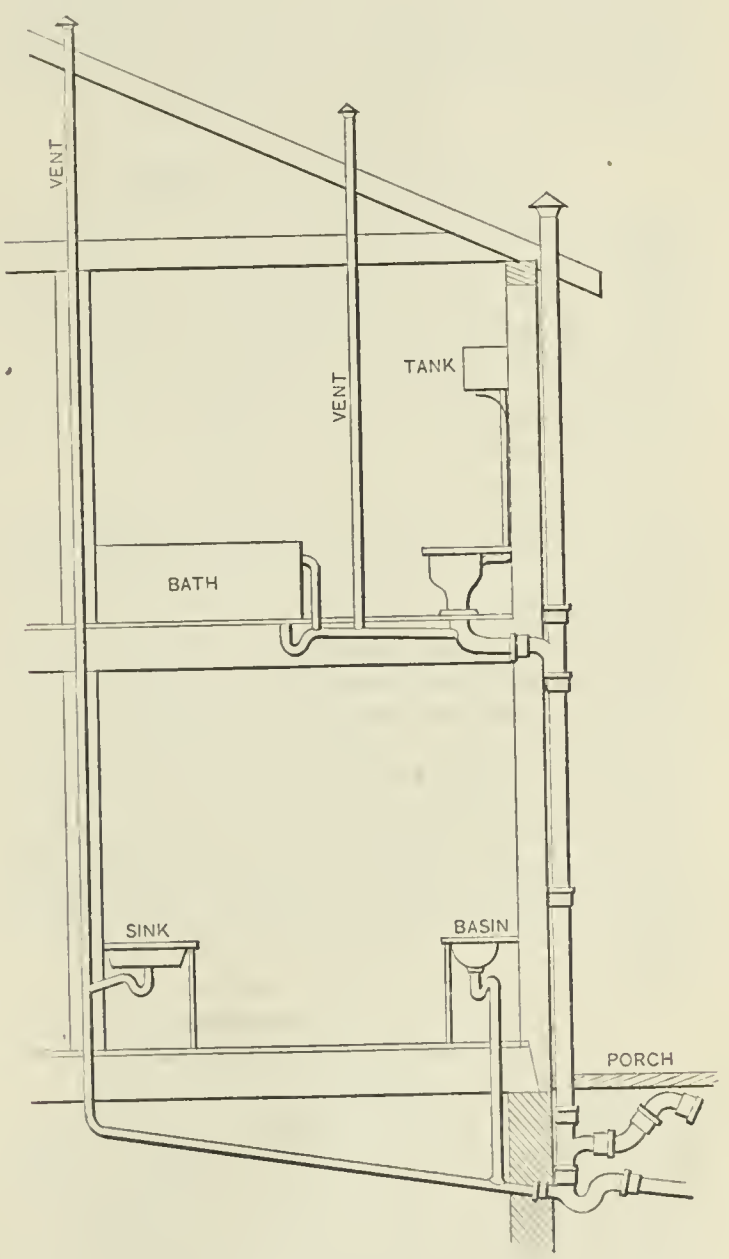
Barn Roof Sweats.

be glad to hear of a remedy for it. We submit a sketch showing the shape of the building. There are eight dormers for ventilation located about half way from the eave to the deck. The boarding on the under side is covered with condensation to such an extent that the water just runs off in a stream. Would a large ventilator placed in the deck do any good, or will we have to board up the lower side of the rafters? We would like to know what can be done with it, and think others would be interested in the problem. Would the trouble have been avoided if we had used felt roofing?

Note.—We shall be glad to have our readers who have had experience with roofing give their views on this subject. It would seem that all ordinary provisions had been made to avoid trouble from condensation. In order to solve the problem when the effect is known it is well to understand the cause. In this case the iron roofing and the sheathing on which it is laid will be considerably cooler than the atmosphere in the barn, and as a result any moisture in the atmosphere in the barn when brought in contact with the cool surfaces of the sheathing will result in condensation. In order to avoid this some step must be taken to prevent the moist air coming in contact with so cool a surface. One of the best non-conductors for a building is an air space, and it will be seen that if the rafters were provided with a ceiling of matched boarding on the under side a long step would be taken toward preventing the ceiling of the barn being cool enough to effect such a profuse condensation as is reported. If a ventilator was used in the deck as proposed it would make a very material difference in the amount of heat required in the barn. It doubtless would have the effect of carrying off the moist air. If there is a trap door in the deck this might be left partly open by way of experiment to test the efficiency of a ventilator for the purpose mentioned.

A Defective Plumbing System.

From C. R., Merced, Cal.—I submit herewith a rough sketch of a piece of plumbing work that has come under my observation. Those who did the work claim it to be



A Defective Plumbing System.

sanitary, but I differ with them in several points and would like to hear your judgment on the same. There are a bathtub, a water closet and a washstand in the bathroom, the washstand not being shown. The water closet is properly trapped. There are a sink and a wash basin on the first floor and the sink trap is vented. All of the pipes are on the north side of the house. The trap on the front wall of the house is 175 feet from the cesspool. The waste from the kitchen sink and the wash basin enters the front wall trap at the heel. The trap from the bathtub also connects with the heel of the closet lead bend. The closet

pipe is 4-inch cast iron pipe, and the waste pipe is 2-inch. Above the front wall trap is a sanitary tee and two 1-6 bends are connected with it to serve as a fresb air inlet. The kitchen door opens directly over the front wall trap. I would call special attention to the method of connecting the bathtub overflow.

Note.—To put the main soil stack on the outside of a building, and particularly the north side, would insure its freezing in some sections of the country. The method of connecting the overflow from the bathtub would allow any foul odors or disease germs which might be in the soil stack to pass into the building when the wind was in the direction to cause them to do so. It would be difficult to prevent the siphonage of the basin trap shown without a vent connection. The method of connecting the sink on the first floor and the basin with the main drain is quite as unique as the fresh air inlet arrangement, and while the method of connection is not insanitary it is a departure from what is considered the best practice. To locate a fresh air inlet so near the kitchen door would be a violation of the regulation of some cities. The overflow from the bathtub should be connected with the trap below the water line, and the vent from the trap should be connected where the overflow connection is now made. The defects which are here pointed out are sufficient to show that the system is open to a good deal of improvement.

Pipe for Water Wheel Supply.

From J. T. M., Manchester, N. H.—Will you be kind enough to give me a little information on the following question : How large a pipe is needed to supply a water wheel with an outlet of 20 square inches with a 33-foot head, so as not to have too much loss by friction ? The pipe will at one place drop 15 or 20 feet, with two elbows. The length of the pipe is about 100 feet. About how much lead should be put into a joint on a 16 or 18 inch pipe for water supply with a 33-foot head ?

Answer.—The 20 square inches outlet under 33 feet head will vary very considerably in its volume of flow by its form, or whether cut up in a number of openings, as in a turbine wheel. A narrow wheel gate, say 1 inch wide by 20 inches in length, will pass 380 cubic feet of water per minute under 33 feet head. The friction of the water in the 100 feet of pipe with two easy elbows will amount to ½ foot from the head with an 18-inch pipe, and to nearly 1 foot with a 16-inch pipe. We recommend the 18-inch pipe as the most desirable size. There is considerable difference in the socket area of cast iron pipe by different makers for the same sizes. We can only estimate for the mean dimensions at 25 pounds lead per joint for 18-inch pipe and 20 pounds per joint for 16-inch pipe, the gasket and bead occupying 1 inch in length of a socket 4 inches in depth.

The New York Convention of the National Association of Manufacturers.

The district members of the National Association of Manufacturers of the United States, consisting of Warner Miller, chairman ; Augustus G. Paine, treasurer ; Charles E. Locke, secretary ; Pliny Jewell, Benjamin Atha, Charles A. Schieren and Charles A. Moore, vice-presidents, have been in almost constant session during the past two weeks organizing for the third annual convention of the National Association of Manufacturers, which will be held in New York January 25, 26 and 27. The business sessions will be held in the Masonic Temple, corner Twenty-third street and Sixth avenue, upon the days of Tuesday, Wednesday and Thursday, January 25, 26 and 27, and upon Thursday evening, January 27. Additional committee rooms for the accommodation of the various sections of the association have been secured at the Fifth Avenue Hotel, which is near the Masonic Temple. The social headquarters will be at the Waldorf-Astoria. The night of Tuesday, January 25, will be devoted to a Bohemian Smoker, the details of which are in the hands of a committee. The banquet will probably be the largest ever given in a hotel, and will also take place at the Waldorf-Astoria on the night of January 27.

The convention committees are as follows :

Executive Committee.—Charles A. Schieren, chairman ; Seth M. Milliken, Charles T. Hughes, Frank S. Witherbee, A. R. Whitney, William F. Cochran, Henry B. Haigh, Lowell M. Palmer, William Barbour, Philip T. Dodge, Marcellus Hartley, George H. Robinson, Norton P. Otis, Edward R. Ladew, E. A. McAlpin, Frederick G. Bourne.

Finance Committee.—Augustus G. Paine, chairman ; Albert A. Pope, Stewart Hartshorn, Charles Steinway, Eberhard Faber, Allan MacNaughtan, Lowell M. Palmer, Charles E. Bigelow, Sigourney W. Fay, Jordon L. Mott, Charles E. Hauselt, Frank L. Babbott, Joseph C. Hoagland, J. Walter Spalding, William C. Beer, George F. Perkins, John Hanan, Richard Young, Charles H. Webb, Robert Hoe, Timothy L. Woodruff, E. D. Church, William A. Nash, Alfred Dolge, Robert H. Swayze, H. G. Dunscomb, George Frelinghuysen.

Entertainment and Reception Committee.—Charles A. Moore, chairman ; J. Frederick Ackerman, Ludwig Nisser, Charles H. Simmons, William McCarroll, Walter L. Pierce, Charles A. Schieren, Jr., Richard Young, H. A. Rogers, Robert W. Nelson, Frank Hooper, John Hanan, Theodore F. Miller, Thomas B. Kent, Arthur L. Merriam, C. H. Dale, Robert E. Jennings.

Banquet Committee.—William Brookfield, chairman ; R. A. C. Smith, Walter C. Gilson, Henry S. Manning, George E. Fahys, E. W. Bliss, A. Mollenhauer, H. C. Valentine, John R. Van Wormer, Richard Butler, W. O. Fayerweather, F. A. M. Burrell, Frank Squier.

Sub-Committee on Toasts and Speakers.—Warner Miller, Charles A. Moore, William Brookfield, Henry B. Haigh and Benjamin Atha.

Sub-Committee on Bohemian Smoker.—E. A. McAlpin, J. Fred Ackerman, William McCarroll, Walter L. Pierce and Edward R. Ladew.

Committee on Badges.—Frank Squier, Charles A. Schieren and Charles E. Locke.

It is expected that the most notable names among the public men of the country will appear in the list of speakers. Letters are being constantly received at the convention offices, Rooms 80 and 81 Times Building, asking for the reservation of places at the banquet. The committees are all at work and propose making the coming to Greater New York of the manufacturers of the country an event long to be remembered. It will be the first important gathering in New York after the new charter goes into effect.

In capital invested, the value of products and the number of hands employed the National Association of Manufacturers probably represents a larger aggregate than any other business organization in the world. It was formed in January, 1895, as the result of a widely existing desire for a strong and well balanced organization, thoroughly national in its character, equipped for the performance of any service which the manufacturers of the United States might require. Upon this basis the association has developed into a powerful organization, embracing in its membership upward of 1000 of the largest manufacturers' interests, representing every important industry and every prominent industrial center in the country.

The work of the National Association of Manufacturers naturally falls into groups—that which pertains to the home interests of the manufacturers of the United States, and that which relates to American trade with foreign countries. Among those objects which pertain to home interests are these: The Conservation of the Home Market, the Creation of a Federal Department of Commerce and Industry, the Improvement of Patent Laws, the Unification of Railroad Freight Classification, the Enactment of a Uniform Bankruptcy Law, the Improvement of Internal Waterways.

It is entirely without the pale of politics and embraces in its membership men of widely differing and pronounced political views.

The tariff is viewed by the association as a business problem, not as a matter of political capital, and the adjustment of the rates of duty in such a manner as to equalize the cost of imported articles and goods made in the United States represents the view of the tariff problem as held by the majority of the members of the association.

In the investigation of foreign markets, the establishment of sample warehouses, the improvement of the consular service, the restoration of the American merchant marine and the restoration of treaties of reciprocity the association aims to apply practical business methods. The plans for the foreign work of the association provide for the careful investigation of possible new markets for American products, the study of trade conditions in various countries and the ascertainment as fully as possible of the classes of American goods salable in different markets, with the conditions of competition which must be met. These agencies are designed to be warerooms for the display of American merchandise of every description under conditions that will secure the most favorable attention of the possible purchaser.

A consolidation of the gas companies of Boston, Mass., has been effected, a New York syndicate having purchased the various plants, paying about $14,000,000 for the properties.

HEATING AND PLUMBING.

THE NEW YORK TRADE SCHOOL.

The formal opening of the day classes for the seventeenth season at the New York Trade School, First avenue and Sixty-seventh street, New York, was held on Wednesday afternoon at 3 o'clock. The exercises were opened by Superintendent H. V. Brill, who introduced Wm. E. Dodge of the Board of Trustees. In his welcome to the pupils Mr. Dodge advised close application with the cultivation of correct habits in work and life and the avoidance of useless waste of time, material and thought. Such a course was pointed out as being the way to get the best that the school could give and enable the students to leave it well equipped for the business they had selected. He advised them also to prepare themselves for the responsibilities of citizenship, to study what constituted good citizenship and discharge its obligations with courage.

Edward Murphy was then introduced and recounted the high standard reached by former classes, and encouraged the new pupils to apply themselves to their work.

The school opens this year with 559 pupils enrolled, the largest number in its history. Below we give a list of the members of the Day Plumbing Class, which numbers 109, and in our Sheet Metal Department we give a list of the Cornice Class with 21 members. The evening class in electrical work this year numbers 50 members, the full capacity of the school, while 90 applications were received.

The Steam and Hot Water Fitting Class, which opens January 5, 1898, gives promise of taxing the capacity of the school, a large number of applications having been already received. The Evening Plumbing Classes have a membership of 171, the largest in the history of the school. A new course of instruction is an Evening Class in Drawing, in which pupils in the different classes can receive drawing lessons suited to their trades.

THE DAY PLUMBING CLASS.

Harry A. Ackley, Goshen, N. Y.
Frederick W. Allen, Arlington Heights, Mass.
John C. Alberts, Jersey City, N. J.
Chas. P. Bretherton, Bernardsville, N. J.
Willie H. Berry, Dryden, N. Y.
Harvey L. Benning, Wilkes-Barre, Pa.
Henry Behrens, Nyack, N. Y.
William L. Barrett, Winsted, Conn.
John D. Bell, Portville, N. Y.
Chauncy W. Brown, Ithaca, N. Y.
William L. Bull, Lenox, Mass.
John L. Bosch, Brooklyn, N. Y.
Clarence E. Clark, East Marion, L. I.
William H. Cope, Ypsilanti, Mich.
Isaac S. Collins, East Somerville, Mass.
George F. Cahill, New York City.
Dennis J. Coffey, West Winsted, Conn.
Edmond Croly, Ansonia, Conn.
Howard S. Dayton, Goshen, N. Y.
Albert S. Doremus, Goshen, N. Y.
John H. Davis, Portland, Maine.
Martin J. Duffy, Louisville, Ky.
John A. Duffy, Louisville, Ky.
Stephen A. Daunt, New York City.
Edward J. Egan, New Brighton, S. I.

William H. Youtzy, Lewistown, Pa.
George A. Ziegler, Aurora, Ill.

LAW TO PROVIDE COMPETENT BOILER OPERATORS.

In another column we print the law passed by the last Legislature of the State of New York, applying to New York City, which was designed to place the care and running of steam boilers in competent hands. The advisability of a law to provide some form of inspection of the safety appliances of heating boilers seems apparent from the bursting accidents that are reported from all parts of the country. If the care of the boiler was in charge of a competent person, and it was subjected to such inspection as a specially trained official could give, it is probable that such accidents as have been reported already this year from New England and the West would have been avoided.

When the new law for New York City went into effect (its sweeping character covering the ordinary low pressure house heating steam boilers), the preparations of the police department to carry out its provisions brought a demand for some less stringent enforcement from heating contractors and house owners. The house owner claimed he would adopt some other method of heating if he was required by law to stand the expense of a licensed engineer to run a steam boiler that had hitherto been satisfactorily run by a servant girl. The heating contractor complained that enforcement of the law would seriously interfere with his business. As a result of these complaints an opinion was asked of the Corporation Counsel of the city. On considering the provisions of the amendment with the other sections of the amended law this official gave an opinion that the law was not intended to be so sweeping in effect as to cover the cases cited in the complaints, and that the department might issue the permit given below to those who were sufficiently qualified to operate steam boilers for heating purposes.

Dated.....189 . Expires. .....189 .

PERMIT TO OPERATE STEAM BOILERS FOR HEATING PURPOSES.

ISSUED BY THE

Police Department City of New York.

PURSUANT TO CHAPTER 635, LAWS OF 1897.

This is to Certify, *that.....has been examined by .....practical Engineers (detailed as such by the Board of Police), as to his qualifications to take charge of and operate the.....* *Steam Boiler* **for Heating Purposes only,** *situate at .....and registered on the books of the Steam Boiler Inspection and Engineers' Bureau,* **SANITARY COMPANY,** *as Boiler No.....the steam pressure of which is limited by law to .....pounds, and was found qualified, and this License is granted to him only for the place and purposes mentioned.*

Examined by

.....

.....ISSUE.

.....
Sergeant Commanding Steam Boiler Inspection and Engineers' Bureau.
SANITARY COMPANY.

This License authorizes the person named herein to take charge of and operate THE STEAM BOILER MENTIONED, BUT NO OTHER, and will be REVOKED on proof of NEGLIGENCE or INSOBRIETY.

Any person operating a Steam Boiler in the City of New York without a License from the Department of Police, and any person continuing to do so after his License shall have expired or been revoked, will be guilty of a misdemeanor.

For.....

It is now reported that those who were instrumental in securing the passage of the new law are to bring an action in the courts to test the legality of these permits. It is also said that when the charter of the city of Greater New York goes into effect next year the new law of a special character will not apply. The information brought to light in the department having the enforcement of the law in charge brings out strongly the advisability of an inspection of all kinds of steam heating and cooking apparatus and some examination of those who have them in charge. The experience of New York City in this direction will be watched with interest everywhere, and it is possible that the future will find throughout the country some provision that will insure greater care and less risk in the use of steam apparatus of all kinds.

CHEAP HEATING APPARATUS.

BY A CONTRIBUTOR.

Those who have made a specialty of what was formerly called custom heating work look upon the advent of so much cheap heating apparatus as calculated to bring more harm than good to the trade. These cheap heaters are not confined to the hot air furnace trade alone, but the smaller kinds of boilers for both steam and hot water heating are being added to the lines of all the manufacturers. It is pointed out that the average man who is building a house has become imbued with a false idea of his shrewdness in buying something cheap. He is satisfied with his keenness when he refuses to profit by the explanation of the real value of a good heating apparatus, and instead accepts price alone for his guide and takes a small apparatus which may partially heat his building in mild weather. Even such heating, however, will only be accomplished by the expenditure of a great deal of care on the fire and an extravagant consumption of fuel.

With the smaller steam and hot water boilers, where the price has been the principal argument used in making the sale, it is more than likely that the mains and branches will be no larger than will just carry the minimum amount of radiation. Under excessive firing the house may be heated in ordinary or mild weather, but when the severe cold weather comes it will be impossible to secure the desired degree of heat in any of the rooms connected with the apparatus, on account of the scant radiation used. It is pointed out that in former days the gentleman who built himself a residence did it independently, and it represented to a large extent his personality throughout, and owing to his giving it his personal attention the heating received the care which its importance entitled it to, inasmuch as the health and comfort of the family for six months of the year depend very largely upon the heating plant. When this custom prevailed the heating man could readily explain the advantages of a special arrangement of the pipes and flues. This method of building, however, was supplanted by builders of the better class erecting three or four or a half dozen houses of what might be called the custom built type, and a man who desired a residence was saved all the care and annoyance of superintending his own building by buying a house of this class. Houses erected in this manner might truly be called speculative building operations, but as compared with the speculative building operations of today the term is a misnomer.

In instances where the operation will include from 50 to 100 houses a small difference on a furnace job or in a steam or hot water job may amount to a fair profit on the whole or be an item of some importance in the eye of the builder, and regardless of any superior merit the lowest bidder has been favored, creating a tendency not only to demoralize prices but to deteriorate the character of work done. As a result in many buildings a much smaller heating apparatus has been adopted and a system so cut down in its details has resulted that there is no profit in it for any who are engaged in the trade. The worst feature, without a doubt, is that the market is supplied. Neither the man who does the work nor the final owner is profited by it, and oftentimes the building operator goes to the wall in the process and all who have labored are only recompensed by the disappointment which they have reaped. When asked to suggest a remedy a somewhat cynical philosopher said : "Let the fools enjoy their

paradise, and those who have better sense will charge more, have more leisure and at least an equal amount of profit."

New York City Law for the Management of Boilers.

We print below an amendment to the statutes of New York, applying to New York City, which requires that all who run steam boilers must be provided with a certificate of qualification. This law went into effect May 22, 1897, with the approval of the Governor :

Chap. 635.

AN ACT to amend chapter four hundred and ten of the laws of eighteen hundred and eighty-two, entitled " An act to consolidate into one act and to declare the special and local laws affecting public interests in the city of New York," relative to engineers.

Accepted by the city.

Became a law May 22, 1897, with the approval of the Governor.

Passed, three-fifths being present.

The People of the State of New York, represented in Senate and Assembly, do enact as follows :

Section 1. Section three hundred and twelve of chapter four hundred and ten of the laws of eighteen hundred and eighty-two is hereby amended so as to read as follows :

Sec. 312. The board of police shall preserve in proper form a correct record of all inspections of steam boilers made under its direction, and of the amount of steam or pressure allowed in each case, and in cases where any steam boiler or the apparatus or appliances connected therewith shall be deemed by the board, after inspection, to be insecure or dangerous, the board shall prescribe such changes and alterations as may render such boilers, apparatus and appliances secure and devoid of danger. And in the meantime, and until such changes and alterations are made, and such appliances attached, such boiler, apparatus, and appliances may be taken under the control of the board of police, and all persons prevented from using the same, and in cases deemed necessary, the appliances, apparatus or attachments for the limitation of pressure may be taken under the control of the said board of police. And no owner, or agent of such owner, or lessee of any steam boiler to generate steam, shall employ any person as engineer or to operate such boiler unless such person shall first obtain a certificate as to qualification therefor from a board of practical engineers detailed as such by the police department, such certificate to be countersigned by the officer in command of the sanitary company of the police department of the city of New York. In order to be qualified to be examined for and to receive such certificate of qualification as an engineer, a person must comply, to the satisfaction of said board, with the following requirements :

1. He must be a citizen of the United States and over twenty one years of age.

2. He must, on his first application for examination, fill out, in his own handwriting, a blank application to be prepared and supplied by the said board of examiners, and which shall contain the name, age and place of residence of the applicant, the place or places where employed and the nature of his employment for five years prior to the date of his application, and a statement that he is a citizen of the United States. The application shall be verified by him, and shall, after the verification, contain a certificate signed by three engineers, employed in New York city, and registered on the books of said board of examiners as engineers working at their trade, certifying that the statements contained in such application are true. Such application shall be filed with said board.

3. The following persons, who have first complied with the provisions of subdivisions one and two of this section, and no other persons may make application to be examined for a license to act as engineer.

a. Any person who has been employed as a fireman, as an oiler or as a general assistant under the instructions of a licensed engineer in any building or buildings in the city of New York, for a period of not less than five years.

b. Any person who has served as a fireman, oiler or general assistant to the engineer on any steamship, steamboat or on any locomotive engine for the period of five years and shall have been employed for two years under a licensed engineer in a building in the city of New York.

c. Any person who has learned the trade of machinist, or boiler maker or steam fitter and worked at such trade for three years exclusive of time served as apprentice, or while learning such trade, and also any person who has graduated as a mechanical engineer from a duly established school of technology, after such person has had two years' experience in the engineering department in any building or buildings in charge of a licensed engineer, in the city of New York.

d. Any person who holds a certificate as engineer issued to him by any duly qualified board of examining engineers existing pursuant to law in any State or Territory of the United States and who shall file with his application a copy of such certificate and an affidavit that he is the identical person to whom said certificate was issued. If the board of examiners of engineers shall determine that the applicant has complied with the requirements of this section he shall be examined as to his qualifications to take charge of and operate steam boilers and steam engines in the city of New York, and if found qualified said board shall issue to him a certificate of the third class. After the applicant has worked for a period of two years under his certificate of the third class, he may be again examined by said board for a certificate of the second class, and if found worthy the said board may issue to him such certificate of the second class, and after he has worked for a period of one year under said certificate of the second class he may be examined for a certificate of the first class, and when it shall be made to appear to the satisfaction of said board of examiners that the applicant for either of said grades lacks mechanical skill, is a person of bad habits or is addicted to the use of intoxicating beverages he shall not be entitled to receive such grade of license and shall not be re examined for the same until after the expiration of one year. Every owner or lessee, or the agent of the owner or lessee, of any steam boiler, steam generator or steam engine aforesaid, and every person acting for such owner or agent, is hereby forbidden to delegate or transfer to any person or persons other than the licensed engineer the responsibility and liability of keeping and maintaining in good order and condition any such steam boiler, steam generator or steam engine, nor shall any such owner, lessee or agent enter into a contract for the operation or management of a steam boiler, steam generator or steam engine, whereby said owner, lessee or agent shall be relieved of the responsibility or liability for injury which may be caused to person or property by such steam boiler, steam generator or steam engine. Every engineer holding a certificate of qualification from said board of examiners shall be responsible to the owner, lessee or agent employing him for the good care, repair, good order and management of the steam boiler, steam generator or steam engine in charge of or run or operated by such engineer.

Sec. 2. This act shall take effect immediately.

The San Francisco Plumbing Ordinance.

We have just received from John L. E. Firmin, secretary of the Association of Master Plumbers of San Francisco, a copy of the proposed plumbing ordinance for that city, and also some newspaper comments by those who are opposed to it becoming a city law. On an examination of the ordinance and comparing it with the ordinances in effect in other cities of the first class, we find that the provisions are similar. The variations in this ordinance are such as to conform to local conditions and to relieve it of what might seem harshness to the owner of old buildings if all of the desirable requirements were incorporated and rigidly enforced. We learn that final action on this ordinance by the local authorities has been deferred for one month in order that those who will have to pass on it will have ample time to become informed as to the advisability of its various provisions and to make such changes as may seem necessary in the interests of the people without detracting from its value as a sanitary measure. It is possible that some little advantage would be gained by the San Francisco plumbers if they would select from their files of *The Metal Worker* the copy of February 20, 1897, in which interesting examples of defective plumbing are illustrated by reproductions of charts showing cases of defective plumbing that were actually found in Massachusetts, and also showing pictures of parts of plumbing systems exhibiting defects which, if not explained, would pass unnoticed by the average citizen of intelligence.

Major J. B. Fish, superintendent of the Providence Gas & Water Company, Scranton, Pa., has just completed a commodious and convenient block in the rear of Bright's wagon works for the use of his increasing business. The building is two stories high with a well lighted basement, besides spacious rooms for storing a large stock of plumbing materials and for the use of his machines. It contains two sets of pleasant and comfortable living apartments. The design is that good men in his employ with their families shall occupy these rooms, and in that way the company will always have available help in emergency cases such as are likely to occur with plumbers and water companies.

Chicago Master Plumbers.

The Chicago Master Plumbers' Association has decided to hold its annual ball and reception on Tuesday evening, January 25, in Medinah Temple, corner of Fifth avenue and Jackson boulevard. The annual election of officers will be held at their next regular meeting, which takes place on the 28th of this month. Indications point to the election of the veteran J. J. Wade to fill the honorable and highly responsible position of president. Mr. Wade has a national reputation, and his selection for this office would doubtless be greeted with much pleasure by his many friends in the country at large.

The Water Seal Automatic Air Valve.

In the accompanying illustration we present a transparent view of the water seal automatic air valve which is being put on the market by the Judson A. Goodrich Company, 120 Beekman stret, New York. This valve is

The Water Seal Automatic Air Valve.

said to successfully overcome all the troubles that have heretofore arisen with the use of air valves. The construction is readily understood from the engraving. A flotation cup is provided in connection with a specially made expansion piece, so that it will close as a result of either expansion or flotation. The special feature of the valve is the diaphragm provided in the nipple which connects with the radiator and a pocket in the lower part of the valve into which this diaphragm extends downward. This compels the air and steam expelled from the radiator to flow through the upper passage only, and allows the water to return to the radiator through the lower passage, thus preventing conflicting currents. By this means the valve does not spit, sputter or sizzle water. Another feature is a plug in the bottom which may be removed for inserting a new expansion piece or cleaning the valve. The valve may be taken apart without removing it from the radiator, so that its parts may be readily cleaned, repaired or renewed. It will be seen that the construction obviates the necessity of a drip pipe.

John J. Ellis, 47 years old, a master plumber, died at his home, 1477 Lexington avenue, New York, Friday, December 12. Cancer of the stomach was the cause of his death. Mr. Ellis was born in Ireland, and came to this country when 12 years of age. He served his apprenticeship, and finally began business for himself. He was a member of the Master Plumbers' Association and other organizations. He leaves a widow and three sons.

NOTES.

Farquhar Brothers, tinsmiths, gas fitting and plumbing contractors and stove dealers, opened their new $10,000 building, at the corner of Barrington and Blowers streets, Halifax, N. S., on December 6, when hosts of their friends called and were shown over the commodious four-story structure. The building is of pressed brick with freestone trimmings and occupies a fine situation. It is 36 x 46, with a goods entrance on Blowers street near the elevator. The shop has a fine, high, oiled wood ceiling. In the rear is the office. On this floor are shown Favorite and Royal ranges, heaters, base burners, kitchen furniture of all kinds, gas and electric fixtures and combination fixtures of the firm's own manufacture, samples of the kind of work they can do in this line. The second floor is used for a show and store room, where goods will be kept while not in season. On the third and fourth floors are the tinsmith, plumbing and gas fitting workshops. The firm consist of James and Robert Farquhar.

President John E. Dugan of the Master Plumbers' Association of Albany, N. Y., informs us that the annual meeting was held in the rooms of the association in the Degraaf Building on Tuesday, December 7, when the following officers were elected: President, John E. Dugan; vice-president, Frank F. Schimpf; recording secretary, Joseph A. Stahl; financial secretary, John J. Bridt; treasurer. J. Edward Jones; trustees, William H. Van Loon, Charles Kanzelmyer and Adam Roos.

Texas Plumbing & Electrical Supply Company have been incorporated, with principal office at San Antonio, Texas, and branches in Austin, Waco, Fort Worth, Dallas, Houston and Galveston. The capital stock is $20,000, and the purpose is to do a general merchandise business. The incorporators are John E. Martin, N. Y. Petrich and William Martin, all of San Antonio.

C. F. Roetzel of Rockport, Ind., has bought out the Davis & Cakes Heating & Ventilating Company in Sycamore street, Evansville, Ind. The style of the new firm will be the National Heating & Ventilating Company.

Wm. H. Gallagher has been appointed Plumbing Inspector at Port Richmond, Staten Island, N. Y.

We have received from the Keystone Boiler Company, Huntingdon. Pa., a circular of their Keystone boiler, which is made of copper and cast iron. The construction is such as to present a large fire surface and give a horizontal return flue. The boiler is made in four sizes, adapted for both steam and hot water. The company report good sales of these goods, and that they are contemplating an enlargement of their plant to meet the demand. They also issue a hanger showing the details of the construction by several illustrations.

J. A. Campbell & Co., Washington avenue, New Haven, Conn., have recently made a substantial improvement in their store by extending the show windows out to the front line and making a fine display of plumbing goods in them. The firm are well supplied with contracts at the present time.

President S. E. Dibble of the Builders' Exchange, New Haven, Conn., is using every effort to increase the interest in the meetings held by the builders at noon every day.

The Foskett & Bishop Company, New Haven, Conn., and New York, have recently secured a number of contracts in New York City. Among them is an office building for Leo True on Great Jones street, a large apartment house for Irons & Todd, the Scotch Presbyterian Manse on Ninety-sixth street and the new school building No. 12.

Murray & Maher have the plumbing and the Hopson & Chapin Mfg. Company the heating contracts for Architect Dudley Donnelly's new residence on Ocean avenue, New London, Conn.

The plumbers' strike which has been in existence in Worcester, Mass., for some three months past has been settled. The trouble was over the number of apprentices or helpers hired in the different shops. The basis on which the settlement was effected is not disclosed.

O'Brien Brothers have bought out the stove and plumbing business of O. C. Knox on Exchange street, Chicopee, Mass.

Under the provisions of the gas fitters' law at Boston, Mass., it is urged by some that old fixtures in which the gas key may be turned so far around as to be turned on be condemned, and fixtures of the modern type with stops be provided in their place.

Donahue Brothers, Springfield, Mass., have been awarded the plumbing contract for the Convent of the Sisters of the Good Shepherd.

George A. Sanders of Laconia, N. H., has been awarded the contract for heating the hospital building of the Cottage Hospital Association and also the plumbing and heating of the Rhoda C. Ladd house.

T. S. Wilcox has been awarded a contract for plumbing the new police headquarters or city jail at Chattanooga, Tenn.

The plumbing establishment of Lee & Foley, Concord, N. H., was recently visited by fire.

The Water Board of Albany, N. Y., has come out in favor of good plumbing, making a rebate in the charges to those who have put their plumbing fixtures in first-class order or have put in a system of an improved type.

The Indianapolis Plumbing Company have been incorporated at Indianapolis, Ind., with a capital of $1000, by E. Steinhausen, C. F. W. Koeper and Leo Holtzman.

The Metal Worker acknowledges the receipt from President Cullotin of the National Association of Master Plumbers, Revere House, Chicago, of a new revised list of manufacturers and jobbers who have signed and are now in accord with the Baltimore resolutions. With the list comes a sheet containing several addresses of those who have come in accord with the resolutions since the printed list was completed.

The Pecora Paint Company, S. Bowen's Sons, successors, Philadelphia, Pa., are distributing various cards showing samples of the colors which they are prepared to supply. Reference is made in a circular which has also been sent out to the Pecora asbestos furnace cement; Pecora egg shell gloss enamel, used as a finishing paint for engines, tools and general machinery; Pecora Dresden machine finish, for radiators, steam pipes, tanks, &c., and Pecora iron filler, for making rough castings smooth, filling all irregularities and giving a smooth, level and even surface on which to apply their steel color mineral paint.

Clifford Schlemmer, 109 Beekman street, the New York representative of Oliver Schlemmer, Cincinnati, Ohio, left this week for a visit to Philadelphia, Baltimore, Washington and Pittsburgh *en route* for home to spend the Christmas holidays. On his departure Mr. Schlemmer left with *The Metal Worker* the necessary materials for making a smoke test of a pleasing nature.

We have received from the Richmond Stove Company, Norwich, Conn., a list of 40 heating contracts, which have recently been closed by their customers in various sections of the country, eight of which are for the Richmond Hot Air Furnaces, 15 for Hot Water Heaters and 17 for Steam Boilers. Among the prominent contractors handling these goods are Webster & Meathe, Detroit; Allen Black & Co., Minneapolis; the Smith & Abbott Company, Portland, Maine; James Donovan, Middletown, Conn.; J. J. Smith Plumbing & Heating Company, Cleveland, Ohio, and W. H. Buckley & Co., Burlington, Vt.

George I. Roberts & Brother, 471-473 Fourth avenue, New York City, are issuing in pamphlet form the Engineers' Law for the Greater New York, which requires that all who run steam boilers within the city limits shall pass an examination and receive a certificate of their competency for such work. The cover page states that they are prepared to furnish Engineers' Supplies for steam, gas, water and electric work. The inside of the first cover page shows the improved Utility Pump Governor. The last page shows the Roberts Combination Exhaust Muffler, Oil Separator, Return Tank and Pump Governor.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until January 7 for a low pressure steam heating and ventilating apparatus for the United States Post Office at Pueblo, Col., in accordance with the drawings and specifications, copies of which may be obtained from the Supervising Architect at Washington or from the Superintendent at Pueblo.

We are advised by the Detroit Stove Works, Detroit, Mich., that the report in circulation that they are bringing out a new Steam Boiler and Hot Water Heater for house heating is without foundation.

The Day-Ward Company, Warren, Ohio, send us a circular of their new Champion Instantaneous Water Heater, which they say is meeting with a good sale and giving satisfactory results. They will have a larger size on the market soon, and will be glad to furnish the trade circulars and information in reference to the Heaters, and also in reference to their line of Steel Clad Bathtubs.

The Indian Head Cotton Mill, at Cordova, Ala., is having a plumbing system installed by Thomas Hyde of Albany, N. Y., in which his patented system of ventilation for plumbing is being provided. This system provides a continual flow of air out from the building through the plumbing fixtures.

The Dover Machine works, Dover, Del., are installing the heating system in the State House, and are heating the Methodist Episcopal Church at Seaford and the residence of J. Rogers at Frederica.

The Decatur Cornice Works, Decatur, Ill., are just issuing a circular showing half-tone engravings of a handsome Radiator and Register Shield designed to prevent the discoloration of walls and ceilings by deflecting the rising air currents, so that the fine particles of dust fall before they can be deposited where their accumulation is disagreeable.

We have received from the Buffalo Forge Company, Buffalo, N. Y., a pocket edition of their general catalogue devoted to mechanical heating, ventilation and drying, showing illustrations of the various apparatus and containing tables and data of value to the engineer.

Golpin & Runyon, Binghamton, N. Y., have contracted to heat the residence of Joseph Bromley with a No. 4 Empire Hot Water Heater made by the Thatcher Furnace Company.

Fred D. Johnson & Co., 80 Centre street, New York, are just issuing a new catalogue of the Frontier improved Radiator Valves made by the Frontier Iron Works, Detroit, Mich., for which they are the general sales agents. The catalogue consists of 24 pages, showing illustrations and giving prices and dimensions of steam and hot water Angle and Corner, Quick Opening Globe and Gate Valves for radiators. Horizontal, vertical and angle Check Valves are shown and some specialties in Gate Valves.

Plumbing Inspector F. W. Tower of Springfield, Mass., gave a lecture on "The Theory of Plumbing Practice" in that city on December 14. Mr. Tower demonstrated a part of his lecture by using a ram with a glass chamber.

George P. Kirtley, Ed. Farley, E. Doherty and John Sharp are a committee from the Master Plumbers' Association of Kansas City, Mo., who are endeavoring to secure the passage of an ordinance to provide an assistant plumbing inspector.

L. E. Faison has opened a plumbing shop at Waycross, Ga.

John Collins has opened a plumbing establishment at Howe and Main streets, Passaic, N. J., and is making a fine display of sanitary apparatus. He is now engaged in plumbing St. Mary's Hospital.

Thos. S. Wilcox, the well-known plumber, Chattanooga, Tenn., will soon merge his plumbing business into a plumbers' supply establishment. Mr. Wilcox contemplates the erection of a three-story building near his present establishment, and will organize a plumbing supply house to handle plumbers' supplies both wholesale and retail.

Q. S. Backus & Co., successors to the Backus Mfg. Company, Williamsport, Pa., have issued from the press a catalogue of oblong shape illustrating and describing the Backus Patent Portable Steam Radiators for gaseous fuel. The Backus heater is referred to as "a miniature steam plant, combining in one piece a highly ornamental steam radiator in the form of a mantelpiece or tiling to fit into an ordinary mantel and fire place with logs." The upper log contains sufficient water when vaporized to fill the radiating surface surrounding it, and the lower log is a peculiarly constructed burner in which gas is consumed, the flame coming in contact with the boiler or upper log, igniting the asbestos fibers on it and producing an appearance of burning wood. The device is referred to as efficient, economical and healthful, and a long list of testimonial letters are presented to substantiate the claims made for it. Directions for connecting the heater are given together with illustrations of various varieties which are offered the trade.

John F. McCartney, Inspector of Plumbing of Worcester, Mass., was presented with a gold shield, emblematic of his office, at the quarterly meeting of the Massachusetts Association of Plumbing Inspectors held in Boston December 10.

The plumbing firm of Prince & Rausch, at Wabash, Ind., have been dissolved, James Prince retiring and Charles Rausch continuing the business. Mr. Prince will soon open an establishment, in which he will conduct a Grate and Mantel business in the same city.

John Ring, the journeyman member of the Board of Examining Plumbers of Cincinnati, Ohio, has resigned, and his successor will be appointed at the January meeting of the Board of Aldermen.

A new catalogue is received from Curtis & Curtis, Bridgeport, Conn., in the interest of their Forbes patent Die Stock for cutting and threading pipe by hand and by power. The first page is an introduction calling attention to the quality of their goods, which are already well known in the trade. The first two illustrations show machines designed for working pipe from ¼ to 6 inches in diameter by hand power. A list is presented of these machines, giving their capacity and weight from 138 to 750 pounds, together with prices. These are followed by illustrations of machines for hand and power and of machines

adapted for power alone. Another specialty is a pipe threading attachment for ordinary machinists' lathes. Three pages of the book are taken up with Nipple Chucks, Pipe Cutters, Ratchet Die Stocks and Pipe Vises, one of the Pipe Vises being adapted for carrying in the pocket, weighing but 3¼ pounds and capable of handling pipe from ⅛ to ¾ inch. The cover page presents the expense of cutting pipe by hand, as compared with the same amount of pipe cut with one of the machines, showing a balance in favor of the establishment which possesses the machinery.

Pittman & Dobree, Nashville, Tenn., have purchased the tinning and plumbing business of A. M. Notgrass.

Announcement is made in our advertising columns by the New Jersey Blower Company, Newark, N. J., that they have arranged with J B. & J. M. Cornell, Twenty-sixth street and Eleventh avenue, New York, for the manufacture and sale of the New Jersey Steel Pressure Blowers and Exhausters. The apparatus have already won a standing for foundry and blast furnace work and the firm will make a specialty of their introduction into the heating, ventilating and drying field.

Examining Milwaukee Plumbers.

Sixty master plumbers presented themselves for examination before the Milwaukee, Wis., Plumbing Commission on Friday, December 10, and 67 more were examined on Saturday for the purpose of securing certificates of competency to practice their trade. The list of journeymen plumbers who were examined on Monday and Tuesday included 168 names. The following printed instructions for the guidance of the applicants for the examination were distributed among them :

"Take the seat assigned to you and keep it during the entire examination.

"The 'identification sheet' and the 'identification envelope' you find on your desks are marked with the same number. This will remain your 'examination number' during the whole examination. Report immediately if the numbers on the sheet and envelope are not alike.

"Sign your full name upon the identification sheet, place the latter in the identification envelope, and seal it immediately.

"Do not write your name on any other envelope or paper used during the examination.

"Write your answers plainly immediately after each question.

"No applicant is permitted during any examination, in any manner whatever, to give assistance to any other applicant, or to receive assistance from any other person whatever, or to communicate with any person or to leave the room without a guard provided by the examiner or his assistant.

"As soon as you have answered all questions and performed all the tasks as far as you are able to do so, place all the sheets in the larger envelope marked with the same number as your examination paper and seal them up.

"After you have finished the work and complied with the above instructions, deliver to the chief examiner or his assistant, when passing out : (*a*) The identification envelope containing the identification sheet, sealed. (*b*) The large envelope containing the examination sheets with your answers and diagram sheet sealed.

"A violation of the rules will exclude the offender from the examination and from the eligible list.

"Journeymen plumbers will retain the tag with their examination number and attach same to their sample of plumbing work in the afternoon when completed."

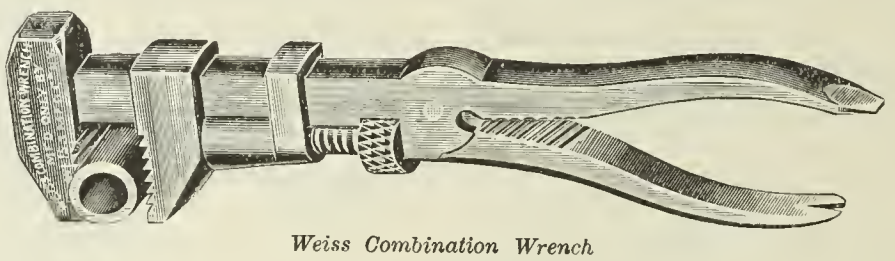
The journeymen plumbers were required to provide themselves with furnaces, soldering pots, wiping tools and other plumbing tools and material, and they were required to demonstrate their ability to do a plumbing job at the Central Police Station Building on Broadway.

The Thayer Heater Company Catalogue.

The front door of the Thayer hot water heater swinging on gold bronzed hinges forms the design for the front cover of the new catalogue of the Thayer Heater Company, Boston, Mass. The catalogue is devoted to the friction reducing Thayer heater and the friction reducing Thayer fittings. The typography and arrangement of the book are unique and attractive. After the title page is a half tone engraving of the Thayer hot water heater, followed by a novel table for comparing the virtues of furnaces, steam boilers and hot water heaters. The subject matter in the tables is discussed more fully in the pages which follow. Two pages contain quotations from the standard works on heating, among which is one from "The Metal Worker Essays on House Heating." Another section is devoted to "Ourselves," which completes the trend of the argument that the Thayer heater is a profitable investment. The few remaining pages give testimonial letters, show illustrations of the heaters and fittings and give data of interest to the heating contractor.

Weiss Combination Wrench.

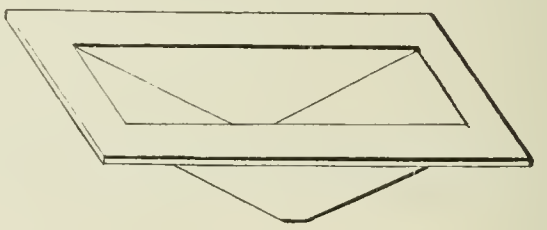
Allerton-Clarke Company, 97 Chambers street, New York, are marketing the Weiss combination wrench, here illustrated. It is 12 inches long over all, is made of drop forged steel and is designed to serve a number of purposes. It can be used either as a plain or pipe wrench and hammer. The upper of the two handles is a screw driver, the lower handle being a staple or nail puller. Wire can be cut by inserting it just to the right of the pivot on which the handle moves, while the corrugated surface seen on the handles is utilized for gripping articles as would be done with a plier. The tool may also be used as a hammer. The tool is polished and the goods are packed in wooden boxes.



Weiss Combination Wrench

The Dixon Brazing Crucible.

A newer process of brazing is threatening the old time flame method. That process is liquid brazing. Several years ago it was demonstrated that a specially treated joint, plunged into molten spelter, would not only braze in a very few seconds, but would, in addition, come out almost entirely free from scale, a brisk cleansing by a metal brush being about all the after treatment required. Briefly, liquid brazing consists merely in reducing the spelter to a molten form in a suitably shaped crucible at a high temperature, and then immersing the joint to be brazed in the liquid mass. The surfaces to be brazed are painted with a flux and the adjacent parts with an anti-flux.



The Dixon Brazing Crucible.

The Joseph Dixon Crucible Company of Jersey City, N. J., have placed on the market an anti-flux known as brazing graphite. On account of the high degree of heat required even the best of wrought iron vessels possess but a short life when used for melting spelter. To overcome this difficulty the above company have furnished several styles of graphite bowls, oblong crucibles and other special styles, but have now manufactured a crucible specially adapted for bicycle manufacturers. An outline sketch is shown herewith. It is 24 x 6 inches inside, the bottom forming an angle, being 10 inches deep in the middle. It has a 3-inch flange to support it in the furnace, and can be used in either coke, coal, gas or oil furnace. The shape makes it particularly suitable for brazing the crank hanger joints.

According to a report of United States Consul Sharp, at Hiogo, Japan, the rise in the price of commodities in that country becomes greater and greater every year. Compared with ten years ago, prices have risen 45 per cent., while wages have advanced only 39.2 per cent.

SHEET METAL WORK.

THE NEW YORK TRADE SCHOOL EVENING CORNICE CLASS.

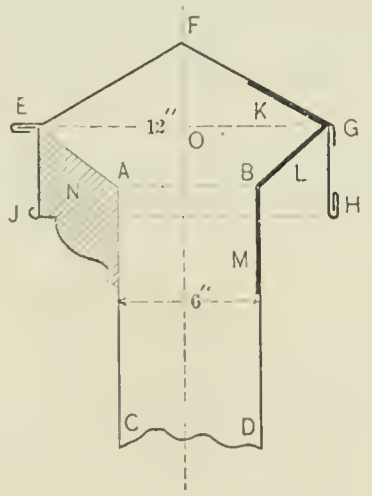
In another department we report the formal opening of the seventeenth season of the New York Trade School. We give below a list of the members of the Evening Cornice Class. This class has shown the popularity of this course of instruction by an increased membership :

Willis C. Acker, Yonkers, N. Y.
Louis Arthus, New York City.
Albert J. Becker, New York City.
Adolph Bender, New York City.
James Boyd, Jr., Brooklyn, N. Y.
John J. Brandreth, New York City.
Charles E. Brustman, Brooklyn, N. Y.
Richard H. Croad, Jersey City, N. J.
Frank Davis, New York City.
Michael Donlin, New York City.
Herman Haas, New York City.
Daniel J. Kuhn, Brooklyn, N. Y.
George W. Lindley, Brooklyn, N. Y.
William Mayer, Brooklyn, N. Y.
Albert Mitchel, Lyndhurst, N. J.
William P. Rice, New York City.
Abraham L. Ringle, Jersey City, N. J.
Jacob F. Schwoerer, New York City.
Louis Soeder, Brooklyn, N. Y.
Henry F. Soldinger, Brooklyn, N. Y.
George L. Woodburn, Brooklyn, N. Y.

PATTERN FOR PLAIN VENTILATOR.

BY W. N.

To avoid down drafts in chimneys, or smoke stacks, it is usual to place a plain ventilator or hood over them. One of the most simple forms of ventilators is shown in Fig. 1, in which A B C D is the stack, E F G the hood and G H or J E the collar placed ar ound the onter edge of the



Pattern for Plain Ventilator.—Fig. 1.—Sectional View.

hood if desired. There are two ways in making and fastening this collar.

One is to put a double edge at H, with a single seam at G and soldered, and the other, with a wire edge at J and double seamed at E. Four braces are usually employed to carry the hood, and can be made by means of band iron formed as shown by K L M and bolted, or galvanized iron stays can be used, as shown at N. The pattern for the hood is obtained by the shop rule—that is, take F G or F E as radius, and with any point, as A in Fig. 2, as center, describe the arc B C. Now set the dividers equal to E O or O G in Fig. 1, or one-half the diameter of the hood, and, commencing at B in Fig. 2, step off six spaces, as shown by B D E F G H C. Draw a line from C to A. and from A to B, which completes the net pattern for the

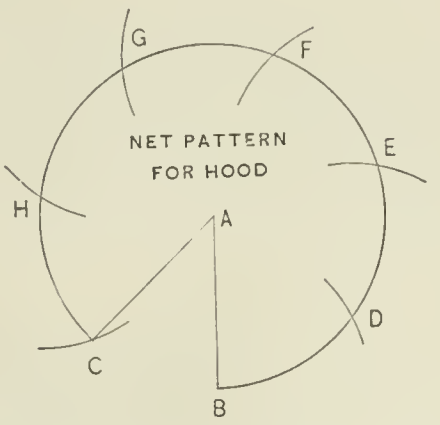


Fig. 2.—Method of Getting the Pattern.

hood. Allow for seams and edges. The size of the hood is governed by the size of the stack, the hood always being twice in diameter to that of the stack.

FLASHINGS.

The death is announced of Edward B. Lanman, manufacturer of Pressed Sheet Iron Work, Columbus, Ohio, after a short illness from pneumonia. Mr. Lanman was born at Norwich, Conn., in 1852. In 1867 he went to Columbus and entered the employment of McClune, Mithoff & Co., hardware dealers. In 1882 he started a manufacturing business of his own. At the time of his death he gave employment to 125 workmen.

The Bourlier Cornice & Roofing Company of Louisville, Ky., have been awarded the contract for the galvanized iron cornices, skylights, slate, tin and composition roofing for all the depots, section houses, round houses, machine shops and terminals, making a total of 142 buildings. The contract was made with M. T. Lewman & Co. of that city, who have the contract for the new M. & O. Railroad now being constructed between Tuscaloosa and Montgomery, Ala.

F. W. Stelling, Hartford, Conn., has in hand contracts for a large amount of metal work. He is now getting out the galvanized iron cornices, &c., for the new Walder Block, the cornices for G. Fox & Co.'s store, the galvanized iron work and ventilators for the new Hartford Brewery, and will do the tin roofing of the new car barns for the Hartford Street Railway Company on Vernon street. The latter job calls for 70,000 square feet of roofing, and is said to be one of the largest roofing contracts ever given out in New England.

The American Corrugating Company, St. Louis, advise us that they have recently added a number of improvements to their machinery for the manufacture of their American Metallic Lath, and that they are now in position to turn out all orders promptly, and that the improvements made have enabled them to double their output. We are advised that the lath made by this company comes from the machine in absolutely straight sheets, there being no curve to them whatever, thereby making it extremely easy to apply.

The Allen Anti Rust Mfg. Company, successors to Allen, Ackley & Co., 413 Vine street, Cincinnati, Ohio, have issued some interesting advertising matter relative to their Anti-Rust Japan, adapted for use on roofs and other places where it is desired to protect or preserve exposed metal work. Among the circulars which are being sent out are numerous testimonial letters from some of those who have used the Anti Rust Japan, the list including the War and Navy Departments and the Chickamauga, Chattanooga and Gettysburg National Military Parks.

TIN PLATES.

Humbert Tin Plate Company's Baltimore Works.

The tin plate plant of the Stickney Iron Company, at Baltimore, Md., recently leased for three years by the Humbert Tin Plate Company of Connellsville, Pa., was started into operation this week under the superintendency of Patrick Henry. The works are located at the southwest corner of Eleventh avenue and Clinton street, Canton, Baltimore. A track of the Pennsylvania Railroad runs into the property, and a private ferry owned by the Stickney Iron Company gives connection with the Baltimore & Ohio Railroad, cars being hauled on floats to the property. Facilities for shipment by water are also enjoyed. The plant was built in 1895, but owing to the depression in business at that time it was never put in operation. When built advantage was taken of improvements in methods of making tin plate, and the plant is regarded as one of the most complete and modern in the country. The capacity of the works is 1600 boxes of finished tin plate a week. The site of the works was formerly occupied by one of the Stickney furnaces, which was torn down to make way for the tin plate plant.

SCRAP.

A leaflet issued from the Pittsburgh agency of Wallace, Banfield & Co. of Irondale, Ohio, calls attention to the Irondale Old Style brand of Roofing Tin and recapitulates its points of merit. This Plate is coated with almost pure lead by the hand dipping process and is claimed to resist corrosion to a far greater degree than where a large proportion of Tin is used in the coating mixture.

The wash house operatives, of whom there are about 2000 employed in the Tin Plate mills dipping Terne Plates into the vats, have organized a trade union and applied for admission to the American Federation of Labor at their meeting this week, at Nashville, Tenn. The wash house men in Tin Plate works are not included in the Amalgamated Association. It is said that the majority of these workers in the Pittsburgh, Ohio Valley, Wheeling and Indiana districts have joined the new organization.

A correspondent at San Francisco, Cal., writes in regard to the Tin Plate trade of the Pacific Coast: "Tin Plate continues to come along by rail a carload at a time. There has been no arrival of foreign of any importance since my last advices. There is, of course, no special demand at this time of the year, and the market is dull."

It is reported by the Pittsburgh *Dispatch* that a large number of Welsh Tin Plate workers have come of late into that district. Owing to their familiarity with the work of Black Plate and Tin Plate manufacturing they secure ready employment. The complaint is made that in many cases where these men have been placed in charge of mills they have sent over for their friends in Wales and have made room for them by ousting American workmen. The feeling of dissatisfaction among the latter is stated to be very keen on this score. Numerous complaints are reported to have been lodged with the Amalgamated Association by men who have been forced out of employment to make room for Welshmen.

Julius A. Landsberger of the firm of J. A. Landsberger & Bro., San Francisco, Cal., is at present in the East, and will make his headquarters in New York City, care of Whitehouse & Co., 25 Broad street, until after the holidays. Messrs. Landsberger are the Pacific Coast agents for the American Tin Plate Company of Elwood, Ind.

The American Tin Plate Machine & Mfg. Company, Canal Dover, Ohio, who are running under the receiver, are turning out a special product of high grade Ternes and continuous Terne roofing. W. C. Brown, 36 La Salle street, Chicago, is Western sales agent. He reports flattering prospects for the company's Western business.

The Joint Traffic Association has announced the following change in the freight rate on sheet bars and tin plate bars: From Pittsburgh, Wheeling, Sharpsburg and Bellaire, Bridgeport and Martin's Ferry, Ohio, to Cumberland, Md., $1.15 per gross ton.

NEWS AND NOTES.

A dispatch from Victoria, British Columbia, states that between 20 and 30 river steamers are to be built at that port during the present winter. Among them is a steel steamer, which will operate on the Yukon, and also two vessels for the Hudson Bay Company.

With the view of checking the waste of natural gas which is going on in Indiana through prospecting and other operations in the oil fields, an injunction has been asked for by the State authorities against the Ohio Oil Company, who are made the defendants in the suit. This suit is regarded as a test case, and it is to be pushed to the Supreme Court with all possible haste. If a favorable decision is rendered by the court of last resort it is believed that it will be possible to stop the enormous waste of natural gas which has been going on in every part of the Indiana gas territory, to the detriment of the industries which depend upon that product for their fuel supply.

A syndicate of New York and Boston capitalists are reported to be making preparations to reopen the disused copper mines at Blue Hill, Maine. The syndicate, it is said, propose to operate these old mines, which have been idle since 1879, on a large scale. The old company who operated the mines originally were obliged to abandon them on account of the sharp competition from the Lake Superior mines.

The Westinghouse Electric Company of Pittsburgh, Pa., received last week a cablegram from Scotland to the effect that the municipality of Glasgow had awarded to them the contract for equipping the traction tramways and power houses of that city with electrical machinery. The Glasgow street railways are 70 miles in length. The Westinghouse Electric & Machine Company have also received a contract for a complete street lighting plant from Malaga, Spain.

Before sailing from New York last week on a tour of the world, George W. Vanderbilt took out a life insurance policy for $1,000,000 with the Mutual Life Insurance Company. This is by far the largest policy ever issued in the world, and it has created a vast amount of interest among insurance men.

The progress report of the Naval Construction Bureau shows that the battle ships "Kearsarge" and "Kentucky" are 49 per cent. advanced toward completion; the "Illinois," 35 per cent.; the "Alabama," 32 per cent., and the "Wisconsin," 28 per cent. The Princeton gunboat is 92 per cent. along; the submarine boat, 66 per cent., and the torpedo boats all the way from 98 per cent. in the case of the "Winslow" to nothing in the case of the three 30-knot boats to be built at Wilmington, Del., Seattle and Morris Heights, N. Y.

The receipts of the United States Post Office Department in November were heavier than those of the corresponding month in any previous year. For 50 of the large cities the gross receipts last month amounted to $3,527,868, or nearly 13 per cent. over November, 1896. This growth is regarded as an interesting evidence of the improved business conditions of the country.

Unusual activity is reported at the shipyards of Bath, Maine. Contracts have been placed within a few weeks with the local shipbuilders for 18 new vessels, with the result that the yards are busier than they have been for many years. The New England Shipbuilding Company have secured a contract to build three large barges for the Baltimore & Ohio Railroad, 200 feet long, with a capaity of 1600 tons each.

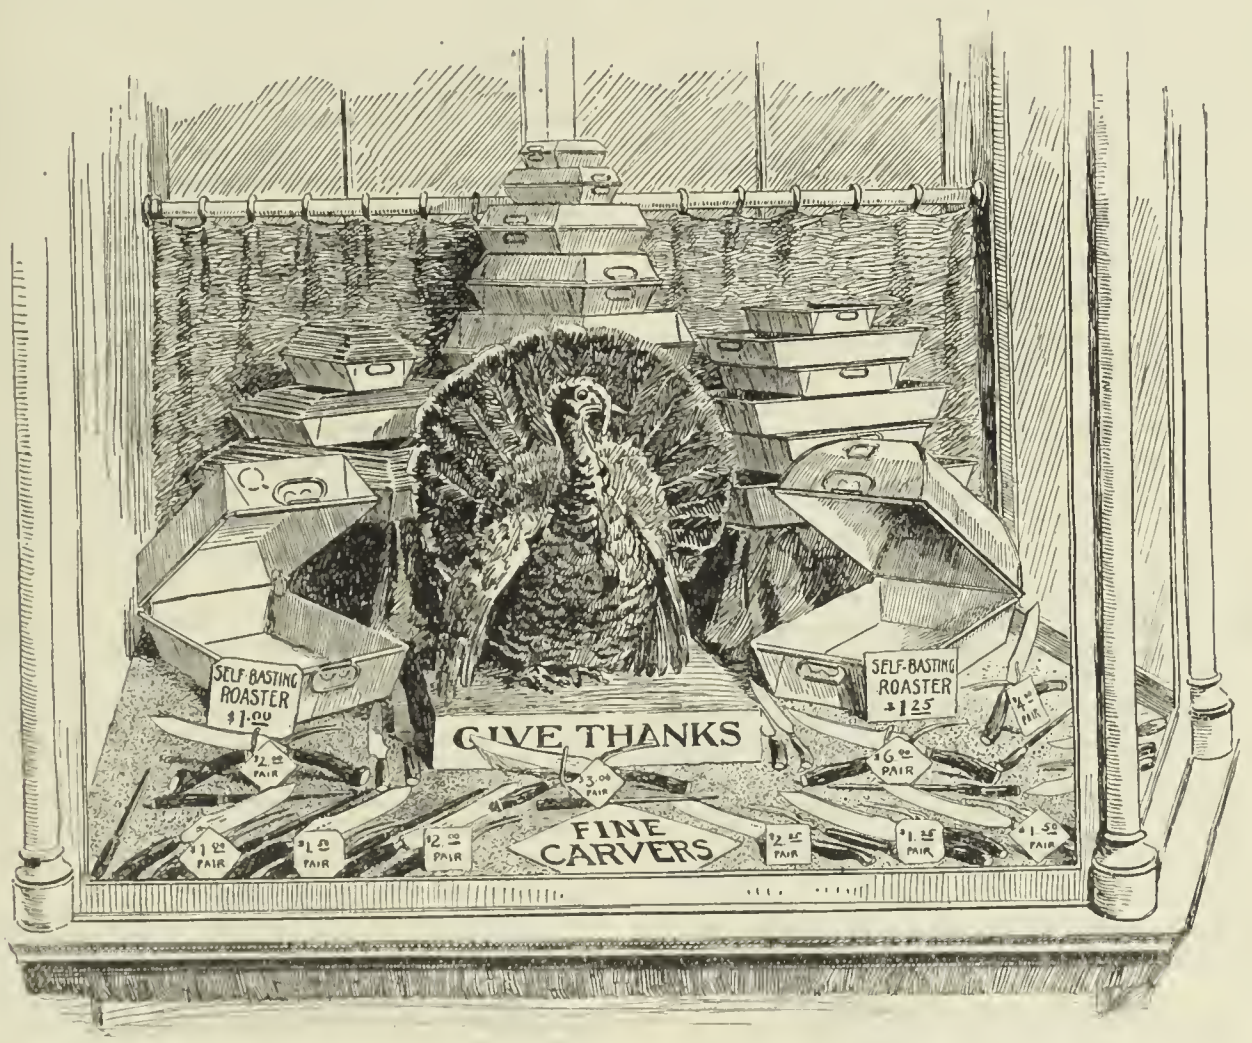
The construction of the proposed great Russian canal to connect the Baltic and Black Seas will, it is reported, be begun in the spring. The minimum water way of the canal will have a depth of 28 feet 4 inches, a width at the bottom of 116 feet 8 inches, and a width at the top of 216 feet 8 inches. Its total length is some 1000 miles, but only 125 miles will be an artificial channel. The route is from Riga along the Duna as far as Dunaburg. From that point to Lepel, on the Beresina, an expensive cut must be made. From the Lepel the course of the Beresina will be utilized as far as its junction with the Dneiper, and then the line will follow the latter stream to Cherson on the Black Sea.

THE RETAIL STORE.

Holiday Window Display.

Many retail Hardware merchants are much perplexed in arranging appropriate holiday window displays. At this time of year the temptation is stronger than ever toward placing a great variety of merchandise in the windows. This should be carefully avoided A few lines well displayed will make a much stronger impression than a great variety. Neatly lettered price tickets and window cards add materially to the effectiveness; that is, if the prices are what they should be. It is probably more important at this time of the year than at any other to change displays frequently.

The window illustrated presents a Thanksgiving display, but it is obvious that with very slight modification the exhibition may be adapted to the Christmas holidays. Securing a large turkey gobbler, the skin of the bird is stuffed and mounted, and placed in a window where the principal display consists of Carving Sets and Roasters. Any good taxidermist will mount the bird for a nominal fee. The gobbler should be placed in the center of the window, where he will show to good advantage. It is well to set him on a level plane somewhat above the floor of the window. The Carving Sets should be carefully arranged around him on the sloping floor. It is often a good plan to mark each set plainly with the price. The Roasters and Dripping Pans can be arranged to form small pyramids on each side of him. They can also be displayed from shelves and brackets upon the side walls. All the good talking points of the various articles should be brought out as strongly as possible in the display. To this end neatly lettered window signs may be employed.



Holiday Window Display.

H. L. Judd & Co., 87-89 Chambers street, New York City, have issued a catalogue which is likely to prove of interest to dealers handling brass and onyx tables and lamps, bric-a-brac stands, pedestals, &c. The catalogue is made up of 48 pages, profusely illustrated, and shows in a comprehensive way some of the many lines manufactured by this concern. In addition they turn out Upholstery Hardware, Shade and Carpet and Picture Hardware, Stationery Hardware, Brass and Iron Bedsteads, Brass Photograph Frames, Mirrors and other fancy goods, Wood and Brass Curtain Poles and Trimmings and Display Fixtures.

Challenge Refrigerators.

The handsome catalogue of the Challenge Iceberg refrigerators, issued by the Challenge Corn Planter Company, Grand Haven, Mich., gives a great deal of information both pictorially and by printed text which will interest the dealer in refrigerators. The book is oblong shape, is handsomely bound in red and contains over 90 pages, nearly every one of which is illustrated with one or more engravings of some form of refrigerator. The majority of the engravings are half tone and are beautiful presentations of the handsome line of Challenge goods. In some cases the doors are all open, revealing the interior arrangement, while in other cases the appearance of the refrigerator is shown by an outside view, clearly indicating its decorative features. Prices, brief descriptions and tables of dimensions are given with the cuts, while in the introductory pages a sectional view illustrates the design of the refrigerators, and descriptive particulars are given of its several details and features of its finish. On the front cover in a panel is printed the following : "This catalogue cannot talk. It will open up or shut up at your pleasure. It will not lie or deceive you. Photographs tell the truth. Make its acquaintance, buy the whole line and you will make no mistake."

The Adams Stove & Hardware Company of Kansas City, Mo., have been incorporated, with a capital stock of $5000, by Louella Adams, Edwin N. Adams and Louisa Adams.

The Influence of Holidays Upon the Hardware Trade.

BY C. F. C.

Hardwaremen are noting more and more the effect of the various holidays upon their business. The time was when Christmas trade in a Hardware store varied only a little from the regular run. To a great extent this was true of all other holidays as well. Today the average merchant looks for an increased trade at such times, and he generally gets it.

This change of affairs is largely due to the influence of good advertising. Then, too, the buyers have lately made greater efforts to obtain goods appropriate to the various holiday seasons. That's the old plan of backing good advertising with the right kind of goods. The right kind of advertising with the right kind of goods back of it is always remunerative.

Hardware Christmas Gifts.

There are many things in the Hardware store which make useful and pretty Christmas gifts. These things should be pushed to the front in the store and in the advertising. It pays to do it. The general public has not yet come to think of a Hardware store as a place for Christmas shopping. The best way to impress this idea is by advertising. Carpet Sweepers, Pocket Knives, Carving Sets, Skates, Silver Plated Ware, Agate Ware, Nickel Plated Goods, and many other articles of Hardware merchandise make handsome presents. At the same time those things are comparatively inexpensive. These points should be strongly brought out in the advertising.

A New Firm's Experience.

Three or four years ago a new firm purchased an old established Hardware store. The new proprietors took possession about the middle of October. They found many lines of goods badly depleted, while others were greatly overstocked. To the latter class belonged a line of Carpet Sweepers of a well-known make. One member of the firm thought that there were enough to last two years, but both members agreed that they should be disposed of in much less time. Early in November they commenced to devote their advertising space in the various papers entirely to Christmas advertising. Everything in their stock that would make a suitable present for any one was given publicity. In nearly every advertisement Carpet Sweepers were given room. On Christmas morning only two Carpet Sweepers remained in the store. In less than two months this new firm had sold more Sweepers than the old firm usually sold in a year. The average daily sales increased greatly during two weeks before Christmas. The result of the effort to get a share of Christmas patronage was so satisfactory that the firm have decided to make greater efforts along this line each year.

Frequent Window Displays.

During this period the window displays were changed frequently. There were always articles displayed which would aid and uphold the newspaper advertisements.

As it is with Christmas advertising, so it is to a great extent with other holidays during the year. At Thanksgiving time, before the Fourth of July, and during the season of any public demonstration, appropriate goods should be pushed.

Advertising Opportunities.

Perhaps there is to be some local celebration, or the local football or baseball team is to play a series of games. All such things as these give additional opportunities for effective advertising. These events should be mentioned in the advertising, and some article that is especially adapted for use on such occasions should be advertised. This plan not only advertises the store, but it advertises the event, whatever it may be. The more people that can be influenced to turn out on such occasions the more chance the merchants have of making sales.

Reciprocity.

The people who are directly interested in such events will know who helped to advertise them. This in itself is a good advertisement, for it makes friends for the firm, and out of friendship much patronage is obtained.

The window displays at such times are valuable advertisements. If there is to be a game of any sort in which a local team is to participate, trim the windows with the team colors and display articles which are useful at such times. If any society is to have a demonstration, make their emblem the central attraction in the windows. Such things attract attention, and to attract attention is the first mission of any advertising. Any firm that persists in such things as these will soon gain the name of being enterprising and public spirited. Such a reputation is an enviable one, and it pays to have it.

Outdoor Advertising.

At such times as these it often pays to use outdoor display, but it should be borne in mind that outdoor advertising, to be profitable, must be of an entirely different nature than the newspaper advertising. Outdoor advertising must be concise, that it may be read and understood at a glance. Very few details can be mentioned. Large plain lettering is a necessity. If any of the newspaper advertising must be sacrificed in order to use outdoor display it had better be left alone.

There are many different methods of outdoor publicity. As in other classes of advertising, some of these methods are better than others. For the present it will be well to mention only those which are useful during parades, ontdoor games, &c. These are almost too numerous to mention, but a few of them will not be out of place.

During a celebration of great public interest sonvenirs are good advertising. Such advertising should consist of something that is really valuable as a keepsake. Articles which are cheap and unattractive are thrown away after a glance, and remain to be trampled under foot.

In districts where the "sandwich man" idea has not been overdone this plan will pay. This person should be dressed in some unusual costume, and the advertisements which hang from his shoulders must be concise and attractive. Such a person circulating through a crowd will always be noticed.

The manufacturers of a well-known bicycle lamp have a coach built exactly like one of their lamps, which is driven about through the crowds and in front of the grand stand at race meets. Such a thing as this would be too costly for the retailer, but, nevertheless, many ideas can be derived from it. An ordinary delivery wagon, decorated with club colors, would attract attention and prove a good advertisement in most of the smaller cities. Of course it should be clean, and the firm name should not be hidden with the decorations.

A large, distinct sign permanently set upon an athletic field has its value. This value is enhanced if the sign is cared for and the wording changed when the boards need repainting. When such signs are small and huddled together with several others, much of their effectiveness is lost. White letters upon a black background stand out better and can be read further than black letters upon white. It requires a little more work to paint the former than the latter. Some persons paint the whole sign one or two coats of white, then mark out the letters, and fill in the background with black. Another plan is to lay out the letters on the boards and paint both the black background and the white letters at the same time. The latter method is much quicker, as there are no waits while the various coats are drying. In many Hardware stores such signs as these are made and painted during the dull months. If there happens to be no good letterer in the store a local sign painter should be hired to make a heavy paper stencil, with the aid of which any of the clerks can mark out the letters on the boards. When the signs are large the stencil must necessarily be in several pieces.

In outdoor advertising, as well as in any other kind of publicity, one must be careful not to "pay too much for his whistle." All advertising has value, but many merchants pay for some branches of it much more than it is worth to them.

The Projected Enameled Ware Consolidation.

The negotiations looking to the consolidation of a number of the leading enameled ware and stamping companies are still being actively prosecuted. A further meeting of representatives of these interests was held this week in Chicago. It is understood that some of the difficulties surrounding such a combination as is aimed at have been cleared away. At the same time, it is definitely stated that no actual agreement of any kind has as yet been arrived at. The whole matter is still in an embryo condition. A number of companies engaged in this line of business have been communicated with, and the project has been discussed very fully. But the interests involved are so complex that even if the proposed plan of consolidation is carried out it will take considerable time to perfect a working agreement.

Among the companies said to be considering the scheme are the St. Louis Stamping Company of St. Louis, Mo.; the Central Stamping Company of New York City the American Stamping Company of Brooklyn, N. Y.; the Bellaire Stamping Company of Harvey, Ill.; Matthai, Ingram & Co. of Baltimore, Md., and Kieckhefer Bros. Company of Milwaukee, Wis. The Iron Clad Mfg. Company and the Haberman Mfg. Company of New York are also mentioned as likely to be included in the consolidation, but neither of these firms are believed to have yet signified their willingness to join. Ex-Congressman Frederick G. Neidringhaus, president of the St. Louis Stamping Company, who is the leading spirit in the movement, returned this week to St. Louis after a prolonged visit to New York, Baltimore, Chicago and other points, in the course of which he met and conferred with representatives of all the principal enameled ware and stamping concerns

Leading officials of some of the large concerns named above who have been seen state that the idea of the consolidation of interests is not to advance prices, but to economize in the cost of production and to reduce the cost of selling their goods by marketing them through one central agency. Competition would still have to be met, as several concerns making enameled ware, among which are some of the most important, are not interested in the present project. The statement, freely made in the daily press, that the capitalization of the consolidated company would be about $25,000,000 is declared by those interested to be preposterous. At the utmost, if all the concerns whose names have been mentioned came in, the combined capital represented would hardly reach $10,000,000.

Hardware Want Book.

Simmons Hardware Company, St. Louis, Mo , will, on application, mail free of charge to any dealer in any of these lines of goods a very convenient want book, which embodies some unique features. It is 9 x 4½ inches in size, has 110 pages and a flexible cover. Opening and closing pages to the number of 15 call attention to leading features of their business, but the remainder of the book is ruled for the use of the dealer to note his wants as they occur, thus making a convenient and efficient record from which to order. At the bottom of each page are excellent business maxims. A few of them are given below:

Would it not pay me better to be in the front part of my store and mingle with my customers, instead of shutting myself up in the back office among my books ?

Is not quality remembered long after the price is forgotten ?

Was it Christian in me to keep a "drummer" waiting around all day when I could have disposed of him in 15 minutes ?

Can I continue to pay my bills promptly unless I require prompt payment from my customers ?

Wouldn't it be a good idea for me to put in goods to sell every season of the year so I will have no dull periods ?

Will the profit I lost on goods I was "out of" ever come back ?

Why should not a Hardware store enjoy a good Christmas business ? What did I carry in stock last year to sell to the Christmas trade ?

Does the special man, who gave me an extra 5 per cent. on the gross of Hair Curlers, think of me as often as I think of him ?

Would it not be just a little bit suspicious if all jobbers' prices were the same on everything ?

Ninety per cent. of all the failures in this country are caused by "credit," particularly indefinite credit.

"Slow collections" is the usual obituary notice of a failure in business.

Short accounts make long friends.

Buy what you need and nothing else, and in quantities to suit.

Go after trade and don't wait for it to come after you.

Always get your money before you spend it.

He who is most slow in making a promise is most faithful in keeping it.

When you order an extra large quantity underscore the quantity.

Violation of trust to day, lack of standing to-morrow.

To live within your income means happiness, otherwise misery.

Politeness is the cheapest capital in the world, and pays the longest dividends.

Don't kick first. Ask questions. Your impression may be wrong.

A grasp of the hand and a pleasant smile often sells a bill of goods.

Avoid promises—they are thin ice and dangerous.

Is it better for me to buy a small variety in large quantities, or a large variety in small quantities ?

Some farmers buy everything on credit, but sell all they produce for cash—"great heads."

Energy is an absolute requisite for business success.

Do your work every day—don't put off. Procrastination is the thief of time.

Don't keep your good nature down in your boots. Hang it outside where people can see it and be happy for it.

Another Chicago Hardware Sensation.

Chicago is springing surprises on the Hardware trade these days. Hardly had the discussion of the retirement of John Alling & Co. ceased when Horton, Gilmore, McWilliams & Co. concluded to withdraw from business. They decided to quit on the 7th, when, after a conference with Hibbard, Spencer, Bartlett & Co., the latter agreed to purchase the entire stock of merchandise which the former had on hand. Subsequently an assignment was made to the Illinois Trust & Savings Bank. It is stated that this peculiar course was taken for the purpose of speedily settling the affairs of the house and realizing, if possible, dollar for dollar of the indebtedness. The liabilities of the firm are placed at $210,000, and the assets at $300,000. The latter consist of $150,000 in outstanding book accounts and the sum expected to be realized from the sale of merchandise to Hibbard, Spencer, Bartlett & Co., which will be turned over to the assignees.

The business of Horton, Gilmore, McWilliams & Co. has been in unsatisfactory shape since 1893, and profits have been so small in the Hardware trade that the recovery this year could not make up the previous deficiency.

Debts have been pressing which could not be met. It was therefore decided to go into voluntary liquidation with as little trouble as possible to the members of the firm and to creditors. The sale of the merchandise to Hibbard, Spencer, Bartlett & Co., which was done on private terms, is said to promise much better results for the interests involved than if the stock should be disposed of under judicial proceedings.

This action terminates the existence of one of the oldest Hardware houses in the Northwest. It was long known as William Blair & Co., having been founded by William Blair in 1842. On January 1, 1888, Mr. Blair retired, and his partner of many years' standing, James M. Horton, organized a stock company to carry on the business under the name of Horton, Gilmore, McWilliams & Co. The new owners did a flourishing business for some years, but appear to have received a shock in the depression following the panic of 1893 from which they could not recover. The members of the firm have the profound sympathy of the trade.

The house of Hibbard, Spencer, Bartlett & Co. gains added prestige from this absorption of another rival. The wholesale Hardware trade of Chicago is now concentrated in very few hands. But while their competitors drop out of the race the business of Hibbard, Spencer, Bartlett & Co. steadily grows and their influence correspondingly increases.

C. Sidney Shepard & Co.,

Chicago, are establishing a branch house at 1408 and 1410 West Eleventh street, Kansas City, Mo., and expect to have it in running order about January 1. They will carry a full line of their own goods and a complete stock of sheet metals, enabling them to make prompt shipment on hurried orders. A railroad track extends into their warehouse, thus giving them the best possible facilities for receiving and shipping goods. The branch house is well located in all respects to handle Western and Southwestern trade.

MEMORANDA.

The Hill-Whitney Aluminum Company, 90 Canal street, Boston, Mass., manufacturers of Aluminum Kitchen Ware, will early in 1898 transfer their manufacturing department from Fair Haven, Vt., to Waltham, Mass.

William J. H. Gluck, 218-222 North Gay street, Baltimore, Md., has issued some advertising matter in the shape of circulars and a pamphlet calling attention to the extensive assortment of goods which he manufactures of interest to Stove and Tinware dealers generally. The pamphlet illustrates what are designated as spring specialties, these including Nursery Refrigerators, Gluck's New Steam Cookers, the Standard, King, May Queen and Gluck's Non-explosive Oil Stoves, all of which embody interesting features of construction; new patterns of Ovens for Gasoline, Gas or Oil Stoves offered in 26 sizes, and a varied line of Table Gas Stoves, or Hot Plates, as they are sometimes called, these being offered under such names as Liberty, Fire Queen, Star and Sunshine. Attention is also given to Gasoline Stoves and to an extensive line of Tinware, Water Coolers, Oil Radiators, Cuspidors, Fruit Cans, Coffee Pots, &c. The circulars call attention to a Christmas assortment of Gray Enameled Ware and also to the Wood Air Tight Heating Stove.

The Eclipse Cleanable Dry Air Refrigerator is the subject of a little illustrated price list issued by the Eclipse Refrigerator Works, Burlington, Vt. The main features of this construction are explained, while illustrations show its various styles and tables give sizes and prices.

Wm. Bowler has just completed the erection of a new three-story brick building at Atlantic City, N. J. The structure is 32 feet wide and 125 feet long. It is, we are advised, a modern establishment in every respect. Mr. Bowler handles a varied line, including Hardware, House Furnishings, Paints, Oils, Ship Chandlery, &c., and also conducts a plumbing and heating department.

W. C. Cowles, retailer of Shelf Hardware, Stoves, Tinware, Sporting Goods, &c., Scranton, Pa., will in March next move to a new building which is now in course of erection. The building is 24 x 70 feet, three stories and basement. It will be lighted with electricity and have other modern appointments

The Hudson Fruit Parer Company, Leominster, Mass., are putting on the market an improved parer, corer and slicer called the Daisy, which, they state, will operate successfully on large or soft fruit. The machine is described as being well made of the best materials, light and easily handled, and they state that it can be sold at a reasonable price. The fork and slicing knives are tinned so that the fruit will not turn black. The machine is illustrated in a small pamphlet which has been prepared for the hardware trade.

H. R. Brasfield & Co. will succeed H. R. Brasfield & Brother in the Hardware, Stove and Implement business in Unionville, Mo., February 1, 1898.

H. T. Boynton has decided to get out of the Stove and Tinware business in Westbrook, Maine.

Warren's Compartment Cabinet.

J. D. Warren Mfg. Company, Marine Building, Chicago, are putting on the market, in connection with their portable hardware shelving, compartment cabinets, shown herewith. The front of the compartment has a tilting

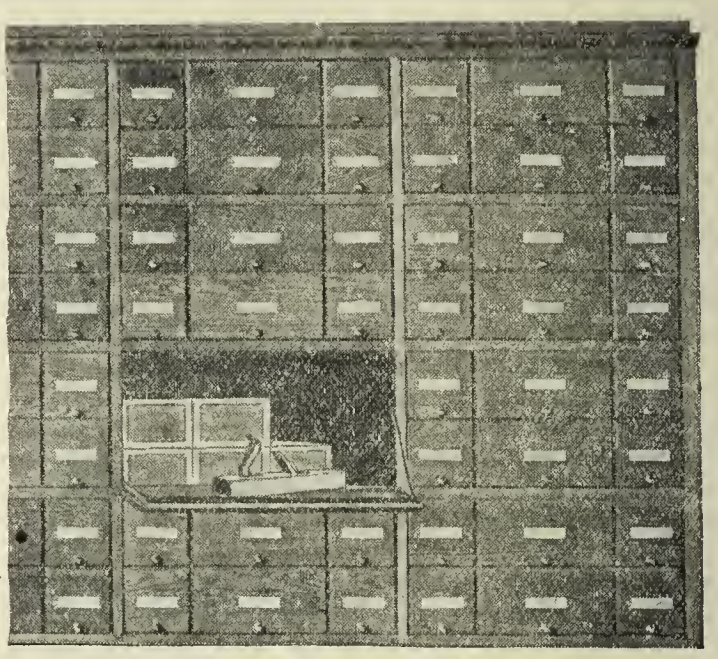


Fig 1 — Warren's Compartment Cabinet.

facing that is quickly lowered and forms a strong shelf on which goods may be shown. This arrangement is referred to as preventing mixing different goods, which, it is pointed out, occurs when placed on a counter, also having

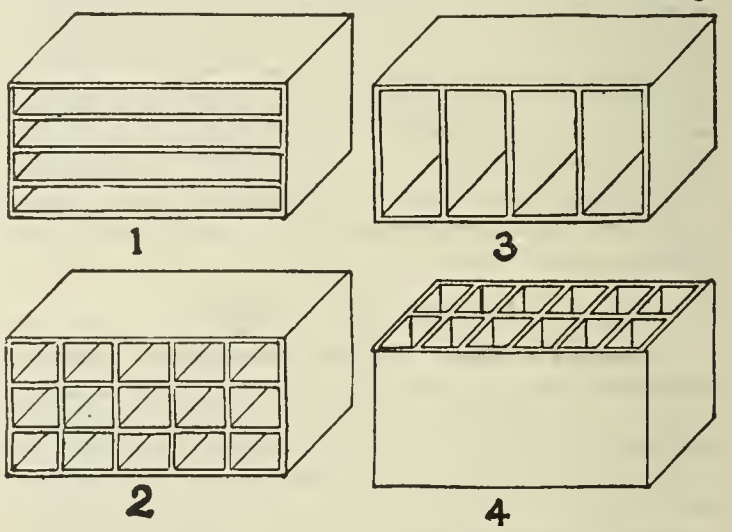

Fig. 2.—Chests for the Compartments.

the additional advantage that if the salesman is hurried any other salesman will find the goods on the shelf or in the compartment in which they belong. The cabinets were made for the convenience of merchants who wish to carry goods in the original packages so that goods of any certain kind or class may be kept in a certain space by themselves, to prevent mixing of stock and having a place for each class of goods, facilitating the finding of those goods. For instance, hammers can be carried in one compartment, hatchets in another, braces in the third, &c. The exterior of the drop shelf is finished to give the appearance of drawers, which, it is remarked, looks much richer than if the drop shelf was plain. Inside of the compartments various designed chests with pigeon holes and shelves can be placed, as shown by outlines in Fig. 2. For instance each shelf of 1 will hold 12 sizes of bits, so that 48 different sizes can be carried in one compartment, systematically arranged. Other goods can be conveniently kept separate in a similar way in this and the other chests. Cabinets with wooden drawers will be furnished if desired. The cabinets are 8½ feet in length, and of such hight that when resting on the base they can be conveniently reached from the floor.

STOVE TRADE NOTES.

TRAVELING STOVE SALESMEN FOR 1898.

The Co-operative Foundry Company of Rochester, N. Y., have arranged with the following salesmen to represent their interests during the year 1898 and to travel in the territory indicated: S. R. Sills in Western New York and Pennsylvania, C. C. Young in Central and Northern New York, George Low in Eastern New York and the New England States, H. Ganetsee in Ohio, Indiana and Michigan, C. B. Kelly in Pennsylvania, Maryland and Virginia, and J. B. Sperry in Southern Michigan.

The Walker & Pratt Mfg. Company of 31 and 35 Union street, Boston, Mass., will be represented by A. J. Holt and Arthur G. Place, who will visit the trade in the New England States.

The Howard Stove Company of Beaver Falls, Pa., will have their interests looked after by William M. Ewing, who will travel in Pennsylvania, Ohio and Indiana.

Charles C. Heath & Co. of Baltimore, Md., will be represented on the road during the ensuing year by Samuel Snyder, who will cover Virginia, West Virginia, North Carolina and Georgia, and Carey A. Moore, who will travel in Maryland, Pennsylvania, Delaware and New York.

The Somerset Stove Foundry Company of Somerset, Mass., will be represented by F. E. Grinnell and Frank W. Hawley, who will visit the trade in the New England States.

The B. C. Bibb Stove Company of Baltimore, Md., will be represented by W. H. Jones, who will cover South Carolina, Georgia and Florida; W. B. Hargrave, who will visit the trade in North Carolina, Virginia, Maryland and Delaware; and F. R. Eldridge, who will call on dealers in the cities of Baltimore and Washington and in parts of Pennsylvania.

The Mount Penn Stove Works of Reading, Pa., number among their traveling staff Ernest E. Reinking, who will cover Eastern Pennsylvania, New Jersey, Maryland, Virginia and New York; B. Frank Neudoerffer, who will visit in Western Pennsylvania, Ohio, West Virginia and New York, and George Uniacke, who will look after the trade in Philadelphia and vicinity.

The Marietta Mfg. Company of Marietta, Ohio, will be represented on the road by Alla Winsor, who will travel in a portion of Ohio, West Virginia and Maryland.

The Indianapolis Stove Company, Indianapolis, Ind., have made arrangements to have L. W. Clayton represent them in Illinois, William W. Clayton in Indiana and J. P. Lowry in Eastern Indiana and Ohio.

The Standard Stove Works of Fort Payne, Ala., will have their interests looked after the ensuing year by A. D. Atwood, who will travel in Alabama, Mississippi, Louisiana and Texas; H. C. Ryall, in the Atlantic Coast States, and B. E. Rainey, in Tennessee, Kentucky and the Middle States.

The Estate of P. D. Beckwith, proprietors of the Round Oak Stove Works, Dowagiac, Mich., have a large traveling force, which will look after their interests on the road during the ensuing year. Dyke V. Keedy will cover New York and the New England States; W. T. Leckie will travel in Michigan and Indiana; George T. Adams, in Wisconsin, Minnesota and the Dakotas; R. R. Elliott, in the State of Illinois; John L. Parker, in Iowa; Charles E. Starrett, in Kansas and Nebraska; W. N. Sawyer, in Missouri, Colorado and the Pacific Coast States; H. L. Mosher will cover Ohio and will look after special furnace work; Theodore C. Perry will also attend to special furnace work, while O. G. Beach will act as sales manager.

Hess, Snyder & Co., Massillon, Ohio, will be represented by A. L. Snyder, who will travel in Eastern Ohio and Pennsylvania, and F. E. Hess, who will cover Western Ohio and Indiana, also a part of Illinois.

The Foster Stove Company of Ironton, Ohio, will be represented by W. H. Foster, who will visit the trade in Ohio, Virginia and West Virginia; E. E. Tibbetts in Indiana, Tennessee and Mississippi, and Charles Marting in Kentucky and Tennessee.

The Rock Island Stove Company, Rock Island, Ill., have arranged with the following salesmen to look after their interests the ensuing year: A. D. Sperry, O. Leonard, S. D. Cleland, A. B. T. Moore, A. C. Colton, M. L. Morehouse and E. B. Waterman. The territory has not been fully assigned.

George W. Eddy.

George W. Eddy, at one time a prominent stove manufacturer of Troy, N. Y., died at his home in Waterford, this State, on December 5, in the eighty-seventh year of his age. He was born at Wethersfield, Vt., in 1811, and in 1830 went to Waterford, where he engaged in the manufacture of printers' ink, which had an extensive sale not only in the United States but also in Canada. Being a man of great business energy, he erected large stove works in the year 1847, where he also turned out car wheels and general machinery, and later the well-known Eddy valve and fire hydrant, of which he was the inventor. After more than 40 years of active business life, during which he gave employment to a large force of men and added greatly to the business interests of the village, he retired to private life. Mr. Eddy was not only a man of much inventive genius, indomitable energy and special business ability, but was large hearted and generous.

From the beginning to the end of the Civil War his house was noted as being the headquarters for the preparation and sending forth of supplies for the Christian and Sanitary commissions, and to this work he contributed largely. Mr. Eddy was a member of the First Presbyterian Church of Waterford and also one of its trustees.

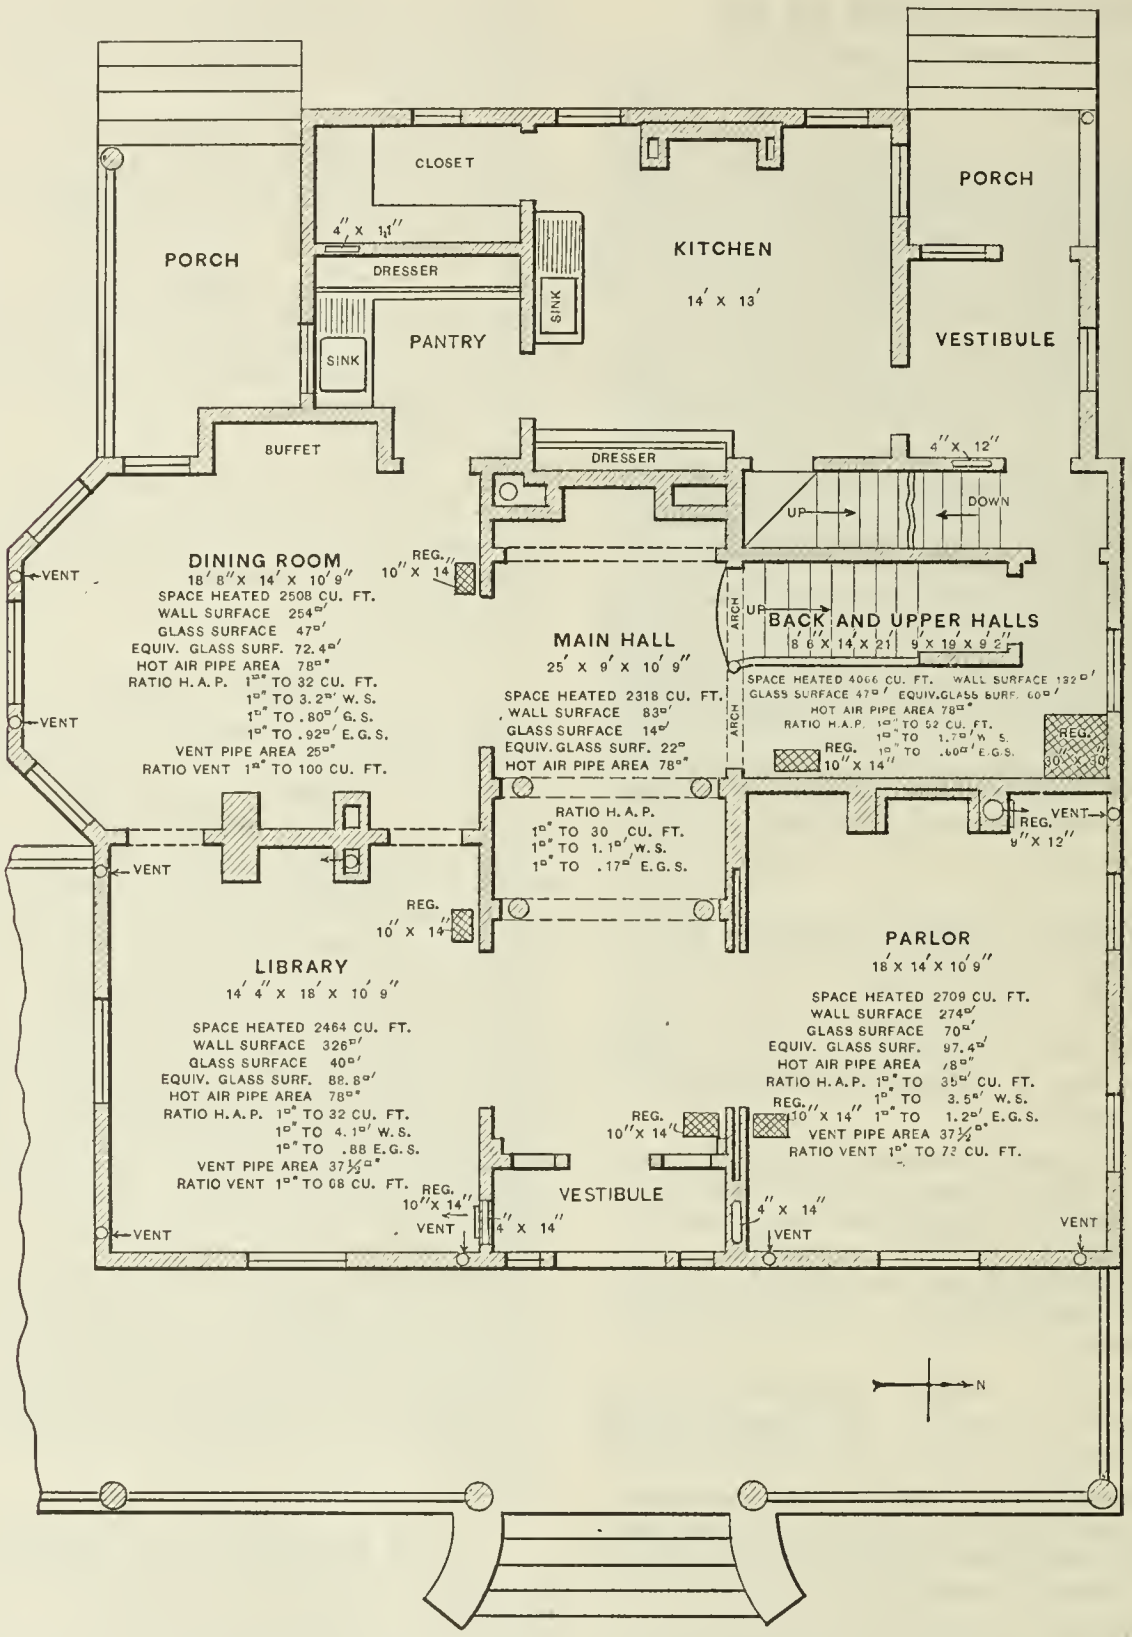
The Buckwalter Stove Company,

Royersford, Pa., have just issued a third edition of their treatise, "Heat and Ventilation," in which they also discuss the merits of their Eclipse furnaces. The principles of hot air heating are, in the treatise, expounded in a manner calculated to impress on the minds of those most ignorant of the subject the essential qualities to be looked for in a heating apparatus and their relation to health and comfort. The reader, having been shown the advantages of heating by hot air, has his attention drawn to the Eclipse Duplex, Eclipse, Eclipse, Jr., and Storm furnaces made by the company. The different parts of these furnaces are illustrated so that dealers and users can at once see the points of merit claimed for them. Under the heading "Short and Juicy Facts for Dealers" the features of the furnaces of special interest to dealers are prominently displayed and the advisability of carrying the line urged. At the end of the book is a collection of tables, a lot of information valuable to the furnace trade and numerous testimonials from users of the furnaces. The book is well printed on good paper and bound in yellow paper covers bearing a special design on the front.

A VENTILATING SYSTEM IN CONNECTION WITH A FURNACE.

During last winter there was in operation in the residence of J. P. Watson, Flatbush, L. I., a system of ventilation invented by William Willer, and used in connection with a No. 52 Thatcher furnace, manufactured by the Thatcher Furnace Company, 240 Water street, New York, who are placing this system of ventilation on the market, having secured the patent rights. It has been noted in the operation of this heating plant that the air flows readily through the pipes leading to distant rooms. This is said to be due to the fact that the air is removed from the room to make room for the incoming warm air through several 4-inch ventilating pipes connected with small registers in the base boards. These ventilating pipes run to the cellar and connect into a larger pipe used in connection with the smoke pipe of the furnace. By this means, it is claimed, the influence of the wind outside on the indoor air currents is practically overcome. It is further pointed out that in addition to the ventilation or change of air which alway accompanies the heating of any building with hot air furnaces, further ventilation and a more rapid change of air is effected by means of the exhaust ventilators.

The building in which this system is used faces due east, and the plan given in Fig. 1 shows the arrangement of the first floor, from which it will be seen that the registers used for heating are placed in the floor and the location of the exhaust or vent pipes is indicated by round pipes in the outer walls, with arrows and the word "vent" to make their location more clear. The ventilators are placed in the outer walls to remove the air which is naturally cooled by the exposure and to get it out of the room before the atmosphere is chilled and allow the incoming warm air to flow to the point of exhaust and keep an even temperature throughout the apartment. The second floor plan is given in Fig. 2, from which it will be noticed that the principal rooms are heated by means of round pipes, provision being made to secure pipes of this shape owing to the freedom with which the



A Ventilating System in Connection with a Furnace.—Fig. 1.—Plan of First Floor.

air flows through them. In the parlor chamber and library chamber there is also a 4 x 14 partition pipe brought up to aid in the heating. Partition pipes are used for heating the bathroom and the kitchen chamber. The 9-inch pipe used for heating the library chamber is reduced to 8 inches in size immediately above the top of the register and carried to two chambers in the attic. The front attic chamber is 12 x 22 x 9 feet 2 inches in hight and contains 2420 cubic feet, while the rear chamber is 17 x 9½ x 9 feet 2 inches and contains 1476 cubic feet. A damper is placed in the pipe leading to these rooms so the ash pit of the furnace. In the box a damper is placed, connected with the flap of the check draft, and in the pipe between the box and the opening in the ash pit of the furnace is a tight damper which may be closed when ashes are being removed from the fire. The chamber receives a 10-inch pipe into which the various small ventilation pipes from the rooms are connected The draft slides in the front of the furnace with this system need to be opened very seldom, as the air for increasing the fire comes into the chamber through the 10-inch vent pipe, as shown in Fig. 4, and passes down into the ash pit, by this means

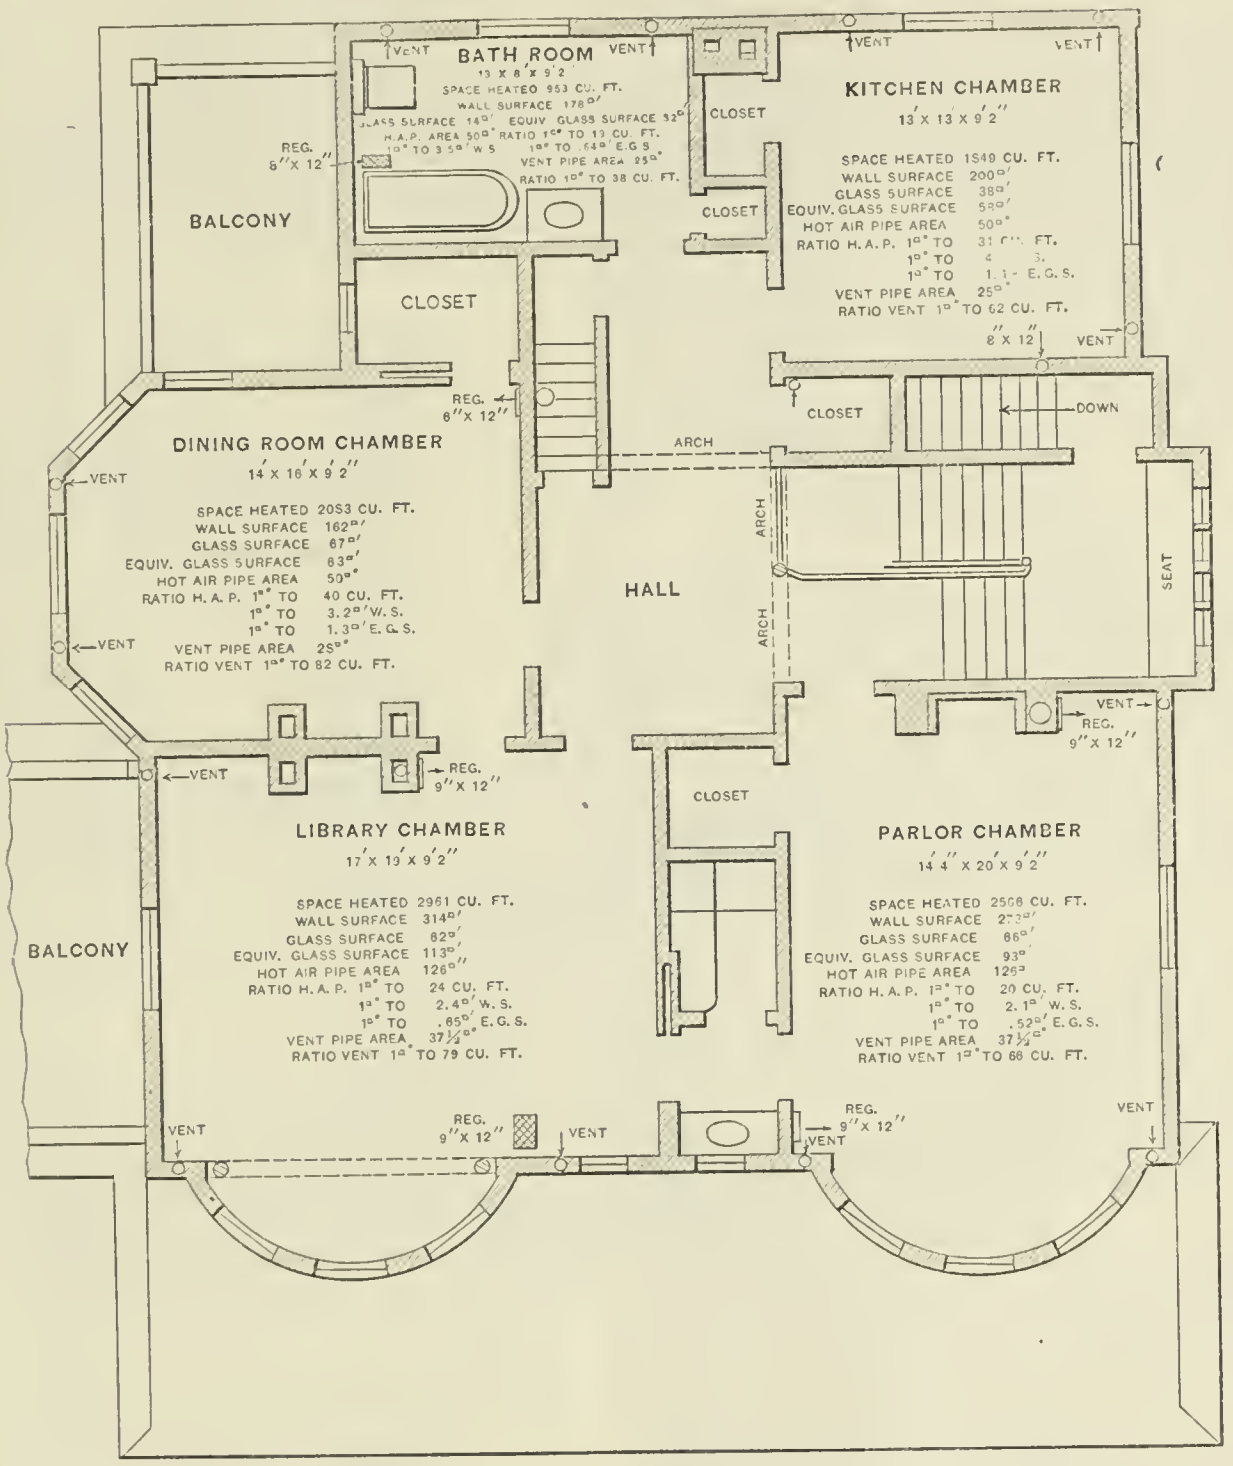


Fig. 2.—Plan of Second Floor.

that all of the hot air can be kept on the second floor when desired.

Fig. 3 is a plan of the basement showing the location of the furnace and the hot air pipes leading to the various rooms, and also the method of connecting the ventilating pipes with the furnace. Fig. 4 is a sectional elevation showing the method of connecting the return pipe from the ventilating system with the furnace and smoke pipe. It will be noticed that the smoke pipe on leaving the furnace passes through a large chamber made of sheet iron, and that the smoke pipe has a damper connected with the check draft so that when the flap of the check draft is raised a damper in the pipe is closed with the exception of an opening through which the gas may escape. It will also be seen that this chamber is connected to a box and keeping a good fire, and a strong exhaust is effected in the vent pipes. When the fire must be checked, by opening the flap on the furnace check draft the damper at the ash pit connection is closed and the air rushes into the smoke pipe, checking the fire, and through the heat of the chimney and the gases which are continually escaping a strong exhaust is effected.

The furnace is supplied with cold air through a 14 x 46 inch pipe leading from the north side of the building to a pit under the furnace. This duct is provided with a tight damper, and into one side of this duct another duct of the same size leads from a 30 x 30 inch square register placed in the floor of the back hall, as shown in Fig. 1. This duct is also provided with a tight damper. By this arrangement when a fire is started and

the building is cold the air in it may be circulated in order that the heating of the building may be more quickly accomplished. This method of supplying the furnace with air and revolving the air of the building is also available in extremely cold weather, when to take the air from out of doors would tax the heating capacity of the furnace. It will be noticed that the capacity of the cold air ducts is 644 square inches, and that the furnace has 12 hot air pipes leading from it having a combined area of 636 square inches.

ing room and dining room chamber connect into an 8-inch pipe, and the vents from the library and library chamber connect into another 8-inch pipe, these two connecting with a 10-inch pipe and running over to a 14-inch pipe which connects with the ventilating device shown in Fig. 4. The smoke pipe from this ventilating device and the furnace is 12 inches in diameter and connects with a 12 x 12 flue, a flue of this size having been provided in order to operate the furnace properly and to carry away the air returning from the ventilating system.

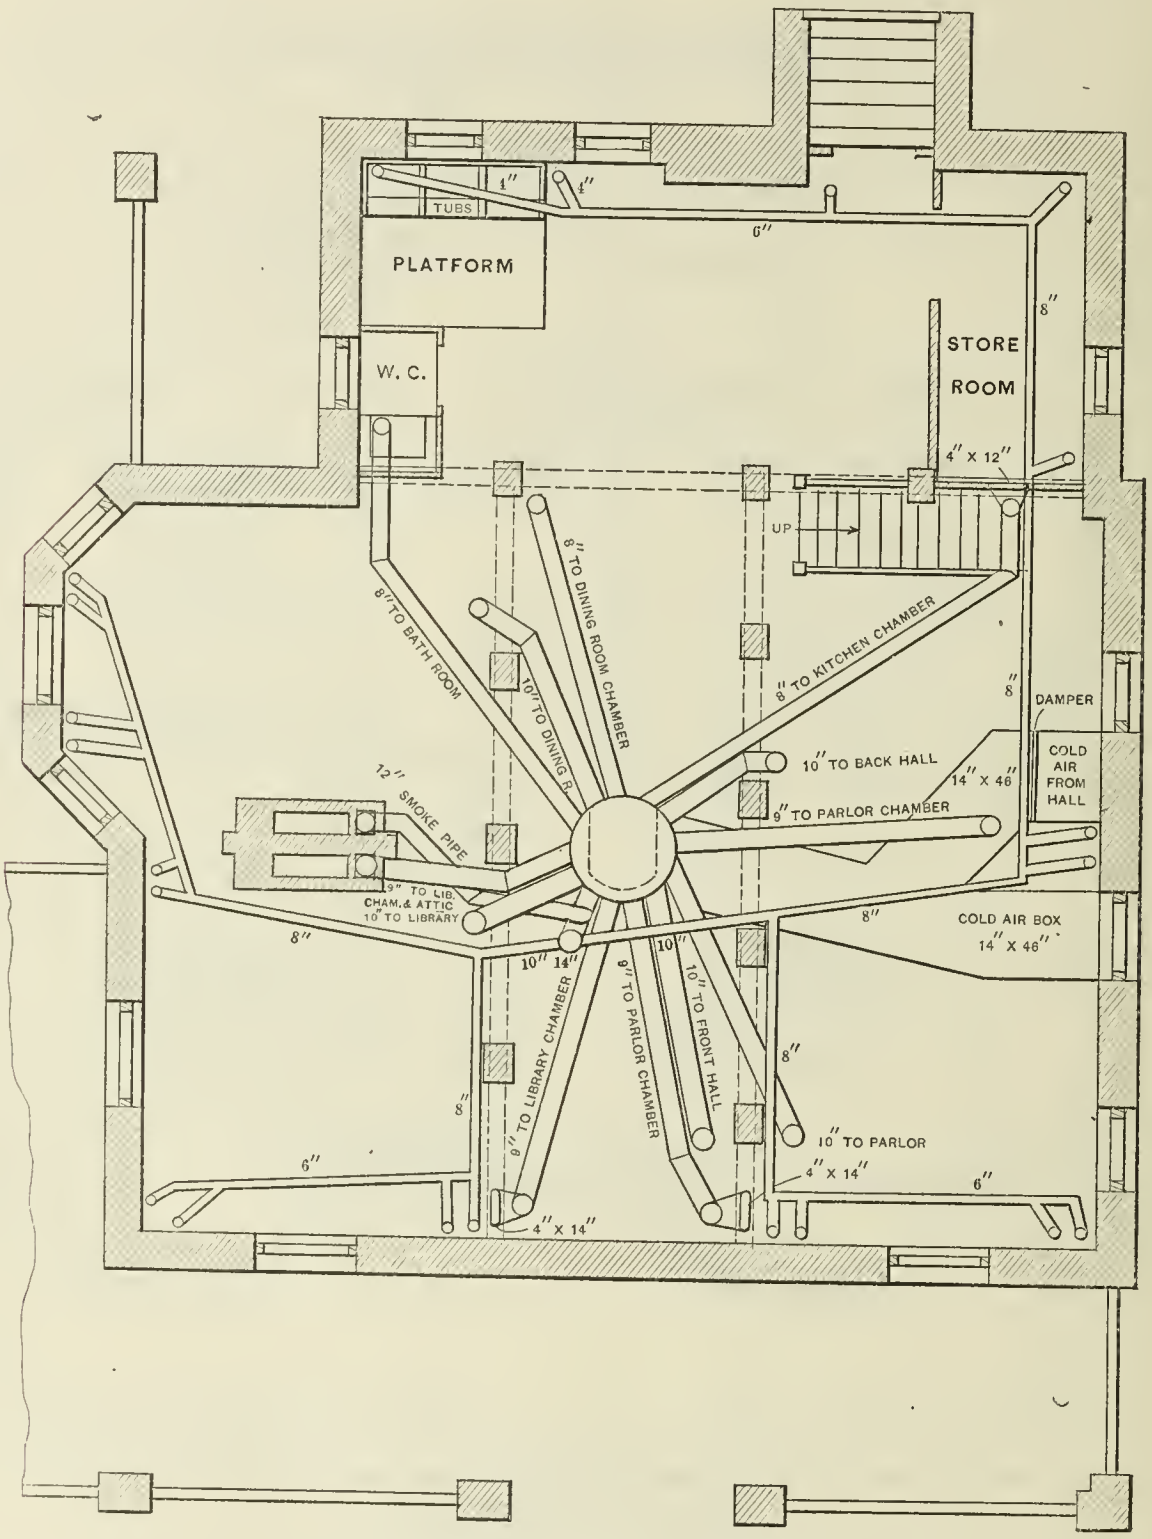

Fig 3.—Basement Plan, Showing Piping System.

The sizes of the various hot air pipes are marked on the basement plan. The basement plan also shows where the 4-inch exhaust pipes from the various rooms come down on the outer walls and connect with the larger pipe which skirts the basement wall to receive them. Commencing at the back of the house a 6-inch pipe receives two vent connections and passing to the north side receives two more, when it is increased to an 8-inch pipe and runs toward the front of the house, where it receives two more, and then runs toward the furnace. The exhaust from the parlor and the parlor chamber are connected into an 8-inch pipe, which runs over to and connects with the same 10-inch pipe which receives the pipe from the back and north side of the building. The vents from the din-

The floor plans give the dimensions of the different rooms, the space heated and the area of the hot air pipe used for heating the room. The ratio of 1 square inch in the hot air pipe to these different quantities is also given. In the rooms that are ventilated the vent pipe area is given and the ratios of 1 square inch in the ventilating pipes to the space in the room. This will enable the student of heating to get a more correct idea of the relation which various parts of the system bear to each other. In calculating the equivalent glass surface, it is assumed that an expanse of 10 square feet of wall surface has the same cooling effect as 1 square foot of glass surface. The custom of making hot air pipes of standard sizes and not varying them according to a room to provide an area in

proportion to the size of the room prevents the relation between the hot air pipe and the equivalent glass surface being the same in all cases. It will be noticed that a given amount of equivalent glass surface is designed to be heated by a given amount of hot air in the first floor rooms, and that an increase of surface is carried by the same amount of hot air pipe area when the rooms are on the second floor. Those who are looking for a rule for determining the sizes of hot air pipes required for rooms will find it much safer to reduce the wall surface of the room to equivalent glass surface than to follow some of the rules of cubic feet of space that have formerly been used.

Under ordinary conditions, in a majority of cases, 1 to 1½ square inches of area in hot air pipe will take care of 1 square foot of equivalent glass surface in the room to be heated when the room is on the first floor. When the room to be heated is on the second floor 1 square inch of hot air pipe area should be provided to heat rooms for each 1 to 1½ square feet of equivalent glass surface. Owing to the fact that two registers are placed in both

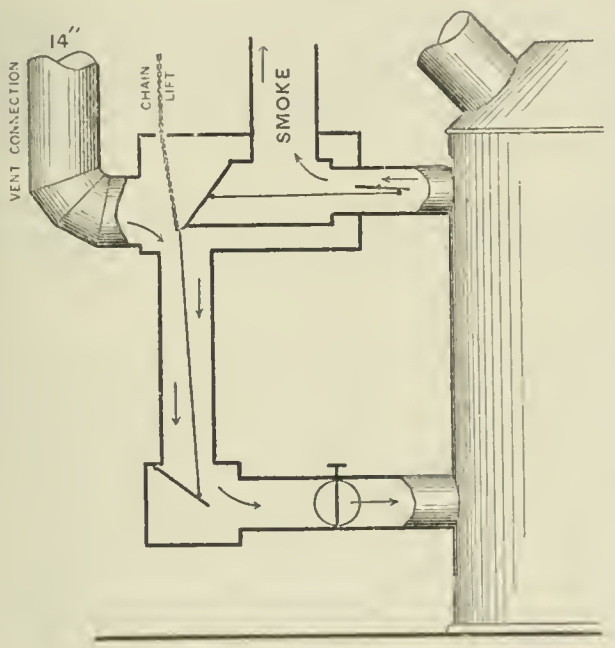

Fig. 4.—The Exhaust Ventilation Connection.

the library chamber and parlor chamber a large amount of hot air pipe area is provided in connection with these two rooms, and the proportions of this part of the heating system seem to be larger than necessary when compared with the rooms immediately beneath them, but as the system has been in satisfactory operation it may be assumed that the provision is made owing to the fact that these rooms will be frequently used as sitting rooms. From the plans it will be seen that the vent area is about one-half of the hot air pipe area, but when it is taken into consideration that the hot air enters at one temperature and shrinks considerably in bulk before finding an outlet through the vent pipes it will be readily seen that the carrying capacity of the two pipes is more nearly even than the areas would represent.

The furnace used has a grate 26 inches in diameter and a grate area of about 530 square inches, or 3⅔ square feet. In the space immediately heated the total wall surface is about 2377 feet, although the cooling effect of a larger space of wall surface has an influence on the heating capacity of the furnace. The equivalent glass surface is 763 square feet, and it may be said here that this does not give the full amount of cooling influence with which the furnace must contend. The cubic feet of space immediately heated is 28,043 feet. The proportion which the hot air pipe bears to the total contents is 1 square inch to 44 cubic feet and 1 square inch to 37 square feet of wall surface and 1 square inch to 1 2-10 square feet of equivalent glass surface. The proportion of grate surface is 1 square inch to 53 cubic feet of space and 1 square inch to 4 4-10 square feet of wall surface and 1 square inch to 1 4-10 square feet of equivalent glass surface.

Those who have made a specialty of heating with hot air furnaces lay out their work with much less labor than is required to supply the information given about this heating system, and in the main are successful in their work. They will be interested, however, in looking over the plans presented and the data given in connection with them, and will doubtless be glad to learn that there does exist a very close relation between the cooling surface in the building and the heating systems which they design and install that can be presented in figures that would not vary greatly if compared.

Monarch Stove Company's Eastern Branch.

Emmett C. Baxter, general manager of the Monarch Stove Company, Mansfield, Ohio, has been spending the present week in New York as the guest of A. L. Canfield, 284 Pearl street. While here Mr. Baxter completed arrangements to open an Eastern branch house at 284-286 Pearl street, New York. A. L. Canfield will be the manager of this Eastern branch of the Monarch Stove Company and look after the interests of the Monarch line of gasoline, gas and oil goods in New York State, Eastern New Jersey, Connecticut, Vermont, New Hampshire and Maine. A suitable warehouse has been arranged for, where a large stock of gas, gasoline and oil goods will be kept to supply the wants of the trade in above locality. The Monarch people will add a number of new and strong features to their line this season, which they will shortly present to the trade.

ODD PLATES.

At a recent meeting of the Board of Directors of the Warren Hardware Company it was decided to enlarge the capacity of the Warren Steel Range Works, Warren, Ohio, the product of which is handled by that concern. The principal building will be raised and a basement constructed which will give an additional floor space of 5200 square feet. This improvement will also necessitate a larger working force. We understand that the company's business has grown to such an extent that the enlargement of the works can no longer be deferred.

The Henry N. Clarke Company, Boston, Mass., dealers in Stoves, Ranges, Heaters and Stove Repairs, long established at 105 Blackstone street, have leased property on Union street, where they expect to be located shortly after January 1.

The demand for a Range suitable for small families which would operate satisfactorily and economically, and at the same time not throw off too much heat, has prompted the Leaf Stove Company of Lansdale, Pa., to bring out an attractive five and six hole construction which they are offering under the name Elm Leaf, and which is illustrated and described in a little circular just issued. The Range is neat in its ornamentation, and is made in three sizes and eight styles, having 6, 7 and 8 inch covers, the arrangement of which is shown by outline drawings.

The Girard Stove & Foundry Company, Youngstown, Ohio, are directing attention of the trade to the different sizes of their Adelbert Prize Wood Cook Stoves. Their announcement states that they have a large stock of these Stoves on hand which they are desirous of closing out before January 1, 1898, and to accomplish this they are naming very low prices on these goods. Full information will be furnished by the firm on request.

Prodigal of heat, parsimonious of coal—is a phrase applied to the Paragon Furnace by Isaac A. Sheppard & Co., Philadelphia. It refers to the equalized draft which they say not only makes the coal burn evenly, but gets out of it the greatest amount of heat possible.

The Cleveland Stove Works of Cleveland, Tenn., have just brought out a new high grade four-hole cook, which they are offering under the name The Chief. It is of attractive exterior, has grate and ash pit so arranged that a clean, clear draft is said to be always assured, has heavy ring covers, supported center, tin lined oven doors, patent oven door opener, a heavy grate and a large, high oven. It is made in three sizes with ovens 18 x 18 and 20 x 20 inches. The manufacturers refer to The Chief as a very durable Stove as well as a rapid baker, having large flues and good draft.

The Bridgeport Stove Company of Louisville, Ky., have been incorporated, with a capital of $75,000, by C. W. Adams and others.

The Bellaire Stove Company, Bellaire, Ohio, manufacturers of Star Ranges, cooking and heating Stoves, expect to double their capacity in 1898, and will have some of the latest novelties in the Stove line. This concern regard the

prospects for next year as very bright and confidently expect to do a very large trade.

The Indianapolis Stove Company, Indianapolis, Ind., are running their works full capacity, and are said to be employing more men than at any time in their history. The new foundry building is 318 x 72 feet, and is equipped with every modern appliance necessary to the successful operation of an extensive Stove manufactory. It is intimated that in the future a portion of the buildings formerly occupied by the Indianapolis Cabinet Works will be used for warehouse purposes.

The T. A. Snow Company of Chattanooga, Tenn., have distributed a folder of somewhat liberal proportions illustrating the Southern Queen Sheet Steel Range, which is offered in a number of styles. This Stove has four and six boiler holes in the top surface, is provided with the modern improvements and is adapted for burning wood or coal as a fuel. Reference is also made to the Southern Queen Sheet Steel Laundry Stove, as well as to the company's No. 308 Range of a size adapted for use in restaurants and hotels. A list of vessels going with each Range when ordered is presented, also some suggestions to be followed when ordering Ranges.

Hugh R. Chambers, representing the Phillips & Clark Stove Company of Geneva and Troy, N. Y., has recently been making a tour, calling upon the trade in various parts of the State. The week before last he was in Fort Plain, where Stewart, Shults & Bergen handle the Andes Stoves and Ranges.

W. H. Colebrook & Co. of Syracuse, N. Y., call the attention of the trade to the merits of their asbestos furnace cement by means of a large card, which is designated as "Style A, Business Men's Mailing Card." It is in effect an exaggerated postal card, on the back of which is printed some information relative to Crown Asbestos Furnace Cement and the claims which are made for it by the manufacturers.

The Ringen Stove Company, St. Louis, advise us that their Steel Range department is running full, and that orders are coming in for Quick Meal Steel Ranges in a very satisfactory manner. Their sales for the season of 1897 to December 1 are just double what they were for the corresponding period of last year.

The Howard Stove Company of Beaver Falls, Pa., favor us with a very neat catalogue bound in red paper covers of their leading specialties. The important addition to their already extensive line is the Domestic six-hole Range, made in a variety of styles and sizes, and embellished with ornamental features which cannot fail to catch the eye of both dealer and consumer. Its constructive features are modern in every particular, and the manufacturers state that the Range is the best seller they have ever offered to the trade. It is intended for hard or soft coal or wood, and is made both right and left hand. It has an oven 20 x 20 x 13 inches, and the size of top measures 29 x 46 inches, these dimensions including the back shelf. Other goods shown in the catalogue include the Cook's Pride, a four-hole left hand Range; the America, a six-hole Range, made either right or left hand; the New Howard; the Hero, a four-hole cook; the New Nora, the New Woman's Rights, for wood only, and the Banner. Various styles of Heaters are also shown, including the Howard Franklin, the Howard Oak, the Ohio Cannon and the Cantaloupe Box.

Among the Special Advertisements this week is one from Schmidt & Co., 114 Nassau street, New York, relating to a down draft, fuel saving, smokeless Stove, especially adapted for burning all sorts of soft coal, about which they wish to correspond with Stove manufacturers.

John Depinet and John G. Liebel, proprietors of the Chicago & Erie Stove Works of West Twelfth street, Erie, Pa., announce under date of December 12 that they have purchased all the business of the Chicago & Erie Stove Works, and will soon start the plant for the purpose of manufacturing the well-known line of Invincible and Helper Stoves and Ranges. Mr. Liebel was for many years connected with the South Erie Iron Works and is thoroughly familiar, by reason of his practical experience, with the manufacture of Stoves.

The Evansville Stove Works of Evansville, Ind., are offering their Model Queen Four-Hole Cook Stove for coal or wood in two sizes, the ovens measuring 18 x 22 x 12½ inches. It is embellished with cast ornamentation of attractive design, augmented with nickel plating on the oven doors, nickeled oven shelf, name plate and oven door opener. A circular which the company have issued also shows the Model Pearl Four-Hole Wood Cook, which is offered in three sizes.

The American Tubing & Webbing Company of Providence, R. I., have recently erected a brick factory 250 feet in length by 57 feet in width, equipped with special facilities to make Gas Stove Tubing. They state that since occupying their new building they have increased their facilities some 50 per cent. and look forward to a prosperous year. Their Flexible Tubing with ½-inch Caldwell's patent ends has proven very popular and is highly spoken of by the large manufacturers of gas stoves. The price-list which the company have recently issued shows the various styles of Tubing which they manufacture.

The Peninsular Stove Company, Detroit, Mich., have issued a very attractive little folder calling attention to the merits of the Modern Peninsular, Sovereign Peninsular and Family Peninsular Cook Stoves, which are adapted for burning coal or wood. In connection with the Modern Peninsular, the manufacturers refer to the merits of the steel oven and state that there is a big saving in both time and fuel and that it bakes quickly and economically. In connection with the Sovereign Peninsular, it is stated that it is "constructed on the latest practical and scientific principles for the combustion of soft coal." It is described as an even baker, a rapid cooker and decidedly economical. The Family Peninsular is designated as an up-to-date Cook Stove in which "every advanced idea in construction, style and finish is embodied." The folder carries a *fac-simile* of the Peninsular guarantee bond which accompanies every Peninsular Stove, Range and Furnace.

The Excelsior Stove & Repair Mfg. Company, Quincy, Ill., are sending out a circular letter informing the trade that they are now in a position to fill all orders promptly on their line of Sheet Iron Air Tight Wood Heating Stoves and Up and Down Draft Radiators. The company inform us that they have operated their plant day and night since August 1, and report a largely increased business.

The Cook & Van Evera Company, 173 Lake street, Chicago, are advising the trade by means of facetious cards that they are in line for the season of 1898 with Jersey Cooks and Ranges and the Wickless Blue Flame Oil Stove.

The March-Brownback Stove Company of Pottstown, Pa., are distributing with their compliments a very neatly gotten up memorandum book of a size convenient to carry in the vest pocket. It contains a calendar for the years 1898-99, blank lines on two pages to be filled in for purposes of personal identification, a few suggestions as to what to do in case of accidents, some antidotes for poisons, Weather Bureau signals and their explanations, rates of postage, &c., and a number of pages for noting the expiration of insurance policies. A majority of the pages are spaced with lines (a week to a page) for purposes of memoranda. The little pamphlet is of the same general style as those which constitute convenient advertising mediums and are widely distributed at the close of each year.

Apostolides & Co., Braila, Roumania, who are large importers of American Machinery, announce their intention next year of adding all kinds of American Hardware Novelties, Bicycles, Typewriters, Sewing Machines, Tools, Lamps, Stoves, &c., to their line, and also opening up a general commission department. For this purpose their superintendent, James E. Erckman, is now on his way to New York City, where he will make his headquarters at 631 Second avenue. They request American manufacturers of the above goods to send catalogues, prices, &c., in duplicate to Mr. Erckman in New York City and to the house in Braila.

Boulard & Co., who are opening a new Hardware store at 274 St. Lawrence street, Montreal, Quebec, would be pleased to receive catalogues and other printed matter from manufacturers of Hardware, House Furnishing Goods, Mechanics' Tools, &c.

The trade are reminded of the products of the Meriden Machine Tool Company, Meriden, Conn., by a number of very clever and entertaining little circulars which they distribute. From the outside of the pamphlets there is no telling what is within, and the reader's curiosity is worked up through some little distance before he is satisfied by being brought up face to face with the extensive assortment of forming lathes made by this concern. Any one who is curious to examine these publications will do well to write to the Meriden Machine Tool Company for samples.

We are officially advised that the articles recently published in the Pittsburgh daily papers concerning location and building of a large Steel plant by the W. Dewees Wood Company are erroneous, misleading, damaging, and altogether without foundation.

The Massillon Bridge Company, Massillon, Ohio, have closed a contract for building a steel cantilever bridge, 800 feet long, over the Magdalena River, at Honda, South America.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Only business of strictly commonplace character has taken place the past week, and wholesale prices have fluctuated to no greater extent than 5c. per 100 lbs. No life has been infused into the once speculative branch of the market, and it seems doubtful that consumers or jobbers purchased more extensively than almost certain near future and immediate wants necessitated. The arrivals since December 1 have exceeded 1100 tons, but this large supply has caused no pressure to sell, and it is therefore presumed that consumption is remarkably good for this season of the year, despite the calm state of the market. Jobbers continue to quote 14¾c. per lb. for small lots of Straits Pig from store.

Copper.—The improvement in values and the better tone to the market that were noted last week have made no further progress, but no reaction has taken place, although reports of other than ordinary transactions were strictly the exception. More than passing attention is given to the fact that the exports thus far this month have exceeded 5000 tons, and to the probability that, with necessary ocean freight room, the total for the entire month will reach 10,000 tons, in the face of somewhat long continued reports of trade being slow. Consumption is good for the season of the year and retailers' prices are firm, small lots of Lake Ingot from store ruling at 12¼c. and of Ansonia Grade Casting Copper at 11¼c. per lb.

Sheet Copper.—The condition of this material has in no wise varied during the past week from that mentioned in our last report. The demand is tame and confined to small lots for immediate delivery. Competition among dealers is rather keen, and prices, in a retail way, are hardly as strong for Sheet Copper as for the raw material. It is nominally quoted at 15c. per lb., basis.

Pig Lead.—Dealings have been on a moderate scale, consumers restricting their purchases to the limit of their immediate needs, while the big buyers seem to be out of the market. There is a fairly large volume of inquiry, however, and the market at the close showed somewhat better tone. Jobbers quote American Pig in small parcels from store at 4⅛c. to 4¼c. per lb.

St. Louis advices report that the market for Pig Lead in that quarter shows considerable firmness. Offerings are fewer and producers are not disposed to accept future business except at advanced prices.

Spelter.—Offerings have continued free and the market remains in a somewhat unsettled condition, under the weight of present and prospective over supply. There has been merely a moderate business, the demand being very slack at present. Jobbers' prices are rather easier, good Western brands in small lots from store ruling at 4 45c. to 4½c. per lb.

St. Louis advices indicate no change in this metal in that quarter. Offerings are free, but buyers are few and cannot be induced to anticipate their wants.

Sheet Zinc.—A moderate demand exists of very ordinary type. Prices are unchanged. Jobbers quote 600-lb. cask lots at 5⅝c. to 5¾c. per lb, and smaller quantities at 6⅛c. to 6¼c.

Antimony.—An ordinary movement in a jobbing way is about all that has taken place. Prices for retail parcels are steady at about 7¼c. to 7½c. per lb. for Japanese, 7¾c. for Hallett's and 8½c. for Cookson's.

Nickel.—Prices remain steady at about 37c. to 38c. per lb. for small quantities.

Aluminum.—The demand for this metal keeps up in good volume. Present prices are as follows: No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb.; 100-lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb.; 100-lb. lots, 33c, and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb.; 100-lb. lots, 30c.

Tin Plate.—There has been some improvement in the tone of the market as compared with a week ago. Early in the current week business of very fair volume was effected in American Cokes, chiefly for delivery during the first three or four months of the coming year. Toward the end of the week, however, the market relapsed into comparative dullness. Prices closed quite steady, ruling 5c. to 10c. a box above the extreme lowest prices at which some business was effected some time ago, and there was no special pressure to sell for either spot or future delivery. The recent demand, which was only moderate, all told, was chiefly for 90 and 95 lb. Cokes. Charcoal Plates and Roofing Ternes were almost neglected. The outlook for business in the new year is regarded as doubtful. While many of the mills are well supplied with orders to last them some months ahead and available stocks of Tin Plate are quite light, yet prices do not maintain the strength which these features would suggest. An impression seems to be abroad among buyers that prices are likely to go much lower. Therefore they are holding off buying ahead in order to take advantage of the expected reduction. The premises for this belief are not very convincing, however, and most of those best able to judge do not at all share in the expectation of falling prices in the near future. On the contrary, they look for greater strength in the market for Tin Plate so soon as the large consumers begin placing their orders more freely. They think that for the present at least, or until the new mills now going up get into producing shape—which will not be till late in the year—the production will by no means exceed the consumption, but is more likely to fall behind it if the spring demand for Tin Plate assumes normal proportions. The retail business, as is usual at the close of the year, has shown a marked falling off during the week, only small lots for immediate use being called for. Jobbers' quotations are unchanged, moderate sized lots of American Plates for spot delivery at New York, Philadelphia or Baltimore being about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3 60; do., 100 lbs., $3 40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway Grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are moving in a very moderate way, outside of what is being done direct by packers of export goods. Prices are largely nominal.

Sheet Iron.—While the mills are still busy on orders placed some time back, the current demand for both Black and Galvanized Sheets has fallen off considerably and mill prices are hardly as firm as of late. Western mills are in some cases quoting for delivery in the East prices which underbid those generally maintained by the Eastern makers and some considerable cutting is also being done by the jobbers. Small lots from stock sell in this section at about 2.35c. to 2.40c. for No. 27 Common Black Sheets and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: This month will be one of the best Decembers in the Sheet trade for many years. The mills are full of work and more business keeps coming up. Prices are a little easier, probably on account of cut freight rates. Small lots from stock are quoted at 2.20c. to 2.25c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—Business is still very slow, both in home and export orders, and prices, while showing no quotable change, are inclined to weakness. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10 50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5 25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

The December blotter distributed by the Joseph Dixon Crucible Company, Jersey City, N. J., shows St. Nicholas well laden with Dixon Pencils and about to descend a chimney. The statement is made that if the receiver does not find any Dixon Pencils in his stocking Christmas morning he should send 16 cents in stamps for samples.

CHICAGO REPORT.

Scrap.—The movement is light at present. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3 75	....

All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

Notwithstanding the proximity of the close of the year, and the fact that trade is feeling the quieting influences of the near approach of the holidays, business in general continues in at least fair volume. Jobbers generally, especially in the West, report a good demand, not only in seasonable specialties and holiday goods, but also for general Shelf and Heavy Hardware, indicating a good condition of things among the retail trade, who are apparently doing a better business than for several years. The large crops and the great amounts realized from them are thus evidently affecting the general situation and producing a more prosperous state of things than has existed for some time. The larger trade are purchasing conservatively and without much of a speculative spirit, but more confidently than for some years, and are anticipating a good business during the coming season. In the lines which may be affected by the consolidation of Wire interests now under consideration the market shows a firm tone, and such goods as Nails and Wire, which will be the first to respond in case the negotiations are successfully consummated, are held at slightly higher prices than prevailed a short time ago. In these lines, however, the manufacturers are refusing to accept orders for future delivery. In many lines the market shows but little change in the matter of prices. Shovels remain as before, the manufacturers not deeming it advisable to make the advance advocated by some. A revised list of Padlocks establishes slightly higher prices for these goods. Some lines are a shade weaker in price, owing to efforts on the part of manufacturers to induce orders by granting concessions to purchasers. On the whole the market is in a healthful condition and is characterized by a gratifying steadiness.

Advices from Chicago.—Shelf Hardware jobbers report a very active trade. The local jobbing interests now being centered in but two houses, it is natural to assume that they are profiting very much by the absorption of the business formerly done by those who have dropped out of the trade. The remaining jobbers, however, say that they observe that their regular trade is much heavier, and therefore attribute their large business to the improving general conditions. The demand, instead of calling mainly for seasonable goods, covers all classes of Hardware, including Builders' Hardware, Mechanics' Tools and Cutlery. The orders for Wire Products have been stimulated to some extent by the reported successful movement in the efforts to effect a consolidation of the manufacturers, and the improvement so far has not become sufficiently heavy to have a marked effect on the volume of trade. An excellent trade for December is reported in Tinware and House Furnishing Goods. The demand for seasonable goods in these lines has been strong, particularly for Elbows, on which dealers had not stocked up, and which are now badly needed. The Heavy Hardware trade shows no signs of falling off. The volume of business so far has been up to that for November, and it will be remarkable if December, as now expected, shows a heavier business than that month.

Advices from St. Louis.—The Hardware jobbing trade is gradually easing off, as is usually the case at this time of the year. Holiday goods are being ordered in large quantities and this department will show a heavy increase in comparison with former years. The general tone of the market shows underlying strength, and with a brisk trade after the turn of the year some advances in prices will doubtless take place. The numerous combinations talked of keep jobbers on the anxious bench, so that they find it difficult to determine whether it is time to place their orders or to await developments and order later. Collections are satisfactory.

NOTES ON PRICES.

Wire Nails.—During the past week the Wire Nail market has been characterized by a decidedly firmer tone, with a disposition on the part of manufacturers to refuse orders for execution after January 1. The trade evidently are endeavoring to cover their requirements in view of the possibility of higher prices, as a result of the successful accomplishment of the plans for the control of the Wire business. It has been difficult for the trade in many cases to place their orders on account of the depletion of manufacturers' stocks and the fact that the output for the remainder of the month has been covered. The price during the week has been held steadily at $1.40 for carload lots at mill. Small lots from store command the usual advance.

Advices from Chicago.—Manufacturers report heavy inquiries. Most of them are for deliveries extending into the future, on which they are absolutely refusing to quote. Orders are now being taken for immediate shipment only. The quantity of Nails available appears to be limited. Jobbers have advanced small lots from stock to $1.55, and this price may be pushed upward at any day.

Advices from St. Louis.—The market maintains the improved condition noted in our last report. The demand is extraordinarily large for this season of the year, and while the general impression is abroad that the proposed consolidation of the Wire interests does not necessarily mean higher prices for Wire Nails, retail dealers remember the last combination, and are not willing they shall be caught with light stocks and with an advancing market to face. Jobbers report a steady trade at $1.65 to $1.70, base, for small lots from store.

Cut Nails.—The Cut Nail market has been uneventful, there being only a moderate demand and a lack of strength in prices. Cut Nails have not as yet been affected by the firmer tone in Wire Nails. Small lots from store are held at $1.30 to $1.35.

Advices from Chicago.—Business in this line continues quite moderate, with small lots from stock unchanged at $1.45.

Advices from St. Louis.—There is no change to note in Cut Nails. The demand is only fair and prices are unchanged. Jobbers ask $1.45 to $1.50 for small lots from store.

Barb Wire.—The effect of the negotiations between the manufacturers of Wire Rods and Wire products generally is seen in the increased orders for Barb Wire which have been coming in to the manufacturers. The trade are evidently disposed to purchase somewhat conservatively, and yet to cover their requirements for next season at least partially, in view of the possibility of higher prices as the result of the success of the negotiations in progress.

Advices from Chicago.—Manufacturers are restricting sales of Barb Wire to orders for immediate shipment, except for the higher grades of Wire, on which the usual practices of the trade still obtain with regard to spring delivery. Ordinary Barb Wire is sold in restricted quantities, and prices are very firm at $1.60 for Painted and $1.90 for Galvanized in small lots from stock.

Advices from St. Louis.—The demand for Barb Wire

is only moderately heavy, yet mills are asking full prices and are not looking for business at cut rates. Jobbers quote Painted at $1.65 to $1.70, with the usual advance for Galvanized.

Smooth Wire.—The market for Smooth Wire is steady and has a confident tone.

Glass.—The factional strife between the cutters and flatteners on the one side and the blowers and gatherers on the other has been settled. This brings the settlement of the wage question between the manufacturers and workmen nearer, inasmuch as no agreement could be reached while the workmen disagreed among themselves. Trade features which have existed for some time continue. Manufacturers who hold Glass are demanding high prices. New York and Chicago jobbers are asking 60 per cent. discount. Imported Glass is quoted at 80 and 10 per cent.

White Lead.—The condition of the market and the general surroundings are much the same as they were a week ago. Crude materials have undergone only slight variation in price, orders for the pigment have been light, as usual at the end of the year, and no changes in corroders' lists have been made.

Red Lead.—Moderate sales of small lots from store make up nearly the entire business of the week, and little interest has been shown in contracts for future delivery. Prices, however, are held quite steadyall along the line.

Linseed Oil. — The market underwent no change until Tuesday, despite the fact that the cost of Seed has averaged higher. That purchases should be moderate is not a remarkable matter, since buyers usually go slow at the end of the year, but that buying should be as tardy as it is and competition so keen, in the face of the fact that Oil is relatively much lower than the raw material, is rather surprising. Seed is about 45 per cent. dearer than it was a year ago, while Oil is only 15 per cent. higher. Retail prices have been advanced to 42 to 42½ cents for City raw, with boiled 2 cents above those figures.

Spirits Turpentine.—The market has been quiet throughout the week, and prices have ruled steady at about 34 to 34½ cents per gallon for small lots from store.

Old Paper, Rags, &c.—Business keeps up well for the time of the year. The demand for almost all lines of Paper Stock is good and prices remain quite firm. Dealers are paying about the following rates for New York City delivery:

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅞c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1⅛c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ⅝c.
No. 1 Mixed Shavings	per lb.	⅝ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 9/16c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅜ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	⅜ to ¾c.
Hemp Twine	per lb.	1⅝ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—A fair demand is noted and prices show no quotable change. Local dealers are paying about the following figures:

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

A bill presented to Congress by Secretary Long of the Navy Department provides for one sea going coast line battle ship for service on the Pacific Coast and six sea going torpedo boats and three torpedo boat destroyers. The battle ship is designed to carry the heaviest armor and ordnance, and to have a displacement of not less than 11,500 tons, with the highest practical speed. Her cost, exclusive of armament, is placed at $3,750,000. The torpedo boats are to be of about 175 tons displacement, to cost, including armament, not exceeding $1,125 000. The torpedo boat destroyers are to be of about 300 tons displacement, to have a speed of 30 knots, and to cost, including armament, not more than $900,000. The battle ship and not more than two of the torpedo boats and one of the destroyers are to be built on the Pacific Coast, and the remainder on the Atlantic Coast, the Navy Department being forbidden from placing contracts for more than two torpedo boats with any one firm.

The first Patton motor car ever built for street railroad purposes was successfully tested at Cedar Falls, Iowa, last week. In the Patton system the motive power is generated by gasoline, used to operate the dynamo which works the motors, the excess of power passing into a storage battery. This battery is intended to supplement the dynamo on heavy grades, or in starting with heavy loads, or, if necessary, may be used as the sole motive force for a distance of from 8 to 10 miles. The test, although performed under unfavorable conditions, is said to have been in every way satisfactory. The car was run a distance of 3½ miles in 21 minutes, the return trip being made in 17 minutes at a speed of 18 miles an hour.

Special Notices.

Stove and Steel Range Manufactory
Located at MUNCIE, IND.,

To be Sold at Public Sale.

The stockholders of the JOSEPH BELL STOVE & RANGE COMPANY have passed an order to sell their plant and equipment and stocks of material and manufactured stock at public sale, on Wednesday, the 5th of January, 1898, on the grounds of the company at MUNCIE, IND.

The property consists of over 6 acres of ground conveniently situated at MUNCIE, IND., on the West Bank of White River, on the line of the Lake Erie & Western Railroad and accessible to the Big Four Road. The buildings thereon are nearly new and of substantial construction. The Molding building, of brick, is 135 by 145 feet. There are two cupolas. The Mounting and Storage building, also of brick, is two stories high, 260 by 60 feet. Office building and show room of frame, two stories. All of the best construction and conveniently arranged.

There is a complete Nickel Plating plant. There are tools and appliances for the economical turning out of the best class of work.

There is a large line of patterns which includes cooking and heating stoves and a line of popular Steel Ranges.

A gas well on the premises belonging to the company furnishes an abundant supply of natural gas. These works have been in operation until recently and are in order to resume work at any time.

The entire property, including all stock on hand at day of sale, materials, patterns, tools and equipment and good will, will be sold in one lot. Sale to take place on the grounds of the company, at MUNCIE, IND., on Wednesday, the 5th January, 1898.

The terms will be made accommodating. Persons desiring information will please address the undersigned.

JOSEPH BELL STOVE & RANGE CO.,
Muncie, Ind.

BERGER BROS., - - Philadelphia.

Office and Stores: 231 and 237 Arch Street.
Factory near Germantown Junction.

WE wish to call attention to the line of goods for which we are able at all times to quote most advantageous prices.

Our specialty is the manufacture of HIGH QUALITY ROOFING PLATES, and our Brands are known as the standard in their respective grades.

ROOFING TIN PLATE—BRANDS.

"Scott's Extra Coated".	"ABSOLUTELY THE BEST" 47 lbs. coating, and guaranteed to an extent unparalleled in the trade. Net weight, IC, 20 x 28, 240 lbs.
"Triumph Old Method".	Strictly Hand Dipped, Palm Oil process throughout, 38 lbs. coating. Greatly superior to other makers' best qualities. Net weight, IC, 20 x 28, 230 lbs.
"Protection Old Process"	A great favorite; bright clean finish, heavily mottled, 40 lbs. coating. Net weight, IC, 20 x 28, 230 lbs.
"Old Reliable Re-dipped"	Dull oil finish, well mottled, 36 lbs. coating. Very much preferred to the M. F. Brand, which is standard of best quality Welsh plate. Net weight, IC, 20 x 28, 230 lbs.
"Neville Old Style" . .	Very bright, clean and handsomely mottled, 24 lbs. coating, exceptionally rich in pure BLOCK TIN. Net weight, IC, 20 x 28, 220 lbs.
"Duquesne"	The highest standard of rolled roofing plates, has taken the position in America heretofore occupied by the foreign "Worcester" brand. Full weight.
"Pittsburg"	Next quality to Duquesne, and a favorite with many.
"Raymond"	A medium grade, suitable for ordinary work. Always sold at a very moderate price Full weight.
"Allegheny"	The lowest priced roofing plate we have to offer. You will be agreeably surprised at its quality, taking into consideration its low cost.

BRIGHT TIN PLATE—BRANDS.

"Finest" .	The very best Bright Charcoal Tin. Superb coating, perfectly cleaned, closely assorted. "Finest" in name and quality.
"Clifton" .	An excellent plate, well coated. "Melyn" grade.
"Furnace" .	Medium quality, regular and light weights, also special sizes for Heater Pipe.

"FINEST" and "CLIFTON" brands in IC to IXXXX, 14 x 20 and 20 x 28, and also in many odd sizes.

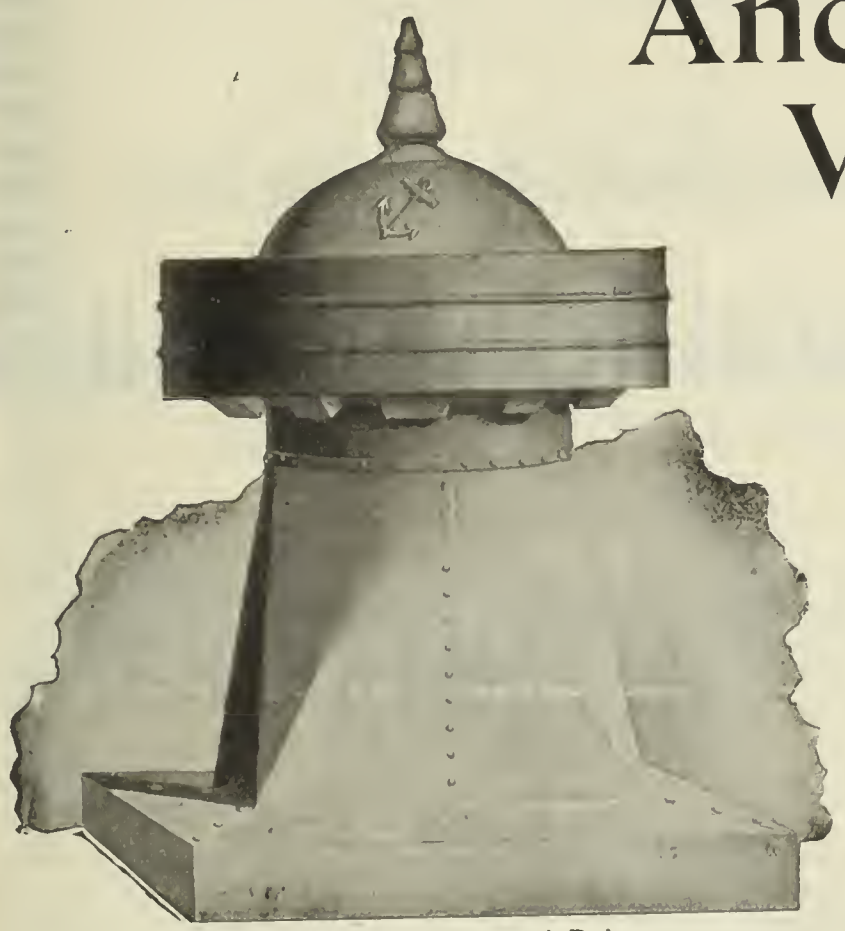
PHILLIPS TIN PLATE CO., Inc.,
PHILADELPHIA.

Are you thinking of your lost trade in tinware—thinking up the cause of it, and a remedy? Cheap iron ware in its variety of enamels you doubtless reason has been largely responsible for your decreased sales. Perhaps so, or perhaps you did not have the right kind of material in your ware. People prefer tinware, if they can get the *lasting kind*, and you can satisfy them just so soon as you make your stock from GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES. Coffee pots, tea kettles, and the like made from these plates last *Years*, and you can safely guarantee them.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

GUMMEY, McFARLAND & CO., Philadelphia.



Send for Catalogue and Prices.

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age*.

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

Tinsmiths' and Roofers' Tools, Shears, Presses, Dies and Special Machinery for Sheet Metal Work.

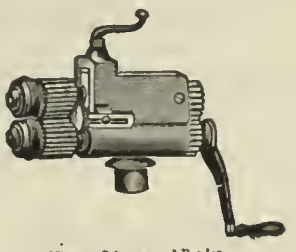
Niagara Brass Mounted Groover.

Niagara Brass Mounted Groover.

The reversible round horn permits of grooving work 2 inches in diameter and larger. The seam can be grooved toward the inside or outside of the work. Capacity No. 24 iron.

The No. 2 Niagara Groover grooves the seam on the way forward, and flattens it on the return trip.

Niagara Stove Pipe Crimper and Beader.

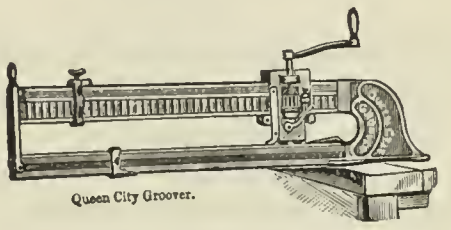


Niagara Crimper and Beader Direct Acting.

It crimps and contracts the edges of stove and conductor pipe, to facilitate putting the lengths together. The rolls are of steel, and the gears machine cut.

The direct acting machine works faster; the geared one is easier to operate.

Queen City Groover.



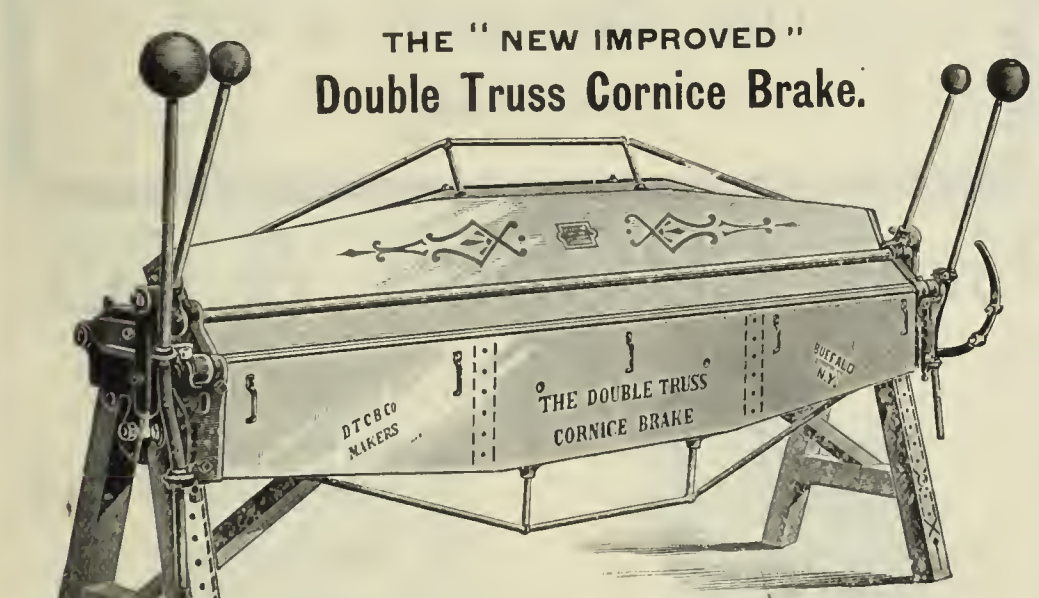
Queen City Groover.

It grooves and closes the seam at the same operation, making it unnecessary to hammer down the seam with a mallet. Will groove pipe No. 24 gauge and lighter, not less than 2⅞ inches diameter, up to 32 inches long. Can be furnished with round horn same as on the Niagara Groover, in place of the square horn.

Four grooved rolls 3/16, 5/16, 7/16 and 9/16 inch are sent along.

THE "NEW IMPROVED"

Double Truss Cornice Brake.



8 and 10 ft.

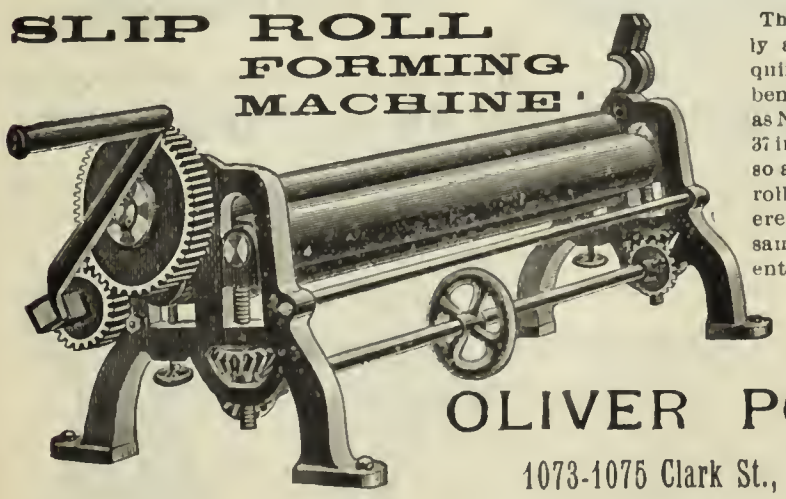
Send for particulars of this "New Improved" Brake. It has been entirely reconstructed on our "New" system and made from new patterns throughout, combining lightness and strength with durability and efficiency. Guaranteed to give entire satisfaction.

SENT ON TRIAL.

Will give an EXTRA discount for a short time to introduce them.

The Double Truss Cornice Brake Co., 259 Grant Street, Buffalo, N. Y.

SLIP ROLL FORMING MACHINE.



This machine is especially adapted for work requiring a slip roll or for bending sheets as heavy as No. 12 iron, in lengths of 37 inches and under, and is so arranged that the back roll can be raised or lowered on both ends at the same time, or independently if required.

BRIDGEPORT, CONN

—About twenty years since the writer knew a young man who fell deeply in love with a red-cheeked lassie who worked in the same mill. But, though she was the subject of his nightly dreams and daily thoughts, he was so bashful he could not, or dared not, show his hand. At last, driven to desperation, he put up the banns of marriage at the village church.

On the following morning the unwooed bride-elect went to the young man and demanded an explanation. Thus cornered, he confessed the truth, adding: "If tha will not ha' me, I con gi' backword."

"Whod did tha pay?" asked the practical girl.

"Four an' sixpence."

"Well, tha corn'd get it back, and it's no use losin' four an' sixpence; but tha knows tha'll ha' to come a coartin' all't same."

And he did.—*Weekly Telegraph.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Hot Water & Steam Boilers & Furnaces.

EVERY SQUARE INCH OF

RADIATING SURFACE

Of this FURNACE is

FIRE SURFACE.

ZANESVILLE, O., Dec. 10, 1897.

THE CARTON FURNACE CO.,
UTICA, N. Y.

DEAR SIRS:—Before purchasing a heater for my residence, I investigated into the merits of the different representative heaters; I travel in all parts of the United States and therefore had ample opportunities for my investigation. From the many favorable reports from the different cities I traveled through, I decided to purchase one of your No. 00242 **Carton "C" Series, smoke-consuming furnaces**; I have never had cause yet to regret my decision. It is remarkable the **exceptionally small amount of fuel** the furnace consumes. My house consists of **nine rooms**, and with this size heater the fire is run on **slow combustion**; it is very **simple** to **manage**; always under **perfect control**; **no dust** or **smoke**, and I consider it a **perfect heater** in every respect. The radiating surface of the heater is almost **entirely direct "fire surface"** and therefore under **slow** combustion, the radiating surface of this heater is **particularly** effective, and **every square inch of the radiating surface is equally effective**; this **particular feature** in the construction of this heater is one in which **it excels all other** constructions.

Yours truly,
HENRY F. ROHRMAN.

MR. JNO. FORBES,
Mgr. TUBULAR HEATING AND VENTILATING CO.
MY DEAR SIR:
In reply to your inquiry about the Forbes Furnace, would say I think it will be all you claimed for it. We have now had it about a month, and although the weather has not reached zero, it has been down to 10 degrees above. We have not had any difficulty in keeping our rooms comfortable, and do not think we shall during the remainder of the winter. It is easily managed and I think economical in the consumption of coal.
Very truly,
I. N. EVANS.

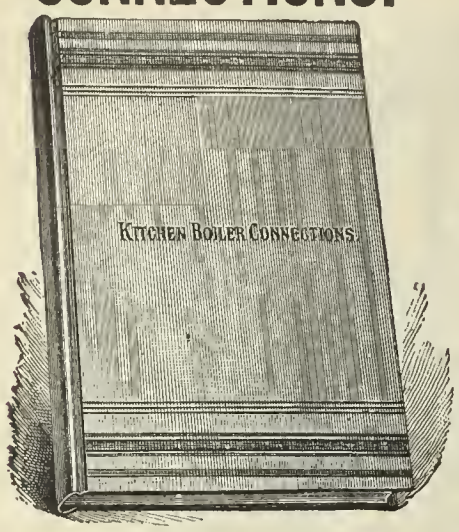
ICHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

"The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

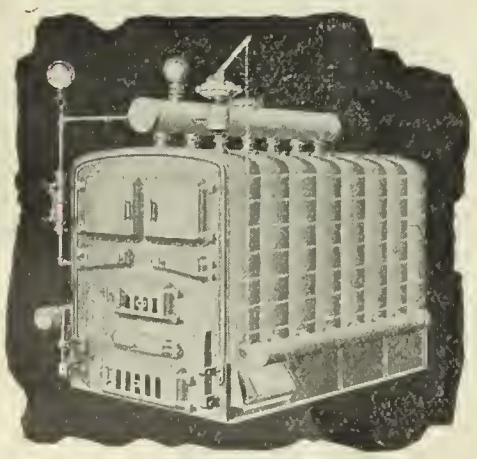
no bricks.

The outer surface of each section of this heater has cast iron ribs, which allow the boiler to be completely covered with asbestos cement—if that is desired. The use of the



"AMERICAN" STEAM HEATER

does away with the usual large amount of cumbersome brick-work required in setting a horizontal tubular, or other type of heater, in which the firebox is formed of brick. That means a saving of room and a saving in cost of apparatus.

—TACK-LING A BEAR.—An Idaho farmer discovered a bear pulling up vines in the garden, and having a gun and powder, but no bullets at hand, decided to use carpet tacks. Approaching as near to the animal as he considered judicious, the farmer discharged his gun, and when the smoke had cleared away, his wife who had been watching the proceedings, saw both man and beast stretched out on the ground, the farmer being about 10 feet from where he was when he fired. His wife ran toward him, believing him dead, but before she reached him he rose up and said:

"If them carpet tacks is as wide spreadin' in their front action as they be powerful in their back action, that bear'll drop into pieces no bigger than fish bait when we pick him up."

On dressing the animal it was found that the tacks had indeed spread considerably, for they were found sticking in his heart like pins in a cushion, while the general distribution of them extended from his snout to his tail.—*Exchange.*

—"How still they are," remarked Mrs. Fogg, apropos of the young couple in the next room.

"Yes," replied Mr. F.; "it reminds me of my army days. It was always wonderfully quiet just previous to an engagement."—Boston *Transcript.*

—"AN allowance is something like a bicycle."

"How so?"

"A man can put his wife on it but he can't make her stay on it."—*Chicago Record.*

"Small Talk About Business."

By A. E. RICE.

A Banker's Business Hints for Men and Women.

A bright man, with his wits about him, is often described as "All Business." Being "all business" is knowing how to do the right thing the right way.

Do you want to be "all business?" The book tells. The wrong way wastes money and wastes time. Where is the good of that? The book tells nearly everything that an enterprising business man ought to know. Everything in it is worth knowing.

The book is called "Small Talk About Business." It is full of money-saving talk for old and young, for men and women, for business-like and unbusiness-like people. YOU ought to have it.

Price, 50 cents. 120 Pages. Elegant Cloth Binding.

For Sale by DAVID WILLIAMS CO., Publishers and Booksellers, 232 William St., New York.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00.

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed. The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft.

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*

"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex.

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

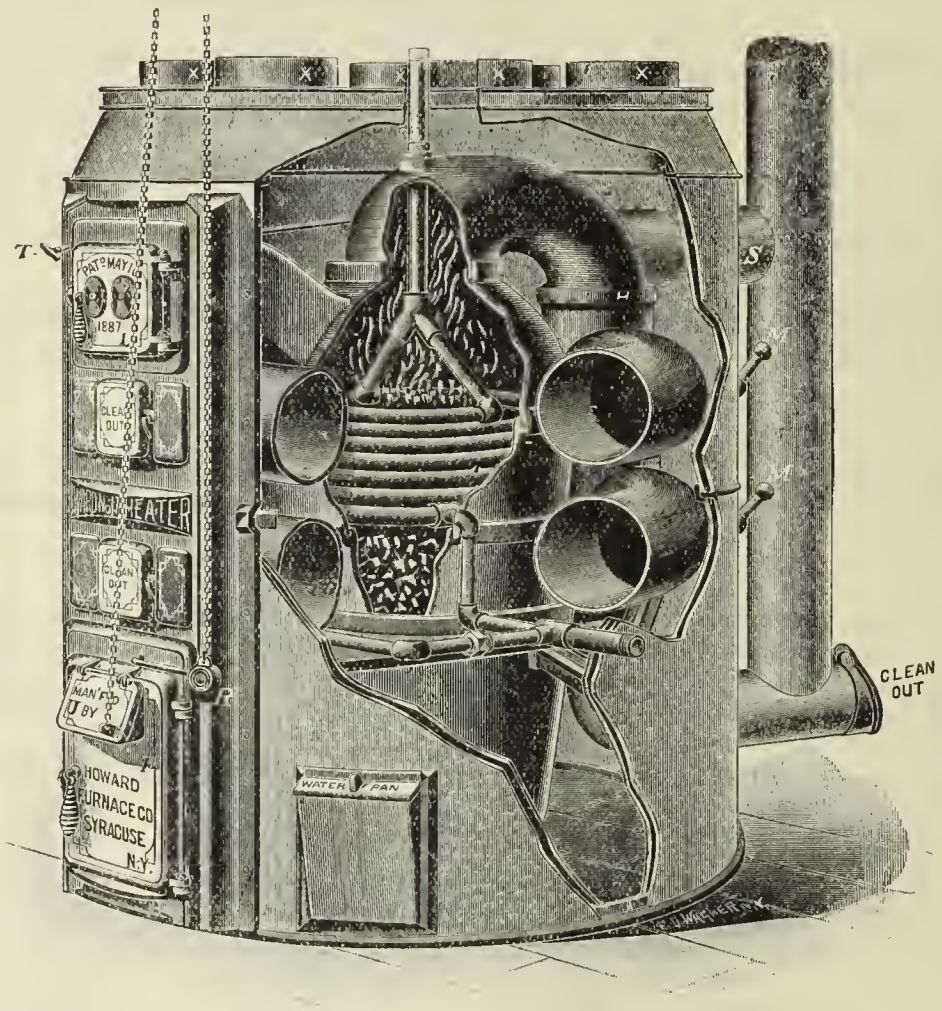
for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

Sent, Express or Postage paid, on receipt of price, FIVE DOLLARS, by

DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., New York.

After All Has Been Said

about the merits of different furnaces and after all that has been done to reach the highest pinnacle of perfection in their construction, there still remains certain well known and ascertained facts, certain principles of a distinctive quality which mark the one from the other as to their actual value and worth. It is this quality, this principle, that is shown which we talk about and prove.



About The Best

furnace we know of is the one shown in the above cut. As every dealer knows, every manufacturer of furnaces makes the same claim. That's business. But granting that every furnace made heats, the economical feature is in many instances lost sight of. The most practical illustration of fuel saving is concentrated in the two hollow radiators which encircle this particular style of furnace.

The Business Situation.

The familiar salutation, "A Merry Christmas and a Happy New Year," should, at the present time, strike a more cheerfully responsive chord in the business world than has been the case in several years past. Circumstances conspire to give to this season a brighter aspect than it has borne since the panic of 1893. The current volume of business is larger than that of 1892, the last year of real activity, and the conditions now ruling are even more favorable than at that period. Capital and labor are both better employed. The ranks of the active workers are fuller and more mills and factories are in operation. Bountiful crops and an immense foreign demand for our agricultural products, together with high prices for wheat, have favored the great farming community and placed them in easy circumstances. Exports of manufactures have broken all previous records, leaving an enormous balance of foreign trade in our favor. Europe is borrowing money from this country at a time when gold is usually being exported to pay our obligations. The weekly records of bank clearings are phenomenal for the season. Railway earnings, that unerring gauge of general trade, are showing remarkable gains from week to week. The foreign relations of the country are undisturbed by any menace. Best of all, the clouds of distrust and lack of confidence which have exerted so depressing an influence over business for years are dissipated, and on all hands hopeful anticipations are expressed in regard to the outlook for business in the coming year. The present, therefore, should be a season of rejoicing to many in whose ears the old Christmas greeting has rung with an uncertain sound in previous years. The past week, as is natural, has shown a sensible falling off in wholesale lines of trade as the holiday season and the annual stock taking period approaches. But the retail trade, particularly in holiday goods, is reported in all quarters to be of a most satisfactory description and far ahead of recent years. The volume of general business last week, as shown by the returns of bank clearings, was 26 per cent. greater than that of last year at the same time and 2.5 per cent. above the figures for 1892, and the present week is likely to make as good a showing. The speculative markets reflect the usual ante-holiday quietness, with no radical changes in prices. Local money rates have stiffened, owing to the large shrinkage in the cash holdings of the city banks, due to a cessation of the eastward flow of currency from the interior and to preparations for January interest disbursements. Otherwise there have been no financial changes worthy of note. The metal markets are throughout dull and featureless.

The Future of Business.

The natural, but on the whole unwise, desire of human nature, says *The Iron Age*, to unveil the future has in the case of the business man the good reason that the wise conduct of his affairs necessarily implies a forecast of what is likely to happen in the near future. To that extent at least an inquiry of this nature is both reasonable and proper.

If it is the unexpected that always happens, it is not because events are not the logical result of cause and effect, but becuse of the immensity and complexity of the problem as presented to human intellects. Not only can we never hope to grasp all the innumerable threads that make up the apparently tangled skein, but we can never be sure, mathematically speaking, which are the constants and which are the variables in the equation. If, like the Weather Bureau, only a moderate percentage of our foreeasts prove correct, we have done well and should be content.

There were not wanting long headed men to foretell the panic of 1893, and it did not require much knowledge of the past to deduce for the future the facts of the loss of business confidence, the craze for cheap money, the popular unrest and discontent and the business paralysis which are the inevitable accompaniments of hard times. Any attempt to in the least tell of the likelihood of coming events must be based upon a study of the past and the consequent law of probability as to history repeating itself. This is rendered apparently hopeless by the evident fact that we stand upon the threshold of a new era, and that in its essential features it promises to be foreign to all previous human experienees.

The most abiding effeet of the panic of 1893 was the sudden and complete severance with our commercial past and the discarding of those inheritances of war times—the happy-go-lucky methods of buying and selling, the unquestioned belief in regularly recurring cycles of boom and speculation, the lack of economy in production and the extravagance in distribution, the prevalence of great margins of profit, and the blind confidence that the future was an inexhaustible fund, against which we could always draw in the way of constant multiplication of machinery and of factories.

Three years of distress and agitation have not only brought us to a realizing sense of changed conditions that are both world wide and permanent, but have also set us on the road to the satisfactory adjustment of ourselves to our new environments.

First of all, it is clearly seen that for us at least the root of the matter lies in the question of distribution. The bugbear of a constantly increasing expense account that will not down can only be solved in part by economies in production. A liberal outgo

must be at once the precursor and cause of a large incoming, and false economies in the various methods of keeping the goods before the public mean only too surely a falling off in demand. Reductions of salaries and wages are only too often at the expense of efficiency, and are becoming daily more impracticable, save in the temporary stress of emergencies. We no longer accept as an economic maxim the "Iron Law of Wages," which proclaims a constantly decreasing earning power on the part of the individual, for the trend of facts is distinctly in the contrary direction. Nor can we shut our eyes to the fact that the great mass of humanity is aware of its growing power and will certainly never voluntarily consent to a reduction in the standard of living. Whether wages increase or values decrease the benefit to the consumer is the same.

The carefully wrought theories which tell of the inevitable reduction of the wage earner to the condition of a mere serf are certainly not in accord with the experience of the last twenty-five years, nor do they find support from any intelligent examination of the changed conditions of the commercial world. If their business is to continue profitable—and upon this fact rests the entire fabric of commerce—where is relief to be found from the unrestrained competition of the day?

Competition certainly has its hard and cruel side, and it is that which gives vitality to the socialism of the times, yet experience forbids us to expect any comfort from those communistic theories which seek to suppress competition altogether, and which are so alluring in theory and so impracticable in operation. At present everything seems to point to the solution by means of intelligent distribution which in the main shall make competition both unnecessary and impossible. All the indications of the times point toward the aggregation and consolidation of great interests, both manufacturing and distributing, to an extent never known before, and in all the various schemes there are no signs of any attempt to advance prices.

The unutterable folly of the opposite plan of making a lot of money in a short space of time seems to be at last thoroughly recognized. Indeed, it can be said of those organizations which have steadily kept the interest of the consumer in view, that they appear to be founded on a rock. Up to date they have successfully resisted alike the attacks of all competitors and the virulence of political assaults. A steady reduction in the price of the articles which they control has been accompanied by an ever increasing profit account.

A discussion of the methods of these combinations, whether for good or bad, does not come within the scope of this article, but the most ardent socialist would find it difficult to present any other practical plan which would be of greater benefit to either producer or consumer. Chimerical as some of these schemes of consolidation may appear to us, they are not confronted with any obstacles more formidable than the short sighted greed of the owners of some plants, and the question of the satisfactory disposition of prominent individuals, for all other questions are principally mere matters of detail. Our export trade will naturally be a large factor in the problem and one whose importance will increase with each succeeding year. It is probable that agriculture will always be the most important interest in our own country, but its relative importance will certainly diminish with the growth of our export trade in manufactured articles. We are gradually losing our fear of the bugaboo of cheap foreign labor, and are slowly realizing that we hold the key of the position, since there are no indications that European manufacturers will ever displace us in the van of progress.

It is easy and natural to indulge in bright visions of our future in this direction, forgetful of the long intervening years of hard and patient labor that are required, yet indications are not wanting that the commercial supremacy of the great English nation is slowly being transferred to her greater offspring on this side of the water. Bold as the assertion may seem, the matter of declining prices is one that need not give us concern, since it is comprehended in that of satisfactory distribution.

There is, however, one bridge we shall soon have to cross, and it must occupy our most earnest thought. It is only a truism to state that we can never enjoy permanent prosperity until our currency is settled upon a firm and enduring basis. So far as the free coinage of silver is concerned, the best thought of the nation inclines to the belief that as an issue it will never again assume the potency and danger that it displayed in 1896. The steady drift of all the world is so unmistakably toward the single gold standard that it would be contrary to all reason and experience for us to fly in the face of progress and take a step backward into the worn out and discarded ways of he past. The decadence of the free coinage agitation is best evidenced by the fact that the principal arguments now used in its favor are those of sentiment and of alleged constitutionality. It has in fact reached the doctrinaire period of its history. The danger consists not in the strength of the free coinage movement as such, but in its being joined with those other issues of unrest and discontent which arise from the period through which we are passing. Our best hope is that an era of prosperity may allay these causes of irritation until we can find time and opportunity to place our currency system upon a stable basis. Meanwhile, the general confidence in the future grows apace and each week witnesses a spreading of the conviction that 1898 holds in store for us better things than we have known for four years. Barring those unexpected changes that it is not in the power of man either to foresee or to prevent, there seems good ground for the reasonable expectation that we are entering upon a period of prosperity that shall recompense us all for our past misfortunes.

The tremendous preponderance of exports in our foreign commerce is a frequent subject of congratulation in trade circles. The month of November showed an excess of merchandise exports over merchandise imports of $64,277,959, and the record for December is likely to run about the same, if not a little more strongly in our favor. The balance of trade on merchandise exports and imports for the calendar year 1897 is expected to come very close to $350,000,000 in favor of this country. This will surpass anything ever before shown in our history. Taking the 27 months ending with December, the aggregate balance of trade in favor of the United States will be over rather than under $800,000,000. These are stupendous figures. Looking at them, it is little wonder that American bankers are loaning money in Europe.

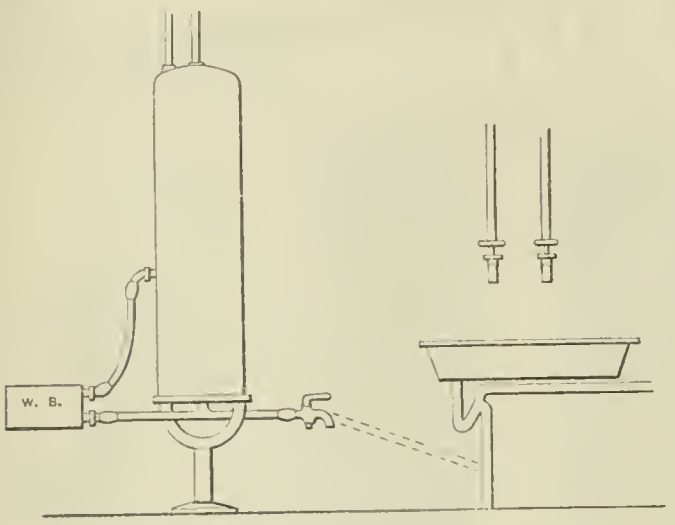
---

* According to mail advices received at San Francisco, Cal., the great fire in Melbourne, Australia, on November 22, was much more destructive than was indicated in the brief cabled report of the occurrence. A large area of the warehouse center of the city was completely demolished, with a total damage of $7,500,000.

THE LETTER BOX.

Is It Dangerous?

From J. T., Hackensack, N. J.—Recently I was called upon to do some plumbing work in a house and found in the kitchen that the boiler was provided with a sediment cock at the bottom, so that in case of any accumulation of mud in the boiler it would be washed out; but the woman in whose house this was found wanted me to put in a different kind of cock, as she expressed it, and run the pipe over to the waste pipe under the kitchen sink and connect with it, as shown by the sketch. I told her I would see about this, and on talking with my employer he refused to do it, on the ground that such a connection would not be sanitary, as under some conditions when the sediment cock was opened the boiler might be emptied and sewer gas fill the boiler and the water pipes in the house. On reporting this she said the boss didn't know



Is It Dangerous?

his business, that the house she had just left for the one she now occupied had just the character of arrangement which she wanted me to make, and if I did not do it she would get some other plumber to do it. Her principal reason for having the connection made was that in the winter season, with the best of care, more or less grease would get into the waste pipe from the sink and have a tendency to choke it up. But when she used a strong solution of lye and poured it into the waste pipe and let it remain there for a time, and then, with a good fire in the range, so that all the water in the boiler was hot, she opened the sediment cock sufficiently to let hot water pass into the waste pipe, it would clean it out nicely, and that, so far as any danger of it being unsanitary was concerned, she could speak from experience that such a conclusion was all nonsense. I have reported this to my employer, but he still sticks to his old conviction and I would liko to know which is right. I hope that plumbers who have had experienco in this line will speak either for or against this form of connection.

Rule for Furance Pipes.

From C. W., Newark, N. J.—I have been a close reader of all that *The Metal Worker* has provided for the asistance of those who make a specialty of hot air furnace work, and submit for the consideration of its readers the following on deciding the size of hot air pipe to be used for a given room. The rule which must be applied, with variations to suit the location of the room and its size, is to multiply the square feet of floor space by 2½, 3, 3½ or 4, then divido the result by 10, and the result will be the area in square inches of the hot air that should be used. For example, a first floor room 15 x 15 feet, with two walls exposed and the usual windows, would have an area of 225 square feet. This multiplied by 3½ would give 787, and divided by 10 would give a fraction over 78 as the number of square inches of area that a hot air pipe should have for this room. If the room had three sides exposed on the cold side of a building the square feet should be multiplied by four. For example, a 14 x 16 foot room would have 224 square feet, and multiplied by 4 and divided by 10 would give 89.6 as the area in square inches of the proper pipe, which would be almost equal to an 11-inch pipe. If the room was to be used only as a sleeping apartment, and over a room that was warmed, either 2½ or 3 should be used as the multiplier, according to the exposure and amount of heat required. It will be seen that this rule is somewhat elastic and not derived from a scientific base, but simple in application and a fair guide. On computing the cubic contents of the rooms with a 10 foot ceiling it will be found that in the more exposed room 1 square inch of area is provided in the hot air pipe for every 25 cubic feet of space, and in the other room the proportion is about 1 to 30. It corresponds with the method of proportioning the pipe to the cubic space, but the different multipliers have an advantage to beginners, as they do not leave so much to judgment. Multiply by 4 for cold exposed first floor rooms and by 3½ ordinarily. For exposed second floor multiply by 3, and by 2½ ordinarily for sleeping rooms. These multipliers used for rooms of different sizes naturally will not always give an amount which corresponds with the area of a regular size of pipe, but will sometimes give an amount between two sizes; then the larger or smaller size may be used as the room may seem to need, or according to the number of pipes which are used on the furnace. If there is a large number of pipes on the furnace, taxing its capacity, better results will be secured by using the smaller size of pipe. Small furnaces and small pipes only do their work at the expense of overheating the air, which should always be avoided.

Air Pressure and Mercury Column.

From J. C. M., Kansas.—I want to know how many inches of mercury it takes to make a pound of air pressure on gas pipe tested with a mercury gauge. The hole in the glass containing the mercury is about 1-16 inch. The gas inspector here says that 2 inches of mercury is 1 pound.

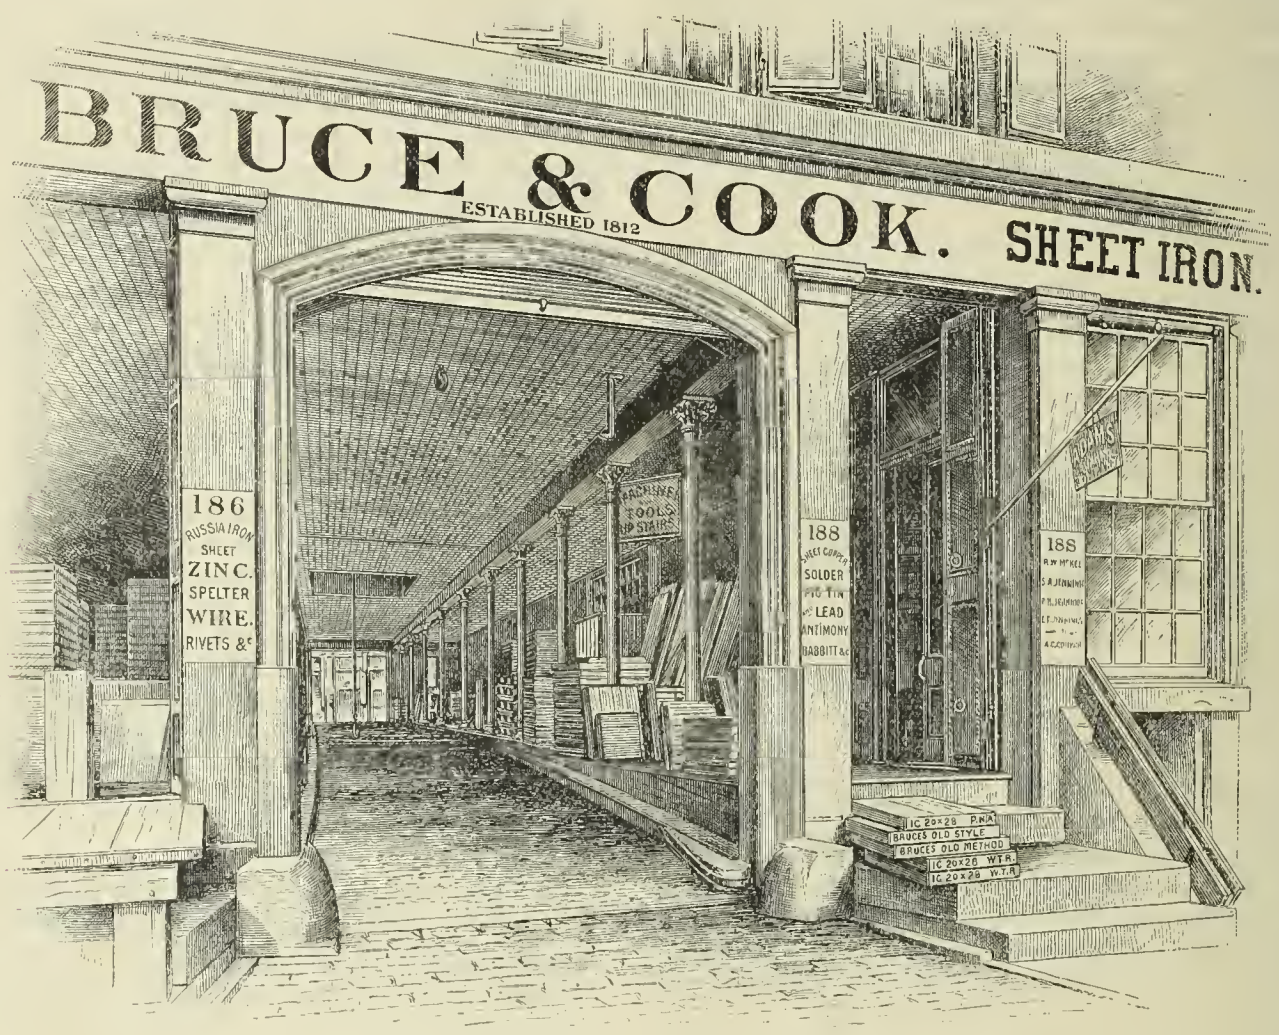
Answer.—The size of the opening between the mercury column and the gas is immaterial, for the pressure is entirely governed by the hight of the column of mercury and has nothing to do with the size of the opening. The statement made by the gas inspector, quoted by our correspondent, is correct. As a matter of fact, however, 1 pound pressure is eqnal to 2.035 inches of mercury, but in all practical work it is considered as equal to 2 inches of mercury.

Stove Repairing.

From H. A. H., Sherman, Texas.—I would suggest that the Letter Box can be used at this season of the year to good advantage for the discussion of the various wrinkles used by those who have had experience in repairing stoves of all kinds. At the present timo I am interested in cleaning gasoline and gas stoves. Another field is the cleaning of the japan or black enamel goods, such as gasoline stoves, fire grates and steel ranges. So far I have been unsuccessful in cleaning this portion of theso goods without leaving a greasy or smoky look.

A PIONEER METAL HOUSE.

The completion of their eighty-fifth year in business has been marked by the well-known metal firm of Bruce & Cook of New York City by the execution of extensive alterations and improvements in their business premises at 186 to 190 Water street and 248 and 250 Pearl street. Few, if any, concerns in the tin plate and metal trade are better known to the readers of *The Metal Worker* in all parts of the country than this old established house, which, in its remodeled condition, we illustrate and describe herewith. Before proceeding with an account of the buildings and their equipment, however, it will be interesting to glance at the history and development of a firm who for the long span of 85 years have, while ever growing, remained rooted in the same spot of soil in which the seed of their present flourishing business was first planted.



A Pioneer Metal House —Fig. 1.—The Driveway

FOUNDATION OF THE BUSINESS.

In the days when New York City proper occupied but a comparatively small area at the southern end of Manhattan Island, Water street justified its name as being the thoroughfare which skirted the water front of the East River, occupying a position which South street holds at the present day. It was then flanked by buildings on one side only. The lower part of these houses were usually occupied by stores, shops and ware houses which catered in a large measure to the wants of the vessels moored at the wharves at the other side of the street. It was at the present No. 190 Water street, between Fulton and John streets, that John M. Bruce, whose portrait we present, the founder of the business of Bruce & Cook, started, in 1812, the year of the last war with Great Britain, a small tinsmith's shop. His store was in the front part of the building, while his family, according to the custom of those times, lived in the rear and above. Mr. Bruce had long in his possession a copy of a newspaper published in 1760, containing a description of "a most spacious and imposing building of brick, 24 x 35 feet and three stories high, just completed by the English Copper Company, on the west side of Water street, near Fulton." The readers of the paper were advised to go and see this new structure, which "gave such evidence of the thrift and business development of the City of New York and of the country." It was this "imposing building" in which John M. Bruce, at the age of 21, began business, and which he subsequently bought. Its walls remain standing and it constitutes a part of the premises of the present concern. While illustrating their ideas of spacious and commodious accommodation in their large five story warehouse adjoining it, the reverence of the existing partners for the past was too great to allow them to demolish this relic. It is now used mainly for office purposes, and has been thoroughly refitted and rearranged, as to its interior, during the present year.

THE FOUNDER.

John M. Bruce commenced his business without other capital than energy, perseverance, integrity and a thorough knowledge of his trade, which he had begun to learn at the age of 11 years. From his father, a native of Glasgow, Scotland, he must have inherited the sterling qualities which have made Scotchmen the most successful pioneers and business men in all parts of the globe. He lost his parents, however, at an early age, and was thrown on the world when little more than a child, making his start in life, as he often said, with nothing but "an English shilling and his mother's Bible." Punctuality, enterprise, sobriety and scrupulously just dealing were among the characteristics which assured to the young tradesman the success he quickly achieved.

These qualities early gained for him the confidence and esteem of all with whom he came in contact, and his business grew apace. Soon after his start, it is recorded that one day, while Mr. Bruce was sweeping off his sidewalk, a prominent dealer in tin plate who saw him as he was passing along said to him:

"Mr. Bruce, I have watched your business growing and like your pluck and push, and I would like to sell you a load of tin" (which in that day was 12 boxes to a load).

"But," said Mr. Bruce, "I do not need so much, and will buy as I need the tin."

"Oh," said the dealer, "I will trust you for it."

The result was a sale, with Mr. Bruce's first note for 30 days. After the delivery of the goods Mr. Bruce figured out the exact amount it would be *per diem*, and laid aside that sum each day, so that when the note came due he had the cash to pay for it. An interesting relic of this period in the history of the business is still treasured by the successors of Mr. Bruce. It is in the shape of the pair of shears originally used by the founder of the firm. They are large wrought iron shears of English make, at least 100 years old.

John M. Bruce, Sr

AS AN IMPORTER.

A few years after his start in business John M. Bruce undertook a business trip to Europe. While there he made arrangements for the importation of foreign metal goods, to which branch of the business he subsequently devoted himself exclusively. This policy was continued during the earlier years of the house, and in course of time a very large business, done exclusively in imported goods, was built up. The reputation of the establishment for square dealing became very high, and Mr. Bruce took a pardonable pride therein. His sensitiveness in this respect was proverbial among his associates. One day a sea captain brought his wife into the store to select some cooking utensils. The lady was captious and inclined to disparage the goods shown to her by Mr. Bruce, despite his positive assurance of their good quality. After a time he quietly returned the pots and kettles to the shelf. The woman begged him to take them down again, as she needed them.

"Madam," said the merchant, "I shall sell you nothing. You doubted my word," and nothing would persuade him to relent.

John C. Cook

John M. Bruce, Jr.

Russell W. McKee.

Spencer A Jennings.

Philander R Jennings.

Frank C. Jennings

CHANGES IN THE FIRM.

In 1840 the oldest son of Mr. Bruce, on reaching his majority, was admitted into partnership under the name of John M. Bruce & Son. Subsequently James T. Bruce, the second son, became a partner in the concern, the style being then changed to John M. Bruce & Sons. In 1850 Mr. Bruce, Sr., retired from business. He died in 1872.

The house in 1850 became known as John M. Bruce's Sons. Franklin W. Bruce, the youngest son of the founder, was added to the partnership in 1852. On the retirement of his older brothers, in 1855, he associated with himself in partnership John C. Cook, who for a number of years had acted as bookkeeper to the concern, the firm name being changed to Bruce & Cook, a style which it has since retained. Subsequently Franklin W. Bruce retired from the business and his place was taken by John M. Bruce, majority, is attached to the house as a salesman on the road.

GROWTH OF THE ESTABLISHMENT.

Finding a pressing need for enlarged premises, to accommodate the requirements of his growing business, a five-story building at 186-188 Water street, adjoining the original structure occupied and purchased by Mr. Bruce, was erected by him about the year 1840. In 1863 further space was imperatively called for, and the property im

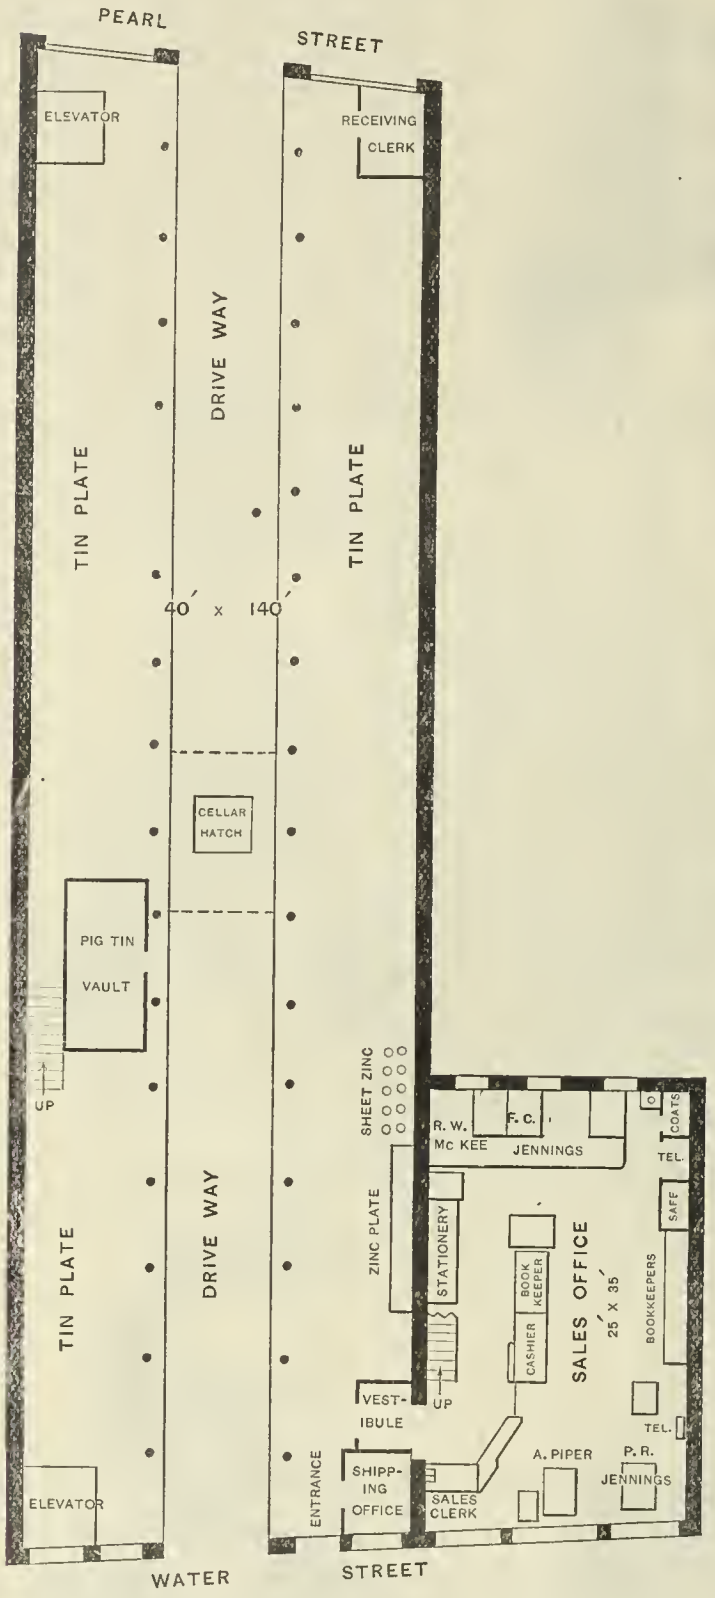


Fig. 2.—Plan of First Floor.

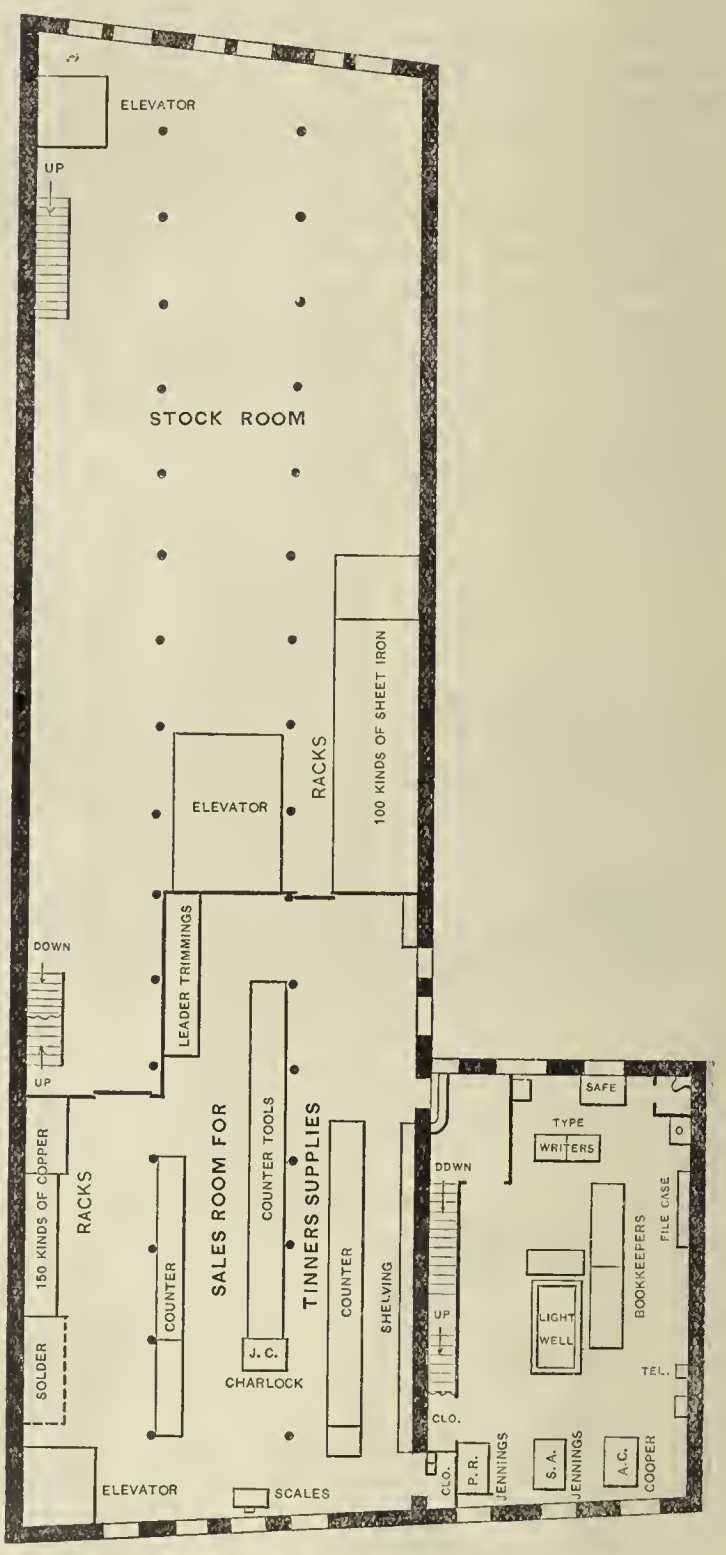

Fig. 3.—Plan of Second Floor.

Jr., who died in 1884. Mr. Cook died in 1892. Of the earlier members of the firm, the only survivor is Franklin W. Bruce, the third son of the founder, who for the past 25 years has made his residence in Paris, France. The present firm of Bruce & Cook are composed of Russell W. McKee, Spencer A. Jennings, Philander R. Jennings and Frank C. Jennings. Mr. McKee, the senior member, entered the service of the house in 1855, succeeding Mr. Cook as bookkeeper on the latter's advancement to a partnership. The Messrs. Jennings are nephews of the late John C. Cook. It is interesting to know that a John M. Bruce, of the fourth generation, who has just reached his mediately in the rear of this building, and facing on Pearl street, was acquired by the firm. Here they put up a similar six-story building, connecting with the Water street structure, thus forming a spacious single building 140 feet deep and 40 feet wide, extending clear through the block. The entire edifice is constructed in the most substantial manner. Its walls are 3 feet thick, with massive timbers and girders, each of the four upper floors being supported by numerous iron pillars. These floors rest upon a row of strong iron columns with solid masonry, making them absolutely free from vibration. The ground floor of 186-188 Water street is occupied by a

roomy driveway, flanked by shipping platforms extending the length through from street to street, as shown in Fig. 1. Thus a number of trucks can be loaded or unloaded at the same time nnder cover. The trucks enter at the Water street side and emerge on Pearl street. This arrangement conduces materially to convenience and rapidity in the shipment and delivery of goods.

THE OFFICE DEPARTMENT.

As has been seen, the present sales office of Brnce & Cook occupies the same grounnd and the same building in which the house was founded by John M. Bruce in 1812. What was then the cellar of the dwelling house was used for the storage of tin plate, and the front of the first floor was used for a sales department, while the back rooms and npper portion of the house were used for the family dwelling. The changes which have been made by the house in the celebration of their eighty fifth anniversary are shown in the illnstrations presented herewith. A plan of the first floor of the building occupied by the firm at the present time is given in Fig. 2, the original building being shown at the left of the plan. The main entrance to the building is at the right of the driveway on Water street. After passing the office of the shipping clerk, the vestibule is reached, which enters the sales office on the first floor, and in the corps employed and the eqnipment of the building, a special feature of the business of the house is brought to light. To many in the trade, the name Bruce & Cook is associated with large importations, and of late years' large shipments of home products. This branch of the bnsiness is taken care of in the wholesale department, shown at the right of the plan of the second floor in Fig. 3, where the attention necessary for the proper care of their larger trade is given.

A specialty has been made by the house of catering to the wants of the small buyer, whether he makes his appearance in the sales office or expresses his desires for goods and credit by correspondence. If he appears in person, the sales clerk at the entrance directs him or carries his card to the proper member of the firm. This trade receives the special attention of P. R. Jennings, whose desk is at the front of the building at the right, and he is assisted in this work by Angust Piper. A stenographer is located conveniently to receive their correspondence, and the telephone is at hand for communication with nearby and ont of town trade. The desk of the cashier and bookkee; ers occnpies the middle of the room, with the safe and stationery racks conveniently located.

At the rear of the building, the desks of the oldest and youngest members of the firm are located. The desk of Russell W. McKee is at the left, and conveniently near it is that of F. C. Jennings. A view in the sales office is given in Fig. 4, which will be familiar to many who have visited it and afford a pleasure to many who have long traded with the firm without a visit.

On the floor above, S. A. Jennings, whose desk is at the center and at the front of the building, devotes his attention to the wholesale trade. Associated with him is A. G. Cooper, whose desk is near at hand, and another desk is provided for P. R. Jennings, when his presence is desirable in the department for consultation. The view presented in Fig. 5 shows the arrangement of the wholesale office. This office is also equipped with file cabinets, typewriters, safes, and the necessary conveniences for handling the large business transacted in this department. On the floor immediately above, a private office is provided for use when it is necessary for the firm to hold a consultation.

Fig. 4 — View in Sales Office

SOLDER DEPARTMENT.

This part of the building is four stories high, and the top floor is occnpied by the solder making department. Here three furnaces are provided, with the necessary cooling tanks, storage racks and scales. Special attention is given to this department, and each member of the firm is interested in having the product turned out exactly as represented. The department is presided over by a snperintendent who has been in the employ of the house for 17 years. Solders of various grades are made, and each quality is dne to the proportions and different metals used in making them. Measnres are taken to prevent the possibility of a mistake in the mixtnre, and in the molds in which the different qualities are poured, so that the bnyer may know on picking up a bar of Bruce & Cook's solder just the quality it represents. When running full, this department has a capacity for turning out between 4000 and 5000 ponnds of solder per day. An elevator is provided for raising and lowering the materials for this department.

THE WAREHOUSE.

The first floor of the warehonse has a driveway leading through from Water to Pearl street, and near the center of the building, which is six stories high, is a special elevator for handling tin plates and heavy metals. This elevator operates through a well that is 10 x 14 feet in size. In the floor of the driveway is a hatchway which leads to the cellar or vanlt, in which a large

quantity of tin plate is stored. This building is 40 x 140 feet, erected on massive foundations and provided with a storage cellar so constructed and cemented as to insure dryness. Near the hatchway is a house, or vault building, for the storage of pig tin, and beside it is a stairway which leads to the upper floors. The left side of the building has an elevator at the front and another at the rear for handling stock. The space between is occupied by stacks of boxed tin plate. On the right, tin plate occupies a large space, but near the front a stock of zinc is carried, as shown in Fig. 2. This stock varies from 18 to 22 gauge, and the sheets can be furnished in different lengths and widths. Immediately at the rear of this stock of zinc plate is the stock of sheet zinc in rolls. At the Pearl street end of the building an office is provided for the receiving clerk.

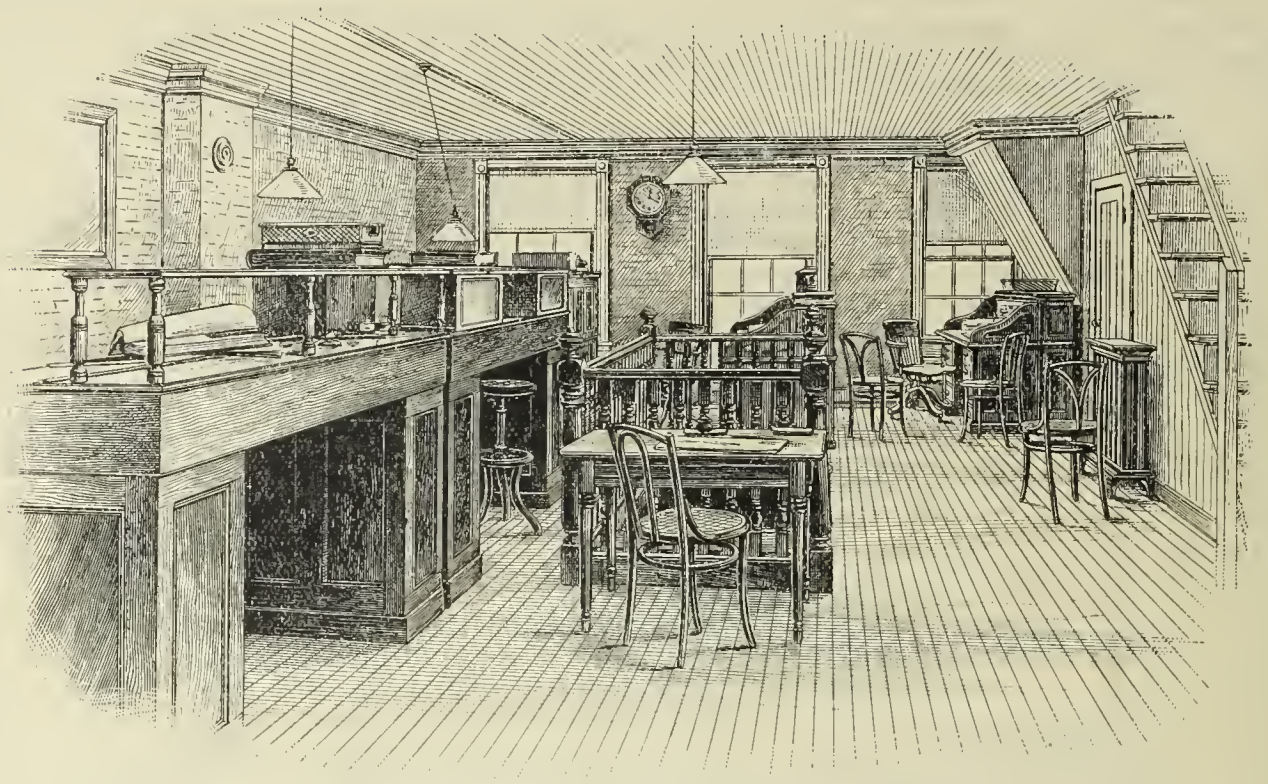

Fig. 5 — View in Wholesale Office

THE SALESROOM.

The second floor of the warehouse, shown in Fig. 3, is specially equipped for handling small trade and for carrying the smaller articles, which include an extensive line of tinners' supplies. This department is presided over by J. C. Charlock, a nephew of the founder of the house, who has been in the employ of the firm for 45 years, having begun service as an office boy, advancing to the position of shipping clerk, then serving as

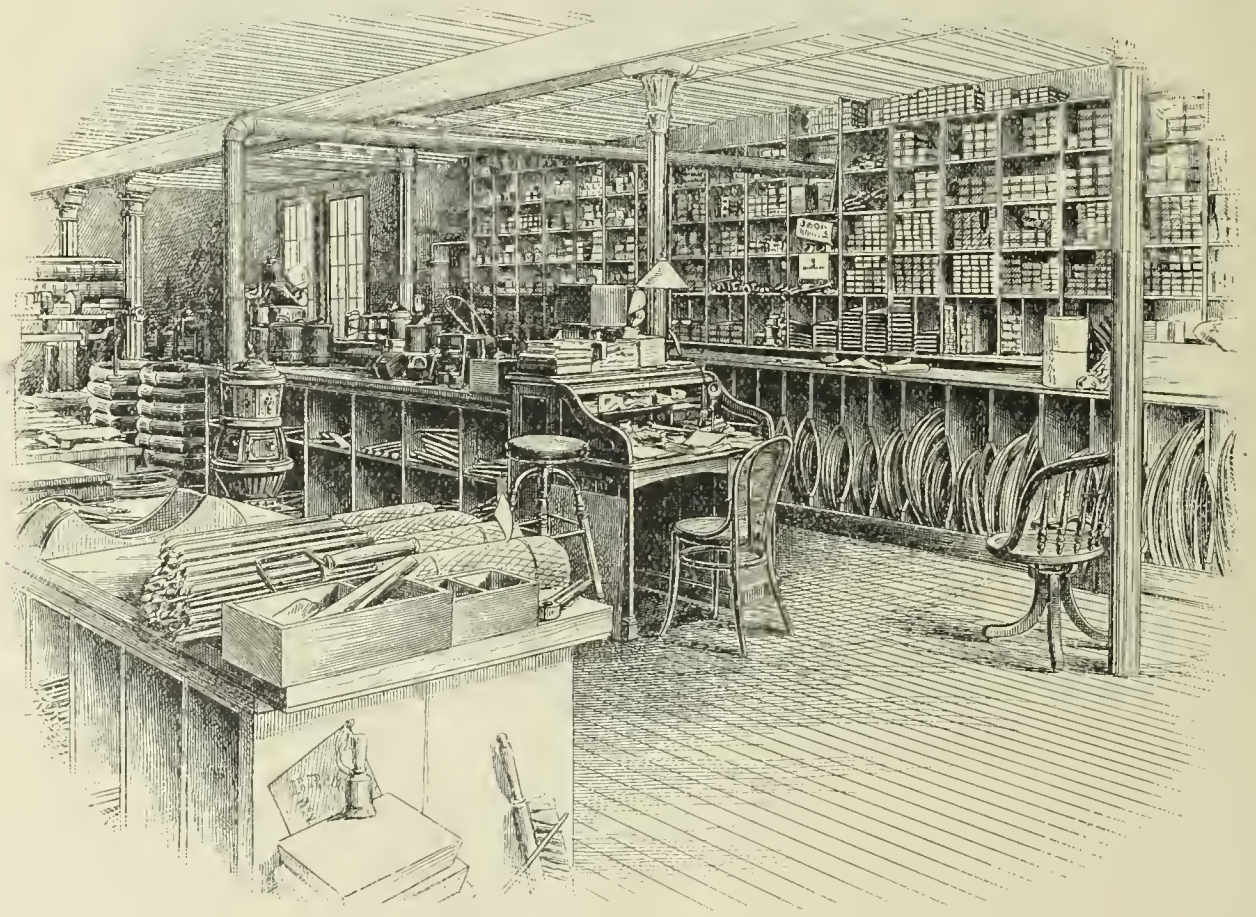

Fig. 6. — View in Retail Department

a traveling salesman on the road, and afterward being the city salesman for the house, and finally assuming charge of this important department.

On passing through the sales office and up the stairs to this department, the customer is in the midst of a large collection of such goods as he is continually using, and a view in this department is given in Fig. 6, which will be

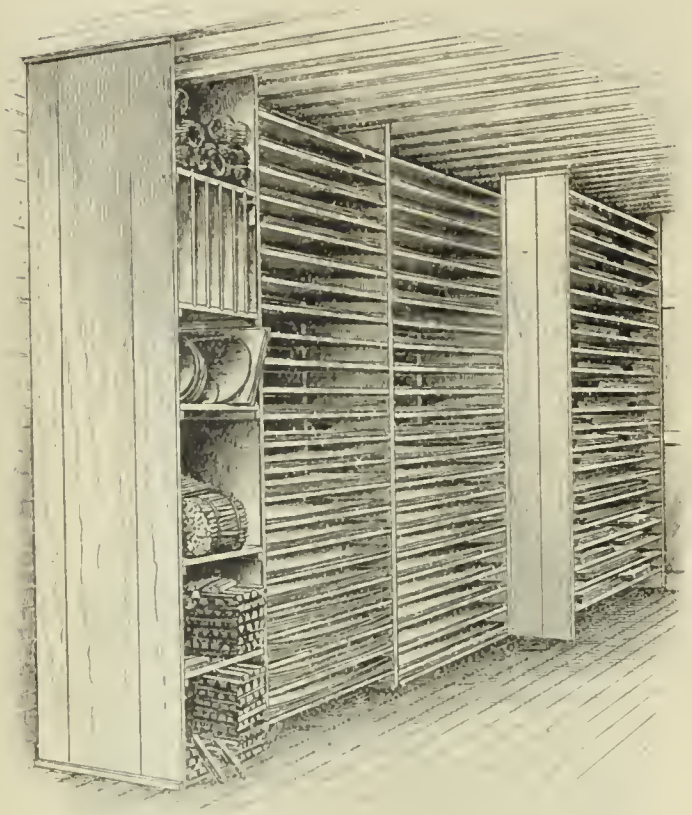

Fig. 7.—Rack for Sheet Copper.

familiar to the wives and daughters in the trade who include Bruce & Cook in their shopping list to secure some small supplies. The shelving along the right wall contains a line of plumbers' hand tools, as well as tinners' hand tools, and a complete line of various sizes of tinned and black rivets used by tinners. Here is also stored in convenient racks a large variety of sizes and qualities of tin plates, so that the purchaser may buy one or a dozen or more sheets, as his necessities require. Here likewise are found bucket ears, pump valves, brass, copper, tinned and black wire.

The counter immediately in front is arranged with bins underneath for the storage of wire of different sizes, plain, coppered and tinned. The center counter is provided with bins for soldering coppers and mallets, bucket handles and tinners' wooden ware. It also displays a variety of tinners' machines. In bins underneath are a complete line of roofing tools from the double seamers to be operated by the foot to the ½-inch and 10-inch tongs, with hand seamers and heavy mallets. This counter also contains a variety of gas, gasoline and charcoal and hard coal soldering furnaces. At the left is another counter with scales for weighing solder, and underneath the counter is solder for various purposes, in addition to that made in bars for the tinners, including solder in cakes for plumbers' use, made into three-cornered bars so that it may be cut by machines for canners' use, and wire solders for the use of electricians and others. At the left side of the building the floor space for a considerable distance is used for carrying a large stock of their various grades of solder. Racks above are provided for carrying a variety of conductor wire guards.

ONE HUNDRED AND FIFTY VARIETIES OF SHEET COPPER.

Just back of this the house have arranged racks on which they carry 150 varieties and sizes of plain and tinned, planished and corrugated sheet copper of different gauges and for different kinds of work. A specialty is made of this copper trade and sheets of many sizes are kept in stock. For the convenience of carrying a varied assortment of copper, the rack shown in Fig. 7 has been provided, and is the means of the house being able to fill orders of those who call or who send in their orders with a promptness that has been a benefit to all concerned. At the rear end of this salesroom bins are provided for leader and eave trough hooks and hangers, rain water cut offs, eave trough ends, spout heads and shoes, while the space near at hand is occupied by a variety of stove boards, stove pipe elbows, stove pipe dampers and other hardware specialties indispensable to the tinner.

THE STOCK ROOM.

In the rear is a large stock room, a special feature of which is a rack for carrying an assortment of sizes of sheet iron, which is shown in Fig. 8. These racks have a capacity for storing 100 different sizes and gauges of black and galvanized iron, enabling the house to fill an order for a sheet of iron of the special gauge and size where the buyer would have no use for a bundle of the material he needs. The balance of this floor is used as a general stock room. The third floor is covered with a stock of black and galvanized sheet iron. Racks are provided for the storage of metal lath, sheet iron siding, corrugated, galvanized and plain and painted Cycle roofing, known as continuous roofing tin in rolls. The fourth floor is occupied by a stock of annealed and unannealed tinned and black wire, conductor, eave trough, elbows, Russia iron in the original packages, and patent planished iron. The fifth and sixth floors are occupied by an electric motor

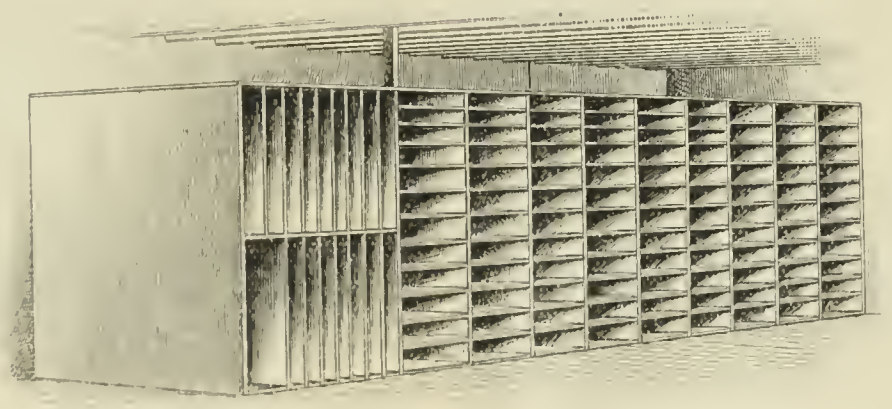

Fig 8.—Rack for Sheet Iron.

for operating the elevators, and a stock of metal shingles, rain water cut offs, and stove pipe elbows.

A SUBSTANTIAL BUILDING.

The big warehouse building was specially constructed for the heavy goods in it, the joists of the different floors being so close together in many instances that the use of flooring seems only for the purpose of preventing things from dropping through. These joists are supported by massive girders. The building possesses a floor space of 37,000 square feet, all of which is utilized not only for the best interests of the house, but also so that they can cater to the

wants of their customers to the best advantage. The two buildings are connected on each floor by archways provided with metal covered sliding doors as a protection against fire. Similar doors divide the various departments on each floor of the larger building. A notable feature of the establishment is the complete telephone system. The desks of the partners and their assistants, as well as those of the heads of departments, are each provided with a portable telephone, affording instant communication between the different parts of the building as well as with the city and long distance telephone systems. This arrangement is found most valuable as a time saver, obviating much delay and running up and down stairs by the clerks and employees generally.

APPRECIATIVE CUSTOMERS.

As we have shown, the history of this pioneer American metal house is practically coeval with the rise and development of New York City as the commercial metropolis of the United States. Very few metal firms in the country antedate it in age, and the growth of its business has kept pace, step by step, with the commercial growth of the city and the country at large. Beginning in the humblest way, the business of Bruce & Cook has extended with the lapse of time until to-day its ramifications reach to all parts of the United States. Besides doing a very large local business, the customers of the firm are to be found from Maine to Texas. Some of these have dealt steadily with Bruce & Cook for half a century or more. We have seen a letter (one of many of similar tenor in the possession of the firm) received recently from a tinner and sheet metal worker in Florida, who has been buying from them since 1848. In his letter, while paying a high tribute to the house, he makes the statement that in all that half century there had never been the smallest cause of complaint or misunderstanding in connection with any of his dealings with the firm.

Artistic Sheet Metal Work.

We have received from the Canton Steel Roofing Company, Canton, Ohio, a copy of their 1898 catalogue. It is a pamphlet of oblong shape measuring 12 x 9 inches, containing 64 pages and sumptuously illustrated. This concern are manufacturers of every kind of sheet metal goods, including copper, tin, galvanized, zinc and painted sheets. The first pages give rules for the metal ceiling business and the special features of the Canton Steel Roofing Company's ceilings, which they describe as "not the cheapest, but the best." Following this comes the illustrated portion of the catalogue, beginning with ceiling plates of continuous design, and centers, ceiling panels and border designs; then borders and miter plates, continuous plates, moldings, fillers and corner leaves, fillers and moldings, cornices, centers, closed and ventilating wainscoting, ceiling designs, side wall designs, panel ceiling designs, while a number of very elaborate and handsome styles are illustrated under the various combination designs. Sectional views showing constructive features follow; then come other illutsrations of cornices and stamped zinc ornaments, the latter covering 15 pages, with a number of illustrations to each page. Stamped siding and skylights complete the illustrated portion of the volume. The last two pages are devoted to a telegraphic code and a few testimonial letters and references, and the back cover carries an index.

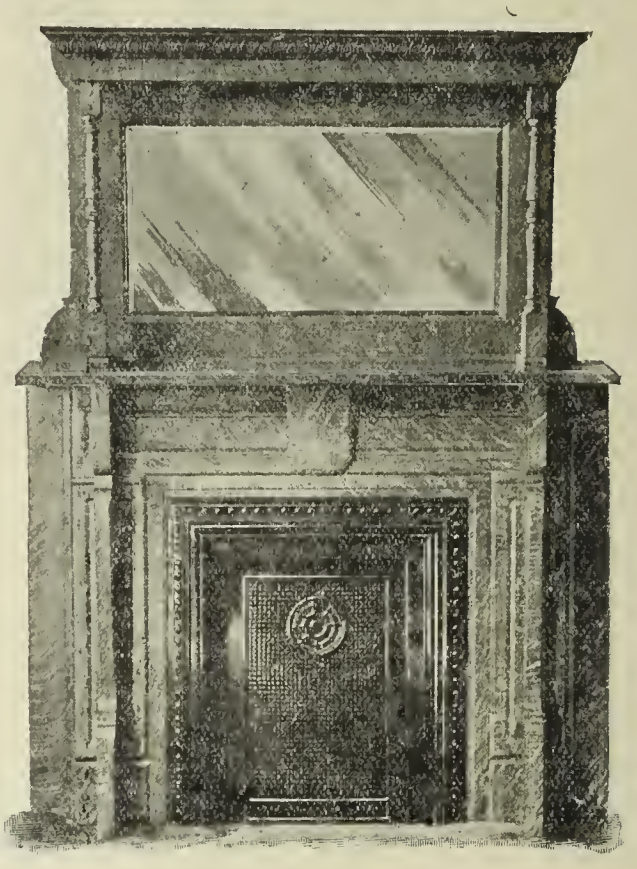
Senator Hale of Maine has introduced into Congress a bill providing for the construction of dry docks at Portsmouth, N. H.; Boston, Mass.; Algiers, La., and Mare Island, Cal., and for the enlargement of the Brooklyn, League Island and Norfolk docks, the appropriation for Portsmouth being $1,000,000; Boston, $1,350,000; Algiers, $500,000; Mare Island, $500,000; Brooklyn, $286,556; League Island, $286,556 and Norfolk, $160,000.

The New York Chamber of Commerce has sent to the Secretary of War a report on harbor defenses, in which such immediate action is asked for as will provide a force of trained artillerymen for the proper manning of the seacoast defenses of the country. It is suggested that 110 seacoast batteries, requiring an increase of about 4000 artillerymen, are necessary. Secretary Alger has sent the communication to Congress with his approval.

The sum of $200,000 has been appropriated by Congress for the purpose of getting supplies to the distressed miners on the Klondike.

Steel Mantels

The mantel of to-day with all its beauty is the outgrowth of the shelf above the fire place of olden times. Then it was without great pretensions of beauty in itself, but was a thing of utility primarily. In the modern house, however, the mantel is conspicuous for its beauty as a piece of house furniture as well as utility. Materials of various kinds have been used for the purpose. Woods of different kinds and finish, as well as slate, marble, onyx, &c., are employed. The newest material for his purpose is sheet metal. The Steel Mantel Company of 19 Vandewater street, New York City, are putting on the market a line of handsome mantels manufactured from this material. They have secured for the purpose of manufacturing these mantels large presses of great power, and have provided for use in them dies of various designs, so that the whole face of the mantel can be stamped



Steel Mantels.

up from one piece of steel. These mantels are arranged with openings so that stove pipe may be connected with a chimney behind them, and some are provided with openings for a hot air register. Being made of steel, they do not warp or crack and the settling of the building cannot break them. The company also have a special method of enameling their surfaces in imitation of various woods, and all colors of stone from dark slate to marble, and also elaborate patterns of onyx, the design and finish being adapted for all kinds of dwellings from handsome apartment houses to suburban cottages. The advantage of steel for this purpose is found in the durability and also in the low cost. The upper or cabinet portion of these mantels is made of natural wood finished with plate glass mirrors, and can be made as elaborate as is required by the building in which they are to be used. They are easily set up and can be delivered in all parts of the country in good condition.

The A. Fisher Mfg. Company, Hamilton, Ohio, have closed a contract for the enlargement of their present building by having another story placed on the top, and they will also add two additional three-story buildings to their plant. The improvements will give an addition of some 14,000 square feet of floor space.

The catalogue issued by the F. O. Smith Wire and Iron Works, Chicago, Ill., is a volume of 90 pages and presents a vast number of illustrations of the goods that this concern manufacture These include Fence Railings, Jail Work, Roof Crestings, Builders' Work, Stairs, Guards, Vases, Fences, &c. In addition to the illustrations and lists of sizes, prices, descriptive particulars are presented where necessary.

The latest large consolidation announced is that of the three largest cracker manufacturing companies in the United States. These concerns have an aggregated capital of $25,000,000, and the capitalization of the new combination is placed at $55,000,000.

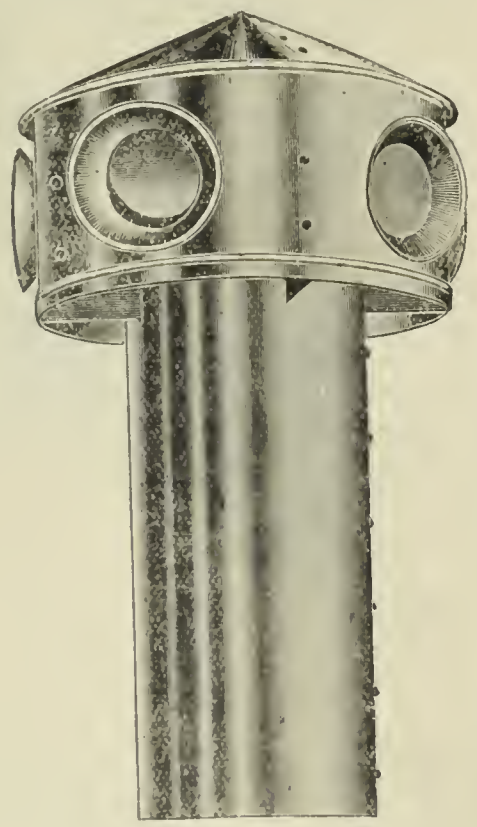
SHEET METAL WORK.

Meeting of Sheet Iron Manufacturers.

The Association of Iron and Steel Sheet Manufacturers, composed of black sheet makers, held a meeting in the Conestoga Building, Pittsburgh, on Tuesday, December 21. J. G. Battelle of Piqua, Ohio, was chairman. The present condition of the black sheet trade, together with the low prices prevailing, were gone over and fully discussed, and action was taken on some matters which it is believed will be of considerable benefit to the trade. Nothing special was done in the matter of prices beyond informal discussion. It was the sentiment of those present that in view of the higher prices for billets and sheet bars better prices for sheets should be obtained, but it was left to the discretion of each manufacturer as to how best to accomplish this. Some routine matters were disposed of and the meeting adjourned.

New Form of Chimney Top.

Charles Kuhnhold & Co., 221 Beaver avenue, Allegheny, Pa., are manufacturing a form of chimney top illustrated in the accompanying engraving. This top was



New Form of Chimney Top.

patented very recently, and has certain features which, it is claimed, make it particularly effective as an exhauster Over the flue pipe is an inverted deflecting frustum which throws the hot gases out at the side, while surrounding the top of the pipe as indicated in the engraving, is a band with circular holes in it, flat valves preventing the passage of the wind to the openings in the flue pipe. The arrangement is such that the wind closes these flat valves on one side of the chimney and at the same time opens them on the other side, so that the top will draw constantly in all weathers. These chimney tops are made in all sizes from 3 inches up.

The Wilmington Cornice Works, Charles H. Blaine, proprietor, Wilmington, Del., favor us with a copy of their 1898 calendar, which they distribute to the trade in the interests of their line of work. The greater part of the card carrying the calendar leaves is occupied with an engraving showing a beautiful valley scene in the Tyrol. Incidentally reference is made to Copper and Iron Cornices, Metallic Skylights, Metallic Ceilings and other sheet metal work done by this concern.

Eave Trough and Conductor Pipe.

The regular annual meeting of the United States Eave Trough and Conductor Pipe Association was held in the Seventh Avenue Hotel, Pittsburgh, on Tuesday, December 21. C. D. Clark of Peoria, Ill., was president and Alex. Glass of Wheeling Corrugating Company of Wheeling, secretary. The meeting was well attended, about 15 concerns being represented in person and a number of others by proxy and letter. The present condition of the eave trough and conductor pipe trades was thoroughly gone over, and it was the sense of the manufacturers present that some effort should be made to obtain more remunerative prices. For considerable time past eave trough and conductor pipe have been selling at prices which leave little or no profit, and for the coming year a determined effort will be made to secure better figures. As a step in this direction, the list price of 2-inch conductor pipe was advanced from 12 to 13 cents per foot, and on 4½-inch eave trough the list price was advanced from 17 to 18 cents. Other matters of considerable interest to the trade were discussed, but the above embraces the principal action taken. Officers were also elected as follows :

President, C. D Clark, Peoria, Ill.
Secretary, Alex. Glass, Wheeling, W. Va.
Treasurer, Edward Langenbach, Canton, Ohio.

These officers with the following were chosen as the Executive Board : C. B. Sills, Niles, Ohio ; J. H. Eller, Canton, Ohio and G. M. Verity, Cincinnati, Ohio.

FLASHINGS.

The Canton Steel Roofing Company, Canton, Ohio, invite the trade to save money by sending orders direct to them for Continuous Panel Ceilings, Skylights, Cornices, Plain, Corrugated, Crimped, Beaded and Stamped Roofing and Siding and other sheet metal work. All this announcement is presented on a card which they are sending to the trade.

An explosion occurred last week in the oil room of the Pennsylvania Metal Ceiling Company's factory, at Twenty-third and Hamilton streets, Philadelphia, owing to the placing of a lighted candle near a benzine tank. The fire which resulted did damage to the building and stock amounting to $5500, all of which is covered by insurance.

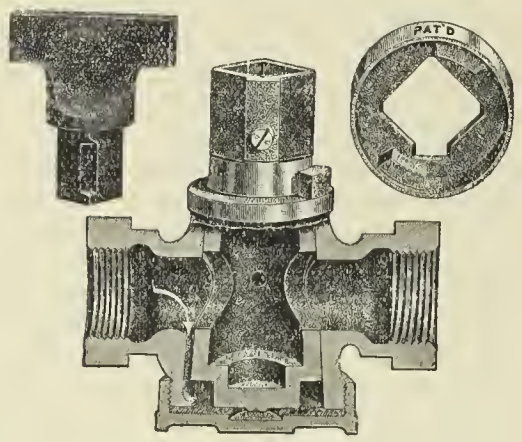
Marlin & Co., Incorporated, Twenty-fifth street and Liberty avenue, Pittsburgh, Pa., manufacturers of Eave Trough and Conductor Pipe, have received a contract from the Consolidated Traction Company of Pittsburgh for roofing and skylighting a number of buildings, including car barns and stables of that concern in Pittsburgh. The contract embraces the putting on of 3000 squares standing seam tin roofing, between 7000 and 8000 feet of skylights, several thousand feet of cornice and a large quantity of conductor pipe. Marlin & Co., Incorporated, are now at work on this large contract and have a considerable part of it already filled. It is the largest contract of this kind given out in Pittsburgh for a long time, and competition to secure it was very keen. The facilities of Marlin & Co. are such that they can take care of a large contract of this kind to very good advantage. They also have a number of other smaller jobs on hand and are running their new shops at the above location full time.

The firm of Berger Brothers, Philadelphia, Pa., manufacturers of Conductor Pipe and Gutters, Tinners' Hardware, Roofers' Supplies, &c., have been incorporated, and in the future will be called Berger Brothers Company, the directors being: President, W. H. Berger; secretary, William Barth, and treasurer, G. B. Geiser.

HEATING AND PLUMBING.

The H. M. Inverted Key Curb Cock.

In the H. M. inverted key curb cock, made by the H. Mueller Mfg. Company, Decatur, Ill., the manufacturers state that it has new and special advantages for this purpose. As shown in Fig. 1 the key of this cock is inverted, or, in other words, the large end of plug is at the bottom instead of at the top as in the ordinary cock.



The H M. Inverted Key Curb Cock.—Fig. 1.—Sectional View.

Owing to its construction in this manner there is no liability of its sticking, as a slight blow on key with wrench would tend to loosen the plug and permit of the key turning very easily. As shown in the sectional view the water enters the cock and passes through the by-pass under and around the key, thus forcing it gently upward so that there is no liability of leaking under the highest pressure that may be put on it. The most important feature of this cock is the H. M. patent cap, shown in Fig. 2, which

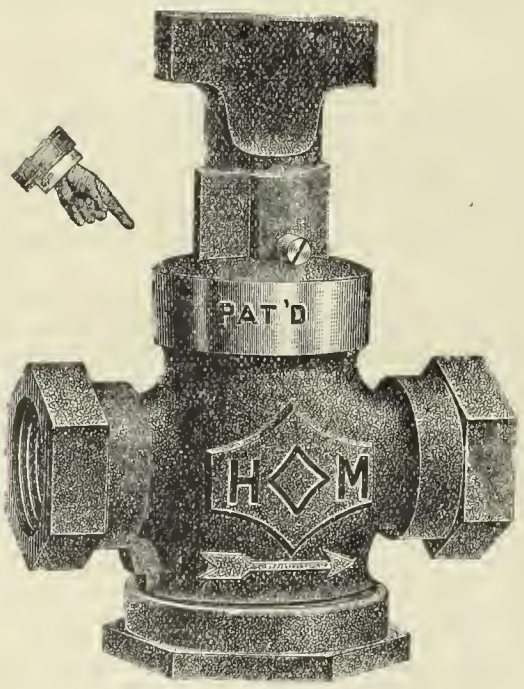


Fig. 2 —General View, Showing Sand Cap.

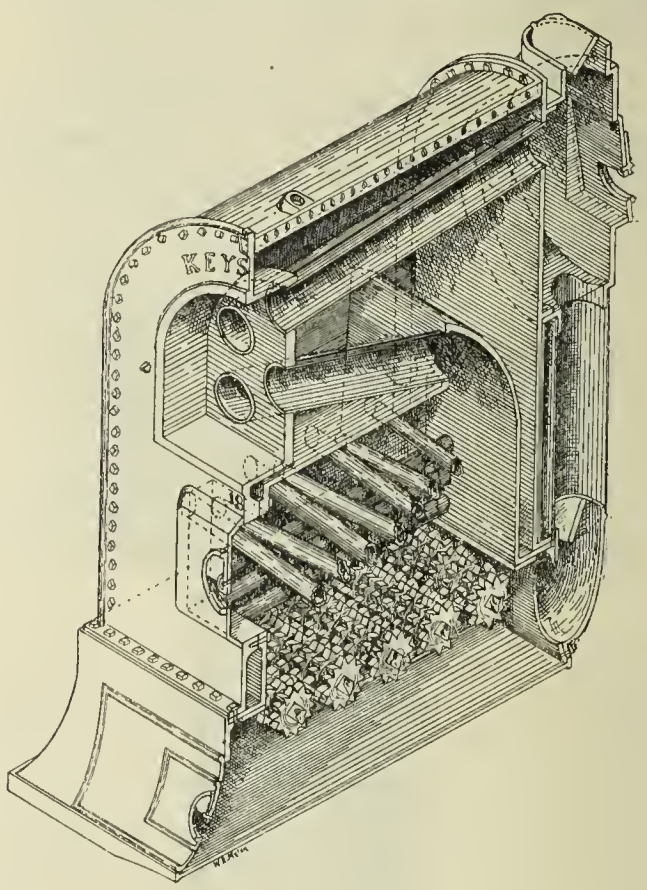
prevents the entrance of any dirt, sand or gritty material from working its way around the key, which otherwise might cause leakage after a very short time. This cap also performs another function—that is, the square of cap fitting square on key together with lug on body of cock forms a strong check, so that the operator always knows when cock is fully open or fully closed. These cocks, the manufacturers state, are made from red brass metal and guaranteed not to leak or stick. Any plumber or water works official wishing to investigate the merits of the cock is invited to write the manufacturers, who will take pleasure in giving full information.

The Keystone Boiler.

The special claim made for the Keystone boiler is its economical consumption of fuel. The boiler is the invention of Roy W. Jacobs, and is being manufactured by the Keystone Boiler Company, Huntingdon, Pa. A feature of the construction is the use of copper on account of its property of readily transmitting heat. A broken view of the boiler is presented herewith showing the construction, which consists of an outer water chamber through which hard rolled seamless copper tubes run to increase the heating surface. Three of these tubes are 1¼ inches in diameter and run lengthwise of the boiler in the fire chamber. Seven tubes of the same size run across the boiler just over the fire. The fire travel is through a number of 4-inch copper tubes, running through the lower tubes to the front of the boiler, where a rise is made to the return tubes above. All of the tubes are inclined to facilitate the oper-



The Keystone Boiler.

ation of the boiler. The grate consists of a series of cog wheels supported on square bars, giving strength and provided with ample space for the entrance of air to support combustion. The boiler is adapted for burning either coal or gas and can be furnished for either fuel. It is made for both steam and hot water heating in four sizes, with grates respectively 16 x 26, 17 x 27½, 18 x 28 and 20 x 36, and rated to carry 550, 700, 1075 and 1900 square feet of direct hot water radiation or 325, 500, 750 and 1350 square feet of direct steam radiation. The company have prepared for distribution a hanger showing different broken and sectional views of the boiler and a circular giving full dimensions and prices.

A Christmas souvenir that comes to us from Russell & Co., 89-91 Centre street, New York, through the courtesy of W. A. Russell, is a thing of beauty and, what is more to the purpose, of utility to those who are wise enough to make use of tobacco and delicate enough in their taste to appreciate tobacco in perfect condition. The gift, for it is more than a souvenir, is a cup of porcelain imitating alabaster handsomely mounted in brass. The cover is a compound affair and arranged most conveniently with a perforated top holding a blotter, which can be kept moist. When the winter comes with its excessive dryness, the smoker knows how much his happiness depends on having his tobacco carry the proper degree of moisture. We don't

want to say too much about this gift for fear that Russell & Co. will be overcowded with requests for samples, and we ought to add that they are only sending it to their good customers, and they have only a few dozen more left to send to those who order their Floor and Ceiling Plates.

NOTES.

Sturtevant & Hazeltine, Pittsfield, Maine, have just finished putting in the heating and ventilating plant at the new Harland Avenue School House. The system is the latest type of the Smith & Anthony Company. They also did the plumbing in the building.

The plumbing firm of West & Richardson, McKeesport, Pa., are putting in a hot water heating system in the residence of Prof. E. P. Murphey, at Port Vue.

We have received notice that the partnership lately subsisting between Fred. D. Johnson and Henry C. Adams, under the firm name of Fred. D. Johnson & Co. of 80 Centre street, New York City, was dissolved on December 15, 1897, by mutual consent. All debts owing to said partnership are to be paid to Henry C. Adams, who is made sole liquidating partner, at the office of Fred. D. Johnson, 80 Centre street, New York City, and all demands on the partnership are to be presented to Henry C. Adams. All the stock, fixtures, lease and contracts are henceforth vested in Fred. D. Johnson, who will continue the business.

The Minnesota State Board of Commissioners of Practical Plumbing have given notice that on January 5, 1898, they will meet at 10 a.m., at Duluth, Minn., to examine all applicants, as provided for by chapter 319 of the general laws of the State, approved April 23, 1897, entitled "An act to prevent incompetent persons from working as journeymen plumbers or conducting the business of plumbing in any town having a population of 10,000 inhabitants or more which has a system of sewer or waterworks in the State of Minnesota." Application blanks can be had at 230 West First street, Duluth, Minn. D. J. Harrington, secretary, St. Paul ; A. W. Scott, president, Minneapolis.

March R. Story & Sons, 121 Lake street, the Chicago agents of Russel Wheeler & Son, Utica, N. Y., have made the following sales in the past ten days of the Palace Queen and Palace Regent Furnaces: Four to P. A. George and four to Mrs. Eva Schermann, for apartment houses; two to W. L. Peterson, five to J. Trelease and one each to J. E. Edwards and Mrs. M. J. Sullivan.

The Buckingham-Routh Company, New Haven, Conn., report a considerable improvement in their line of business. Among contracts now on hand are the following : A Carton Furnace for Ritchie & Johnston's new house, the plumbing and heating of L. Leeds' five new cottages, a Volunteer Boiler for Mrs. Myrick's house, a Hornet Heater for W. H. Gage's house, the same for Miss Thompson's house, a Volunteer Boiler in George Butler's house and several others. The company have also recently finished the cornices and skylights for the new Pitkin blocks.

Ole Olson has opened a plumbing establishment at 117 North First street, Ishpeming, Mich.

H. H. Rice, for many years connected with the Turner Heater Company of Bristol, has taken office and showroom with the Wolcott & Parret Company, on Crown street, New Haven, Conn., where he will be glad to point ont to any one interested the merits of the Turner & Rice Heaters, which he represents. Mr. Rice has recently taken contracts to furnish Heaters for Mr. Thompson's new house, George D. Wharton's two-family house and a house in Hamden for Samuel Flight.

James R. Vance of the Vance Boiler Works, Geneva, N. Y., has recently been granted patents for a new boiler which will be called the Black Diamond.

We are in receipt of a four-page circular from E. M. Caswell, 9 Bowker street, Boston, Mass., relating to the Common Sense Drying Machine. The illustrations show a small engine connected with a blower which delivers the air into a chamber formed of sheet metal in which are placed steam coils. The drier is said to be adapted for use where moisture is to be removed and a perfectly dry atmosphere is required. Another illustration shows the machine used in connection with a lumber drying kiln, and a large portion of the circular is devoted to testimonial letters from those who are using the drier with satisfactory results.

At the annual meeting of the Whitlock Coil Pipe Company, held recently at the office of the company in Elmwood, Conn., the following Board of Directors was chosen: Ernest Cady, Samuel O. Prentice, Theodore M. Lincoln, Samuel Taylor, W. L. Shepard, Elmer G. Clark and John W. Crane. The directors elected the following officers : President, W. L. Shepard ; vice president, John W. Caner; secretary and treasurer, Henry R. Hovey. Messrs. Shepard and Crane have been president and treasurer respectively of the company for several years. Mr. Hovey was for several years with the Sullivan Machine Company of Claremont, N. H., and for nine years was head bookkeeper of the Farmers and Mechanics' National Bank in Hartford.

The Richmond Hot Water Radiator Company, Baltimore, Md., have been incorporated, with a capital stock of $15,000, divided into 150 shares of a par value of $100 each. The incorporators are Cornelius C. Hazlett, George H. Rogers, William C. Codd and Frederick S. Gassaway of Baltimore, and Robert W. Coffee of Richmond, Va.

The Stradling Plumbing & Heating Company of Utica, N. Y, have been awarded the contract for furnishing the plumbing, steam heating and sprinkler systems for the Oriskany Falls Knitting Mills.

The secretary of the American Society of Heating and Ventilating Engineers announces that the ballot for officers for 1898 has been forwarded to members, and he wishes to call attention to the fact that neglect to indorse the envelope with the name of the voter invalidates the vote. Any New York member who has so failed to indorse his vote can secure a new ballot and the return of his vote by writing to the secretary.

Fred. Wild & Co., El Paso, Texas, inform us that they have purchased the business of L. Gasser and are now prepared to do plumbing, tinning and metal work of all kinds. They will carry a fine line of Stoves.

Among the journeymen examined by the Milwaukee, Wis , Plumbers' Examining Board were many who could neither read nor write the English language, but they were asked the questions, examined orally and tried in practical work, the commissioners concluding that illiteracy did not bar out efficient workmanship.

Swinton & Co., Port Jervis, N. Y., have been awarded the contract for heating, with the Bundy system of hot water, the six large sanitarium buildings of the Sisters of St. Dominic, at Forestburg, N. Y. This is said to be the biggest contract of the kind ever taken by this firm, as 121 Radiators, 2 carloads of Pipe and 1½ tons of Steam, Globe and Check Valves will be used. The Valves are all of the Jenkins make. Five boilers will be used.

A. P. LaChapelle of West Medford, Mass., has sold his plumbing business to Palmer Brothers of Somerville.

The St. Joseph Pump & Mfg. Company, St. Joseph, Mo., publish a catalogue of the Perfection Water Elevator and Purifying Pumps of their manufacture. The various forms of these Pumps are illustrated and described and the details of their mechanism clearly explained. A number of testimonial letters speak in high terms of the excellence of these Pumps.

A price-list of the Kennedy Valve Mfg. Company is just issued from their general office at 75 John street, New York City. It is an oblong pamphlet of about 100 pages and gives illustrations, prices, descriptive particulars and all necessary information concerning the extensive line of Valves and Gates made by this concern. These Valves are for water, steam, gas, oil, ammonia, acids, &c., and include Globe, Angle, Check, Corner and Radiator constructions for high and low pressures.

A calendar that comes to us from the Folding Bath Tub Company, Marshall, Mich., manufacturers of Bathtubs and Store Fixtures, is a decorative sheet 15 x 20 inches in size, adorned at the top with a charming engraving and carrying at the bottom the 12 monthly calendar sheets. The background is tinted and the printing is in black and red.

The Crescent Brass & Iron Company have purchased the plant and assets from the Union Trust Company, receiver of the Crescent Brass and Iron Works, Detroit, Mich., and are continuing in the same line of manufactures, which consists of Lawn Sprinklers and Plumbers' Supplies. Their new catalogue devoted to these goods is ready, and they will be glad to send one of them on request.

The extensive establishment of Crook, Horner & Co., dealers in Plumbers' and Machinists' Supplies, at Howard and Saratoga streets, Baltimore, Md., was partially destroyed by fire on December 20, entailing a loss of about $150,000 to stock and building.

The Eastern manufacturing potters have dissolved their connection with the Western manufacturing potters, and the result may be that the operative potters will not get the 12½ per cent. advance in their wages promised at the joint meeting at Atlantic City last summer. The action was taken at a meeting in Philadelphia on Tuesday of this week in consequence of the Western manufacturers having failed to attend three conferences called for the purpose of effecting a settlement of the working prices of the operative potters of the country. The Eastern manufacturers are said to be willing to pay as high wages as those in the West, but as they have learned that

the English manufacturers have reduced their selling prices to meet the increased tariff duties imposed by the Dingley bill, they naturally feel reluctant to increase the cost of production at the present time. Negotiations have been entered into between the Trenton, N. J., potters and their workmen with the view of reaching a compromise and avoiding a strike.

Negotiations are still going on among the manufacturers of Sewer Pipe east of the Mississippi River looking to the formation of a combination and the establishment of a central selling agency. A meeting of the interests involved, which was held the week before last at Cleveland, Ohio, broke up without an agreement being reached, but it is reported that at a further meeting at Pittsburgh, Pa., on Monday last, the scheme was advanced so far that a final agreement is expected to be reached at the next meeting of the manufacturers, which will take place at Pittsburgh after the holidays.

H. Gilbert Hart of the Hart & Crouse Company, Utica, N. Y., was in New York this week visiting W. M. Mackay, 235 Water street, and W. M. Brownback, their Philadelphia representative, was also in the city.

Joseph E. Bond, president of the American Radiator Company, returned from Europe on last Saturday's steamer and was met by Clarence E. Woolley of the Chicago office and W. H. Hill, manager of the New York office.

Secretary Woods of the Fuller & Warren Company, Troy, N. Y., was a recent visitor among the heating trade in New York City.

Coyne & Delaney, manufacturers of Plumbers' Brass Goods and Specialties, are removing their establishment to 303 Rodney street, Brooklyn, N. Y., where they will have increased facilities for manufacturing their goods.

George P. Jacobs & Co. have moved their Steam Fitters' and Plumbers' Supply business to Broadway and Rodney street, Brooklyn, N. Y.

Wilson & Roarke, 261 Front street, New York, recently shipped one of their Sunbeam House Heating Steam Boilers to England. The specifications called for a boiler to be made of ⅜-inch sheet steel, as it was to carry a pressure of 30 pounds. The house make a specialty of Portable Vertical Tubular Boilers, and many of their Boilers in which the material is not so thick as mentioned are working under a pressure of over 100 pounds. The firm are now corresponding with a house in Italy with reference to the sale of some Steam Heating Boilers in that country.

Henry W. Avery, 367 Front street, New York, reports a good trade in the coppersmith business, having recently turned out some large Steam Jacketed Kettles, and also some Copper Stills. He makes a specialty of Copper Work for Ships and also does Ship Plumbing and Steam Fitting.

The Richmond Stove Company, Norwich, Conn., inform us that the popularity of the Richmond line of Heating Apparatus still continues, and from a list of contractors who are using these goods we find that C. B. Jackman & Son, Nashua, N. H., are using two No. 924 Richmond Furnaces in a large apartment house: John L. Congdon, East Greenwich, R. I., is using a Richmond Hot Water Boiler in the residence of Mrs. Edward Taylor, and J. Callaghan & Son, Cleveland, Ohio, are using a Richmond Hot Air Furnace in the residence of J. E. Gillin. The list covers a wide territory and includes Steam Heaters, Hot Water Boilers and Hot Air Furnaces.

The Metal Worker acknowledges the courtesy of an invitation to attend the eighth annual ball of the Enterprise Association of Steam Fitters, held in the Lexington Avenue Opera House on Wednesday, December 22. The invitation is signed by the secretary, J. F. Brown, and T. A. Simpson, the chairman of the Committee of Arrangements.

The Association of the Master Plumbers of the City of New York issue from their quarters, 155 East Fifty-eighth street, a notice that their ninth annual entertainment and reception will be held at the Central Opera House, Sixty-seventh street and Third avenue, on Thursday, January 13, 1898. Tickets can be procured from A. H. Brown, 1777 Broadway. The committee having the entertainment in charge is composed of T. J. Tuomey, chairman; J. W. O'Brien, J W. Cooney, T. J. McCormack, B. F. Donahue, T. F. Gaynor, A. H. Brown and H. J. Pattison.

We have received from A. Weiskittel & Son, proprietors of the Maryland Foundry Company, Baltimore, Md., a price-list of their Porcelain Enameled Bathtubs, printed in two colors. On the other side of the price-list a picture of a modern narrow roll rim Bathtub is shown on a marble slab, with tile flooring and side walls. The house have been making Cast Iron Bathtubs for some time, and are now furnishing what they claim to be the finest grade of Porcelain Enameled Baths.

Edward A. Hoops of Moylan, Pa., is installing a Gurney Hot Water Heating System in the residence of Mrs. Susan Sharpless.

Joseph Ahearn of San Francisco, Cal., is doing the plumbing in the Sacred Heart Convent, at Menlo Park, Cal.

The State Executive Committee of Master Plumbers of New Jersey met in Paterson on December 17 to receive the six master plumbers who are Assemblymen-elect from Essex and Hudson counties, with a view to discussing the proposed plumbing law and to take measures for its enactment.

President Culloton of the National Association of Master Plumbers announces from the headquarters, the Revere House, Chicago, the appointment of James E. Phillips, 1421 East Main street, Richmond, Va., as State vice-president for Virginia, and of P. S. Cook, Cheyenne, Wyo., as State vice-president for Wyoming.

The wedding of W. E. Crosby, the popular and efficient clerk of the National Association of Master Plumbers, and Miss Mary C. Johnson of Detroit is announced for December 28. We join with the many friends of Mr. Crosby in congratulating him and wishing him all happiness.

George W. Stewart is about erecting for S. Faith & Co., plumbers and heating contractors of Philadelphia, Pa., a three-story and basement building in the Italian renaissance style of architecture, having dark mottled brick facing with terra cotta and stone trimmings, large plate glass windows, &c. The frontage on Pennsylvania avenue will be 78 feet and on Taylor street 42 feet. The basement will be used for Pipe Work and the storage of Fittings, &c.; the first floor for offices, drafting rooms, showrooms, &c., and the second and third floors for Sheet Metal Work. The work will be commenced at once and is expected to be finished in about three months.

The Lunkenheimer Company, Cincinnati, New York and London, England, have been making preparations for a large shipment of valves and machine fittings to South Africa that will aggregate 26,000 pounds. This is a large shipment of this class of goods, and will be sent forward in a week or so. A consignment has just been made of 4000 pounds of brass fittings to Sweden by the company. The concern have been running full time, 56 hours a week, with 250 men, right along, which is up to the best of the past five years. Considering the improvement in the machinery that is used, by which no increase in the force is made necessary, this is better than has been done in years.

Pardee Hall, the fine four-story stone building presented to the scientific department of Lafayette College, Easton, Pa., by the late Ario Pardee, at a cost of $300,000, was almost entirely destroyed by fire on the morning of December 18. The center of the structure and the entire west wing were gutted and much valuable machinery, together with mineral and natural history specimens of great value, were consumed. The museum and the departments of mining and mechanical engineering and of geology were in the portions of the building wiped out by the flames. Among the sufferers by the fire was J. Madison Porter, professor of civil engineering, who lost all his machinery, instruments, papers, &c., valued at $15,000 and uninsured. The fine Ward Library, containing 10,000 volumes, was also destroyed. The total loss is placed at over $100,000. This is the second serious fire that has visited Pardee Hall since its opening in 1873. The first occurred in 1879 and practically destroyed the whole structure, which was immediately rebuilt and was reopened in 1880.

Official statements of the production of anthracite coal in November, 1897, show an output of 4,538,400 tons, as compared with 4,435,700 tons in November, 1896, and 5,012,700 tons in November, 1895. The total production for 11 months of the current year is about 37,900,000 tons, or nearly 2,000,000 tons less than in the corresponding period of 1896.

A profit sharing plan on a large scale has been inaugurated this week by the largest department store in Boston. The firm, under the new scheme, allow their employees 1 per cent. of their individual sales, in addition to their regular salaries. By this means they expect to give them an additional incentive to make sales and to work in the interests of the firm.

A dispatch from the City of Mexico announces the sale of the Inguaran copper mines of Mexico to Rothschild & Mirrabeaud of Paris, for several millions of dollars. Rothschild & Mirrabeaud, it is reported, will build two lines of railroad, one to connect with the western branch of the Mexican National Railway and the other with the west coast, so as to have connection with the Pacific Ocean.

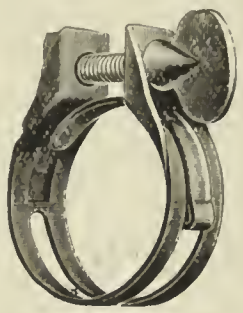
THE RETAIL STORE.

Protective Stove Dealers' Association.

The retail stove dealers of St. Louis, Mo., recently formed an association the object of which is to combat the growing competition of the large department stores. It is said that there are 150 retail dealers in the city, and that while more than 60 have already been enrolled the others are expected to join within a very short time. The organization is known as the Master Protective Stove Dealers' Association, of which G. A. Pauley is president, M. Kosch secretary and H. Kratz treasurer. A member of the association in speaking of the matter is reported to have said: "We intend to fight the department stores to a finish. The inroads that they have made in our business would astonish you. I know of several stove dealers who have been practically forced out of business on account of the department store competition. They can afford to undersell us, as they retail goods at low prices merely as an advertisement to their other business. We shall demand of the wholesale dealers as soon as our organization is sufficiently strong that they discontinue the sale of stoves to any dry goods establishment."

A Detachable Hose Clamp.

The H. B. Sherman Mfg. Company, Battle Creek, Mich., have recently added to their line of hose fixtures a brass clamp with a brass thumb screw and nut, as shown herewith. A clamp of this nature is especially desirable for use on connections to beer pumps, &c., where the connections may require frequent changing. If wire is used the tubing cannot be changed from its connection without considerable trouble, and the wire also cuts into the tubing, and not only weakens the tube but frequently causes leaks. This clamp, it is pointed out, can be tightened up in case there should be leakage. No tools are required either in applying or removing from the hose or tube, and there is nothing to rust, as all parts are of brass. It is



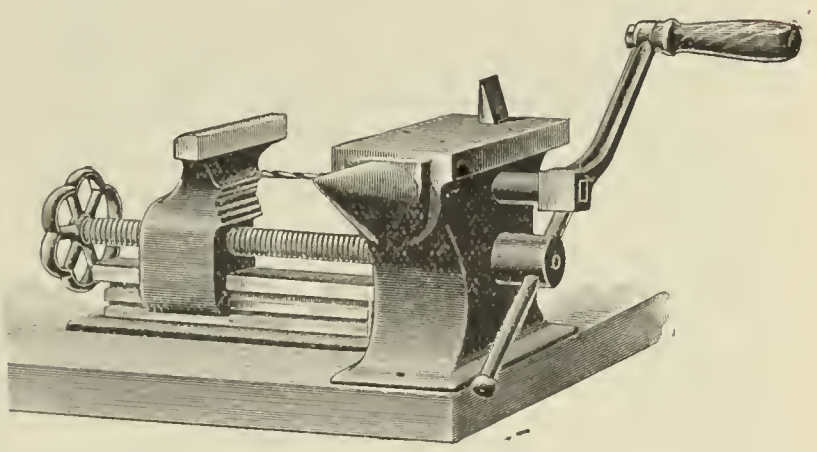
A Detachable Hose Clamp.

furnished in the ⅜-inch size, three different sizes for ½-inch tube and three different sizes for ¾-inch tube. The manufacturers will send sample of any size on receipt of 6 cents in postage.

Manager B. C. Bakewell of the metal department of Reymond & Gottlob, who are agents in New York for the Pittsburgh Reduction Company, reports an excellent local demand for aluminum. New fields for the metal are opening out constantly, and he finds the demand increasing in many quarters in which aluminum has been used more or less as a substitute for brass or other metals. The recent radical reduction in the price of sheet aluminum seems to have stimulated its use to a marked extent. This is particularly the case in the manufacture of signs, for which a steadily growing demand has been experienced of late. Mr. Bakewell is located in the same offices formerly occupied by the Pittsburgh Reduction Company, at 10 and 11 Havemeyer Building, New York City, of which Reymond & Gottlob took possession on November 1. The firm carry a very large stock of Aluminum in all its forms, such as Ingot, Sheet, Plate, Bars, Rods, Wire, &c., and are prepared to fill orders for the metal to any amount at regular factory prices. Reymond & Gottlob also carry a large line of Aluminum Household Utensils and Novelties at their down town store, as well as at their headquarters, 831 Broadway.

The Gipsy Combination Anvil, Vise and Drilling Machine.

The accompanying engraving shows a combination anvil, vise and drilling machine, which the Bonney Vise & Tool Works, 3015 Chestnut street, Philadelphia, are



The Gipsy Combination Anvil, Vise and Drilling Machine.

putting on the market. The tool is constructed of cast iron, with a steel vise screw, and is intended principally for the use of farmers. The anvil is 7 inches high, 12 inches long, with a 4 inch face. The vise jaw is 5½ inches wide and opens out 8 inches. Beneath the vise jaw and anvil faces are other gripping faces for holding pipe. The drill spindle is made for square shank drills, and may be slipped out of its bearings and put aside when the tool is not required for drilling purposes. When the tool is used as a drilling machine the vise handle bar is easily removed. The makers state that the tool weighs 40 pounds and is made for long service.

MEMORANDA.

The Haish Mfg. Company, De Kalb, Ill., publish an oblong circular illustrating many varieties of their Woven Wire Fences. Reference is also made to barb wire and descriptions of the various lines of Fences are given.

The catalogue and price list of the Never Break wares, manufactured by the Avery Stamping Company, Cleveland, Ohio, is being distributed to the trade. It is a small oblong publication of 50 pages, presenting a very handsome assortment of this well-known line of Wrought Steel Cooking Utensils. Illustrations are presented of the various goods, together with tables of sizes and capacities, and in many cases brief particulars are given of the merits of the wares. There are also many other articles noticed in the catalogue, including Snow Shovels, Fence Posts, Cattle Troughs, &c.

An extensive assortment of Nickel Plated Tea and Range Kettles, Coffee Pots, &c., are illustrated and described in a series of circulars distributed by the Rome Mfg. Company, Rome, N. Y.

The new building of the Canfield Stove Company, located on Spring street, Kingston, N. Y., is described in a recent issue of the Kingston *Daily Express* as being a structure 40 x 90 feet in size and two stories and basement in hight. The sides of the structure are covered with sheet steel stamped to imitate brick work, while the cornice and front are of galvanized iron, thus giving the appearance of a brick building with blue stone trimmings. Inside it is so arranged that a team can be driven the whole length on one side and heavy goods transferred to the basement and first floor, the floor being level with the top of the truck. A freight elevator is used to convey goods to the second floor. Everything is arranged with the idea of making it as convenient as possible and facilitating the handling of goods. The stock is arranged with a great deal of care and the Stoves, Ranges, Furnaces, Steam Heaters, Radiators, Plumbers' Supplies and other goods are so disposed as to fully meet the requirements of a successful wholesale and retail Stove, Plumbing, Heating and Sheet Metal business.

TIN PLATES.

New Castle, Pa., Tin Plate Works Not to Combine.

The projected consolidation of tin plate manufacturing interests at New Castle, Pa., is not to be carried out after all, so far as one of the largest concerns mentioned as a party to the deal are concerned. We are officially advised by the New Castle Steel & Tin Plate Company that the statement that they are to be consolidated with the new Shenango Tin Plate Company of New Castle is incorrect. Their works, we are informed, will continue in independent operation under the same management as heretofore, and they will manufacture the same well-known brands of the New Castle Steel & Tin Plate Company which have been on the market for the past four years. The news will be reassuring to many in the tin plate trade who have regarded the prospect of such a great consolidation as was contemplated with considerable apprehension.

American Base Box.

Following up their suggestion made earlier in the year for the adoption of an American system of Tin Plate classification and boxing to supersede the English method hitherto used, the American Tin Plate Company have sent out to all Tin Plate manufacturers, jobbers and large consumers the following circular letter from their sales office in Chicago, under date of December 20, 1897 :

"On and after January 1, 1898, all quotations made by us on Tin Plate will be based on the American base box and American package. Under separate cover we send you, with our compliments, a copy of the American Ratio and Code Book. You will find that the American base box and packages are arranged on the decimal system, making it much easier to compute prices, weights and quantities than on the English system. You will also find a great conveinence in the American system in describing all gauges by the base weight, doing away entirely with IC, ICL, IXL, IX, DX, &c., No. 38 Gauge, No. 37 Gauge, &c. We ask your kind support in adopting this system.

"A copy of the American Ratio and Code Book has been mailed to all Tin Plate manufacturers, jobbers and consumers, so that the code can be used generally."

We are advised that the company have been led to take this step after personal interviews with the largest class of buyers and consumers of the country, whom they found in favor of the proposed change and whose support they are promised in carrying out the plan. A number of the largest dealers, too, have said that they will put the new system into effect, provided the company get up a ratio book. This has been done and the system is now to be definitely initiated.

In line with the new departure, the American Tin Plate Company have issued a new quotation sheet (E), in which the base price of their Plates is based on 32,000 square inches and 110 sheets to the box. The standard base weights given are 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 110, 120, 130, 140, 160, 180, 200, 220, 240, 260 and 280 pounds to the box and the price of each description is arranged in a fixed ratio to the base price. Provision is made for wasters, extras, &c., on a stated basis. The American base box as established by the company is described as containing exactly 2 per cent. more square inches than the English base box, IC, 14 x 20, 108 sheets.

The November shipments of Tin and Terne Plates from Great Britain to the United States amounted, according to the British Board of Trade returns, to 5570 tons, an increase of 500 tons over the October figures, and a decrease of 300 tons as compared with November, 1896. For the 11 months ended November 30, 1897, the Tin Plate exports from British ports to this country reached a total of 75,352 tons, as compared with 105,972 tons in the corresponding period of last year.

SCRAP.

The Tin Plate and Can works of Norton Brothers, at Maywood, Ill., are among the largest of their kind in the world. The Tin Plate department, which contains 18 tinning sets, has a capacity of 10,000 boxes, 14 x 20, a week, and the Can making factory is capable of turning out 550,000 Cans a day. The Tin Plate manufacturing building is 264 x 106 feet, the Fruit Can factory 240 x 110 feet, the general factory 250 x 275 feet and the rolling mill and foundry 300 x 40 feet. There is also a warehouse, 200 x 125 feet, capable of storing no less than 15,000,000 Cans. The buildings are connected with one another and with the railroad by a mile of pivate side tracks.

Jacob Graff, manager and principal owner of the Blairsville Rolling Mill & Tin Plate Works, Blairsville, Pa., died suddenly on December 15, at Blairsville, from a stroke of apoplexy. He was 60 years of age and was identified with many business interests of the town. He is survived by a widow and one child.

The Pennsylvania Tin Plate Company, New Kensington, Pa., expect to have their additional capacity of two hot mills and two new stands of cold rolls, together with new tinning machinery, in operation about January 1. This will give the company a six-mill plant.

The changes in the plant of the Monongahela Tin Plate Company, Pittsburgh, Pa., will include, besides an increase of five new mills, a complete remodeling of the hot mill department and the rearranging of the cold rolling department to the tandem system.

The Reading Tin Plate Works, Reading, Pa., are kept busy on orders for early delivery. They are turning out about 400 boxes of finished Plates a week.

Activity is the order of the day with the American Tin Plate Company, who are operating 26 mills and 51 tinning sets at their works at Elwood and Montpelier, Ind. Every department of both plants is reported to be constantly busy.

E. H. Stroud & Co., 511 Northern Office Building, Chicago, metal factors, have recently opened an office for the convenience of their Eastern customers at Room 502, Woodbridge Building, 100 William street, New York. Stroud & Co. sell the entire product of certain manufacturers of Iron and Steel in the Pittsburgh district, and also represent several Ohio mills manufacturing Sheet Iron, Black Plate, Tin Plate, &c. They also do a large business in Brass and manufactured Copper, and in pig metals, such as Spelter, Lead, Ingot Copper, &c. With the exception of manufactured Brass and Copper they do not sell less than a carload lot.

The existing depression in the Welsh Tin Plate industry was emphasized at a recent public sale of shares of the Park Tin Plate Company of Clydach. The bidding was slow and the price eventually realized was $650 for each $1250 fully paid up share, a depreciation of 48 per cent.

We are in receipt of a neat folder, printed in red and brown, just issued by the Phillips Tin Plate Company, Incorporated, 1019 Susquehanna avenue, Philadelphia, which calls attention to their well-known brands of Tin and Terne Plate. These include three brands of Bright Charcoal, one brand of Coke and seven of Roofing Tin. Attention is also called to the company's high grade Terne Plate, put up in rolls, ready locked, soldered and painted for laying on the roof. The firm advise us that they have a good established trade and are experiencing a very gratifying demand for their product, many of their customers dating back since 1892.

A recent report of the Commissioner of Lands and Mines of Perak, a State on the Malay Peninsula, under British control, places the output of Pig Tin from that district in 1896 at 22,754 tons, which is less by 1052 tons than the corresponding figures for 1895. The production last year was diminished by the lower price of the metal and by unusually heavy rains. The value of the ore ex-

ported in 1896 was $12,339,877, being $1,713,630 less than the value of the 1895 exports. The territory devoted to Tin mining in Perak at the close of 1896 was 67,553 acres. The report notes that a fall of 15 per cent. in the price of Tin in two years has been accompanied by a fall in production of 3 per cent. only.

The six new Black Plate mills of the La Belle Iron Works, Wheeling, W. Va., are nearly completed and will be started up soon after January 1. This addition will increase the Tin Plate capacity of the concern to a ten-mill plant. Six new tinning sets have also been added, making 14 in all.

The new Tin Plate plant of the Cincinnati Rolling Mill & Tin Plate Company, Cincinnati, Ohio, at Riverside, is reported in active operation with three Black Plate mills and five tinning sets. A fourth Tin mill is building.

After running successfully for some five years, Gummey, McFarland & Co., Philadelphia, have closed down their Continental Tin Plate Works for good and disposed of the tinning machinery, &c. The firm do not propose to coat any more plates, having made satisfactory arrangements with a large mill to manufacture for them their well-known special brands of Tin and Terne Plates.

The six-mill plant of the Beaver Tin Plate Company, Lisbon, Ohio, is running full in all departments. The concern are making a new brand of Terne Plate, which they designate Beaver Extra.

The Baltimore Tin Plate Company, Locust Point, Baltimore, Md., are operating two out of their four hot mills and three tinning sets, and are turning out Bright Charcoal and Coke Plates and Terne Plates, all under the brand name of Baltimore.

John L. Nash of the well-known Tin Plate firm of Henry Nash & Co., Liverpool, England, arrived in New York on Wednesday by the steamer "Majestic," on a short business trip. Mr. Nash is spending the holidays with his brother, H. V. B. Nash of T. B. Coddington & Co., New York.

A Novel Mountain Railway.

A mountain railway, constructed on a novel plan, is shortly to be opened for traffic on the Hochstauffen, near Bad Reichenhall, Bavaria. The chief feature of the new system, says the London *Times*, is that the force of traction is directed vertically upward, being derived from a balloon. The latter has a diameter of 66 feet and a lifting power of 10,560 pounds. The balloon, car, net, ropes, &c., weigh 4620 pounds, and an allowance of 3300 pounds is made for passengers and aeronauts, leaving a margin of 2640 pounds. A single rail is used for the sole purpose of directing the course of the train and keeping the balloon with its load captive. To this end the rail is made T-shaped, and the car runs on it, gripping it from the sides and from below. The rail is anchored to the ground at distances of about 15 feet. In descending the mountain the propelling force is gravity, and the balloon acts as a check to prevent accelerated motion. A ballast of water, taken in at the top of the mountain, provides the additional downward force required. The truck carries the water receptacle, which can be opened by the aeronauts during the journey. The truck and receptacle together weigh about 600 pounds, and when there is no wind the receptacle carries about 1100 pounds of water, making a total weight of 1760 pounds. When it is windy the strain between the balloon and the truck is reduced by letting the water out of the receptacle, thus compensating for the difference in power. The difference in weight caused by passengers entering or leaving the car is regulated by the use of separate weights, a sufficient number of which will be kept at the several stations.

TRADE NOTES.

Columbia Nickeling & Enameling Works have been incorporated in New York City, with a capital stock of $3000. The directors are James D. Wicks, Harry F. Lawrence and James P. Stephens of Brooklyn and Harry I. Andrews of Housatonic, Mass.

The James Hill Mfg. Company, Providence, R. I., issue illustrated cards calling attention to their new Vulcanized Fiber Roving Can, specially made for them by the Vulcanized Fiber Company of Wilmington, Del. The bottom of the can is made of XXX tin plate, of conical form, with star corrugations. The cans are coated inside and out with a water proof coating that prevents them absorbing moisture and gives them a handsome appearance. They are made in seven different diameters from 9 to 18 inches and 36 inches or less in hight.

The Board Printing Machines made by the Dover Machine Works, Dover, Del., are illustrated and described in a catalogue issued by that firm. The catalogue also presents a number of testimonial letters in *fac-simile* from box makers and others who have used these machines.

An illustrated catalogue issued by Heebner & Sons, Landsdale, Pa, calls attention to their Agricultural Machinery, which is illustrated and described.

We are indebted to the Magnolia Metal Company, 266-267 West street, New York City, for an attractive card calendar for the coming year. The back is celluloid, handsomely printed with an advertisement of the company, giving special emphasis to Magnolia Metal of their manufacture. The cards, 12 in number, are printed in blue and red and slipped in a pocket at the lower end.

American Exposition in China.

Shanghai, China, is to have a permanent exposition of American manufactures and machinery. George S. Bowen, organizer of the association which built the old exposition building on the Chicago lake front, is president of the company who are to carry the gospel of machinery into the Flowery Kingdom. The active manager is Col. M. R. Jefferds, projector of China's first interior railway. Congress may take up the matter at this session, and Senator Jones of Nevada has promised to introduce a bill appropriating the $200,000 which the exposition building will cost.

Mr. Bowen and his associates have agreed to call the immense exchange the American-Chinese Chamber of Commerce. They have already leased ground in Shanghai for the building. W. W. Boyington of Chicago is architect. It is to be 400 feet long and half as broad, with a central dome 100 feet high. The interior will be cut up into aisles and booths in the way familiar to all exhibition goers, and the American manufacturers who want to show their wares to the Chinese will have to pay a nominal rent for the privilege.

The McCormick Harvesting Machine Company are the largest concern to apply for space as yet, with Furst & Bradley, the pioneer plow men, and the Deere Company, makers of agricultural implements, tied for second place. The manufacturers of agricultural machinery, reapers, threshers, plows and wagons will, it is said, command practically an unlimited market, which even the English have made no attempt to corner, and the makers of mining machinery will have immense ore deposits to work their crushers and separators on.

W. R. Townsend of San Francisco, who is now in Tokyo, Japan, on a somewhat similar expedition for San Francisco merchants, will be the resident manager of the scheme, although the main office of the concern will be at 56 Fifth avenue, Chicago. The plans of the building include rooms for the American Consulate at Shanghai and quarters for an American bank.

President Bowen says: "China is the greatest of fields for the expansion of American manufacturing interests. The Chinese farming and mining machinery is of the crudest type, and it would need only the introduction of our implements to make the field our own. You can't teach a Chinaman by means of pictures, but if you show him the machine itself and make it clear to him that it does his work better than the antediluvian implements he has been using for 20 centuries, you impress him and capture him at once. That is what we intend doing—to give American manufacturers, Chicago firms especially, the opportunity to show their goods to Shanghai and the rest of China, and I'm sure that our exchange cannot miss success."

In order to make a final settlement of the trouble which has been going on for a long time between the Nebraska cattlemen and the Indians of the Pine Ridge reservation, over the question of stray cattle on the reserve, Major Clapp, the Indian agent at that place, has decided to build a five wire fence the length of the reservation—namely, 60 miles. It is to be put up in the spring.

At the annual convention of the American Federation of Labor, held last week, at Nashville, Tenn., Samuel Gompers was re elected as president. Kansas City was chosen for the next meeting place. The convention approved the Lodge bill for the restriction of immigration, and decided to appeal to the unions for contributions to aid the striking engineers in England.

The Mercantile Rubber Manufacturers' Association met last week in New York City and discussed the recent advance of 10 per cent. in the price of goods manufactured by the members of the association. It was decided at the meeting that another advance of 5 or 10 per cent. will be necessary, on account of the continued high price of crude rubber. The advance will probably be made on January 1.

STOVE TRADE NOTES.

WESTERN FURNACE ASSOCIATION.

The Western Furnace Manufacturers' Association held a meeting in Chicago on the 21st inst. The attendance was quite small, but it was nevertheless an interesting session of the association. F. T. Giblin of Utica, N. Y., a member of the Eastern Association, was present and gave some practical remarks on the need of just such work as the association proposed to do and the disposition of Eastern manufacturers to co-operate. The officers of the Western organization have not made as good headway as they would wish in working up the manufacturers to a proper spirit of co operation. Some are evidently fearful that the association will in some way operate to their disadvantage and prefer to continue the old practices of long credits, consignment of goods, &c., which have brought the Western furnace business to such a low ebb. The Eastern manufacturers are working in such harmony, however, that the Western men have not given up hope of being able to accomplish something, and missionary work will be carried on for some time further and more vigorously than ever. Another meeting will be called in the near future to endeavor to get matters in shape for the coming season.

TRAVELING STOVE SALESMEN FOR 1898.

The Michigan Stove Company, Detroit, Mich., will be represented on the road during the ensuing year by the following salesmen, who will cover the territory indicated: L. B. Young will travel in Northern Michigan, A. H. Dane in Southern Michigan, Louis Hayward the city of Detroit, James W. Weldon in Ohio, George G. Garey in Indiana, Fred. E. Goodman in New York and Pennsylvania, Harry S. Goodman in Kentucky, Tennessee and the Virginias; William D. Maunger in Georgia, Alabama, Mississippi, Louisiana and Arkansas and John G. Taylor in sections of Indiana and Ohio.

The Buckwalter Stove Company, Royersford, Pa., have made arrangements to have their interests looked after by the following salesmen: Ed. Q. Smith in Northern New Jersey, Eastern New York and New York City; George H. Mahood in New England and Southeastern Pennsylvania; Harry W. Kern in Central and Eastern Pennsylvania and Western New York and E. V. Coulston in Western Pennsylvania, Ohio and West Virginia.

The Cleveland Co-operative Stove Company, Cleveland, Ohio, will be represented by O. W. Zehring in Northwestern Ohio and Eastern Indiana, H. J. Topky in Northeastern and Central Ohio, A. J. Walp in New York, Pennsylvania and West Virginia and J. W. Cooley in Michigan.

Schwab & Sercomb, Milwaukee, Wis., will have their interests looked after by Nelson C. Parker in Illinois, Iowa and Northern Missouri and Kansas; J. M. McHenry in Wisconsin, Minnesota and Northern Michigan and A. O. Jones in Michigan, Ohio and Indiana.

The Plymouth Stove Foundry Company, Plymouth, Mass., will be represented by Warren T. Simpson in Southeastern and Western Massachusetts, Rhode Island and New York; W. H Dempsey in Northern Massachusetts, Maine, New Hampshire, Northern New York and Vermont.

The Home Stove Company, Indianapolis, Ind., have arranged with the following salesmen to look after their interests: F. T. Meharry in Northern Indiana and Southern Michigan, R. A. Henry in Southern Indiana and Northern Kentucky, L. A. McCammon in Iowa, Charles L. Vining in Missouri, J. W. Roraback in Wisconsin, C. F. Mills in Illinois and John Haskett in Ohio.

The Excelsior Stove & Repair Mfg. Company, Quincy, Ill., will be represented by C. H. Gunn in Iowa and Nebraska, Theodore Ehrhart in Southwestern Missouri and Kansas, W. J. Fisher in Northern Missouri, H. F. Figgen in Illinois, and Anton Ohnemus, secretary of the company, will call on the jobbing trade.

Toledo Stove Company, Toledo, Ohio, will be represented by Henry Werdehoff, who will travel in Ohio, Indiana and the eastern part of Michigan during 1898.

Graff & Co. of Pittsburgh, Pa, have arranged with F. F. Jeffreys, William Hineman and William Eccles to look after their interests on the road during the year 1898.

The Ringen Stove Company of St. Louis, Mo., will be represented on the road by W. S. Ley, who will travel in a part of Indiana, Ohio and Michigan, Kentucky and West Virginia; W. A. Lockwood in Kansas, Colorado, Indian Territory and Oklahoma; A. X. Smith in Iowa; Louis A. Buck in part of Minnesota and Missouri, Wisconsin and New York; H P. Gingrich in Illinois, Tennessee and South; E. L McBride in part of Minnesota, North and South Dakota and Nebraska; R. S. Buck in northern California, and John A. Preston in Florida.

The Favorite Stove & Range Company of Piqua, Ohio, will have their interests looked after by W. H. Pier in Wisconsin; W. L. Miller in Iowa and northern Illinois; C. Winkelmann in central and southern Illinois; J. C. Frame in northern half of Indiana and part of southern Michigan; J. E. Schroyer in southern half of Indiana; Thomas B. Clemons in northern half of Ohio; Cloyd Smith, in southern half of Ohio, and J. C. Taylor, J. S. Cadot and George A. Simpson in Michigan. The trade in Minnesota, the Dakotas and the far West will be looked after by the St. Paul branch, while the Kansas City branch will take care of the trade in that vicinity.

The S. M. Howes Company of Boston, Mass., will be represented by J. H. Brown, who will visit dealers in the cities of Massachusetts and Vermont; A. J. Marlatt, who will cover the State of Connecticut and a portion of Massachusetts; R. B. Curtis, who will look after the company's interests in southern Massachusetts and Rhode Island, and F. B. Neefus, in Maine and New Hampshire.

The Bloomington Stove Company of Bloomington, Ill., will be represented by M. U. Hagaman in the territory east of Illinois and Indiana; J. B. Wilson west of Illinois and east of Iowa, and Taylor Henderson in the rest of Iowa.

ODD PLATES.

P. F. & A. T. Jones of Nashville, Tenn., have been appointed Southern agents for the Schill New Idea Furnace, made by Schill Brothers of Crestline, Ohio. This Furnace, we understand, was awarded a gold medal at the Tennessee Centennial Exposition recently held at Nashville.

Carey A. Moore of the Charles C. Heath Company, 4 North Liberty street, Baltimore, Md., was one of the visitors at *The Metal Worker* office last week. Mr. Moore reports a steadily increasing trade for their National Hot Air Furnace in sections where a high grade Furnace is desired. He also reports a gratifying season for their Empire State Heating Stove, which is of the tamale type of the best grade, it being provided with a cast iron bottom and top and an ash pit, and arranged for burning either coal or wood. The Stove is oval in form, and the steel body is corrugated in order to improve its appearance. The Stove is likewise made with a cast iron front, which is corrugated in design to correspond with the steel

body. When used for coal the Stove has a cast iron lining. It is provided with a nickel plated top cover, so arranged that the nickel is said to remain untarnished. Another of their leaders is the Grand Range, which is provided with a snug hearth and a very handsome and extra deep base. It is furnished with either a duplex or flat grade, and made in two sizes with 10 and 20 inch ovens. It has nickel plated top bands and a handsome nickel plated name plate for the oven door, and can be supplied with all the usual extension shelves and top shelves, and also water back or reservoir, as desired. One of the most attractive features of the Range is said to be the price at which it is quoted by the house. A Stove for which they have had a fine demand this fall is their Park Square Stove of the self feeding type of a very pleasing design, and which seems to have been a successful leader with many of their customers.

Arrangements are being made to heat Grant's Tomb in this city with Gas Radiators, in order to prevent the sweating of the massive masonry, and also for the comfort of the visitors and attendants.

The French Consul at Smyrna, Turkey-in-Asia, in a recent report to his Government, says: "Petroleum Stoves for heating rooms would be likely to do a big trade. The first were sent here from Germany, and immediately realized a large sale. They cost from 25 to 50 francs, according to size, and only burn very little petroleum. As gas is dear here, whereas petroleum is cheap, it is certain that the use of petroleum Stoves will be general in a very short time, and they will be imported in large quantities."

One of the attractions which John P. Ley, 239 Water street, the New York City manager for Charles Noble & Co., Philadelphia, is displaying in his showrooms is the new Quick Meal Wickless Blue Flame Oil Stove. This Stove has a pressure regulator so that the amount of oil in the tank does not have an effect on the hight of the flame. The lever which controls the size of the flame is provided with an attachment so that the flame can be adjusted to burn indefinitely at a desired hight. The Stove burns with a blue flame, and there is no cotton wick to become charred or need renewing.

William Jackson's Sons, 246 Front street, New York City, display such a handsome line of Grates, Mantel Fire Place Linings, Fire Dogs and Fire Place Trimmings, that one could readily form the idea that it was a Christmas display. These goods, however, are standard with the house. The use of onyx, silver plate and handsome tile contribute much to the beauty of their productions.

D. G. Cooper, Pequabuck, Conn., in a letter informs us that the trade in Oven Thermometers has increased during the past year and that their use is becoming more generally understood by the public, and the advantages of this device are recognized to the extent that Stoves provided with a Thermometer are sought by prospective buyers.

Benjamin Burton, for many years connected with the Ransom Stove Works of Albany, N. Y., died suddenly at his residence on Second street in that city on December 11. He was 72 years of age, and was one of the best known residents of Arbor Hill.

In a recent interview by a representative of a local paper Black & Germer of Erie, Pa., stated that the volume of their business last season was very much in excess of that of a year ago. They worked ten hours a day, gave employment to an enlarged force, and look forward to increased sales during the ensuing year.

The Gobeille Pattern Company of Cleveland, Ohio, are sending out a postal card on the back of which is a large red panel bearing in bold faced black letters the inscription: "We do not sell duplicates, nor make more than one set of patterns from a single original model." Above this in the center of the card is a *fac-simile* of their trade-mark, while at the bottom of the panel is the company's signature. Another postal card argues for new patterns by pointing out the absurdity of keeping up with the style in other matters and lagging behind in the style of Stove construction and decoration.

The Foster Stove Company of Ironton, Ohio, and Louisville, Ky., have issued a 20-page supplement to their catalogue, in which attention is directed to the new Stoves added to their already large assortment for the fall of 1897 and the spring of 1898. The company state that they aim to keep abreast of the times, and in their Foster Range, Foster Jewel, Foster Pride and Foster Air Tight they have a line possessing selling features which cannot fail to command the attention of the trade. The Foster Range is a richly decorated substantial six-hole construction with removable top and front oven plate, large reservoir and capacious oven. The Foster Air Tight Parlor Heater is of the down draft variety, the air being admitted from the top and carried down through a pipe which is in contact with the fire, thereby heating the air before it reaches the fuel. It is made in three sizes and is of attractive exterior. A Stove which is made for burning slack is constructed on the reservoir principle, and is known as the Foster Slack Burner. Directions for setting up and operating the Stove are given as well as sectional views indicating the internal construction.

A final decree by consent has been rendered in the United States Court for the District of Indiana in the suit brought by Bucks Stove & Range Company against the Southern Stove Works, concerning the use of white enamel lining for oven doors by the latter concern. The Bucks Stove & Range Company waive all claims for damages and the Southern Stove Works are restrained from any further use of white enamel on their Cook Stoves or Ranges in such a way as to enable them to be sold under the name White Enamel.

Among the first calendars for the new year which have reached us is the one sent out by the Fuller & Warren Co. of Troy, N. Y. In its general style and make-up it is similar to those which have been distributed by this concern for a number of years past. The basis of the calendar is a heavy card, measuring about 14 x 11 inches and carrying 13 leaves varied in color, representing the different months of the year, the last one being devoted to a counting house calendar, covering not only the 12 months of 1898 but the first six months of 1899. The printing is in a brown ink and at the bottom of each leaf in white outline letters is the name P. P. Stewart. The leaves measure about 11 x 8¼ inches, thus leaving a border on the cardboard. This has a bronze ground upon which in dark brown letters appear the name and address of the company, the year and the inscription "All Stoves, Furnaces and Ranges bearing the name Fuller & Warren Company are guaranteed of the best material and workmanship." The card is provided with a metal loop for hanging it up, and upon the back is a bird's eye view of the company's works, together with the names of some of the leading lines in the way of Cook Stoves, Ranges and Heaters which the company manufacture.

The W. L. Armiger Mfg. Company have recently been incorporated at Baltimore, Md., with a capital stock of $50.000, for the purpose of engaging in the manufacture of Stoves, &c. The incorporators are William L. Armiger, Waldo Newcomer, Charles G. Kriel, Daniel A. Klein and William A. Kammerer.

The Bloomington Stove Company of Bloomington, Ill., look for an improved business next year, and state that in order to hold their own they have gotten out an entirely new line of Cook Stoves and Ranges with square ovens in all styles and sizes. The smaller sizes they expect to have on the market by February 1. They are also getting out patterns for Hard Coal Base Burners, Oak Stoves and Air Tight Heaters. In fact, they are contemplating adding to their present goods new patterns all around. They are taking an inventory two weeks ahead of time in order to get their new goods on the market, and will resume active operations at their works the first week in January. We understand that they have a number of orders on hand for their new goods, these being for early delivery in February.

The Chicago Stove Works of Chicago, Ill, have brought out a new Steel Range, which they are offering under the name Gold Coin. It is referred to as being of moderate price, has asbestos lined walls, reversible duplex grate for wood and coal, front draft hinged, giving access to the fire box under the front linings, capacious reservoir and handsome nickel trimmings. This Range has just been brought out and the manufacturers intimate that dealers will want the entire line in 1898.

The Estate of P. D. Beckwith of Dowagiac, Mich., proprietors of the Round Oak Stove Works, have just completed the patterns for a steel Range which will be added next year to the Round Oak family. We understand that it will be manufactured as a specialty in connection with their cast Ranges.

The Detroit Manufacturers' Club held their annual dinner at the Hotel Cadillac, Detroit, Mich., on the evening of Friday, December 17, which was regarded as the most successful in the history of the organization. The speeches were of a high order and related to the importance of organization among manufacturers, just and humane treatment of employees and to the railroads and their bearing on the manufacturing industry of the city. The president of the club, George H. Barbour of the Michigan Stove Company, made some very interesting remarks congratulating the members of the club on their large representation, and afterward he read a short paper on "Home Support," in which he urged the necessity of patronizing home manufacturers and home retailers.

In planning out their business for next year the Henry E. Clark Company, Boston, Mass., have arranged for an excellent line of goods, including several lines of Refrigerators, also Blue and White Flame Oil Stoves, Gasoline Stoves, &c. They have likewise made arrangements for the sale of four lines of Bicycles, and are putting a special man on the road to work up this trade as a branch of

their other large jobbing business. As mentioned briefly in *The Metal Worker* last week, they have leased a large store at 56-58 Union street, running through to Friend street, which they will occupy early next season, and which will give them a first-class store with all the modern improvements.

The "Western Stewart" Patent Case.

The readers of *The Metal Worker* will recall the fact that, about a year since, the Circuit Court of the United States for the Southern District of Ohio rendered a decision against Herman Soehmer, a customer of the Fuller-Warren Company of Milwaukee, Wis., in a suit brought for the intringement of certain patents belonging to the Favorite Stove & Range Company of Piqua, Ohio. The Fuller-Warren Company defended their customer and appealed the case. On the 7th inst., in the Circuit Court of Appeals, Sixth Circuit, the decree of the court below was reversed and the cause was remanded with directions to the court below to dismiss the bill. The Fuller-Warren Company have issued a circular to the trade, setting forth the circumstances attending this suit and their final success, and reviewing in caustic language the position of their opponents. We take from this circular some extracts from the opinion handed down by the Court of Appeals, as follows :

"It is claimed for this patent that it provides more space for the flues and oven without increasing the cost of the stove. Whether this is so with respect to the flues seems to be upon the evidence dubious. The reasons advanced for believing it are not very satisfactory. If the oven is enlarged the curving in of the side plates at their edges must necessarily involve the use of more material than if the plates were vertical throughout. But it is not necessary for us to decide how the fact is with regard to the increase of the oven space by the proposed construction. It seems clear that if the bottom plate is contracted to diminish the material it must be at the expense of the flues. It is true that the bringing of the oven doors back upon the rear projection of the side plates might, from the size given to the doors, induce purchasers to believe that the oven is larger than it really is. But that would be a species of deception which could hardly be said to be an improvement in a useful art which the patent laws are designed to encourage."

In considering the status of the prior art in the construction of the flues, the court says:

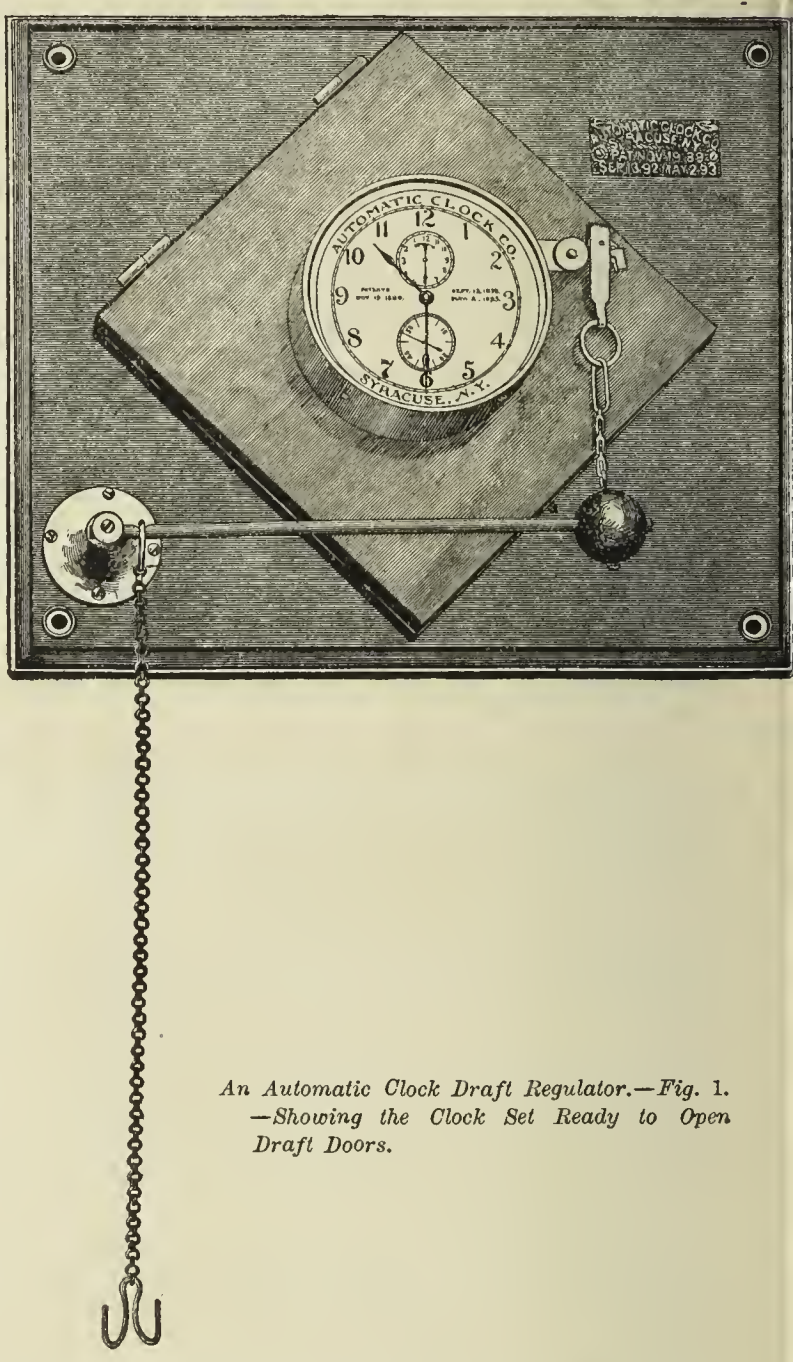
"It is shown by the evidence in the record that as early as 1877, and for several years thereafter, Gurdeon G. Wolfe of Troy, N. Y., made and sold a large number of stoves having a similar curvature and expansion of the side plate along the side of the flue extending under the bottom of the oven. This device of Wolfe, after some modifications, was patented to one Gobeille of Cleveland. In this patent the back flue, it is said, was extended by curving the wall of the flues adjoining the sides. This is testified to by the witness Keep, who was engaged in the stove business at Troy at the time, and he is corroborated by Wolfe himself, who was produced as a witness, and also by the witness Hagan, a mechanical expert and solicitor of patents, who examined one of Wolfe's stoves in 1879 while a suit was pending concerning the validity of a patent involved in its construction."

Again on this question of anticipation, the court further says:

"There is much evidence in the record in regard to the Garland stoves, which the appellee produces as anticipating the patent in suit. It was proven by the appellee clearly enough that the Garland stove, which also possesses the same circular formation near the edges of the side plates, was manufactured and on sale prior to the date of Boal's application for his original patent, and that Boal must have known this. But after this proof was in, the complainant offered evidence to show that Boal's invention was prior to his application and antedated the production of the Garland stove by a short period of time. It may be true. We do not decide that question. The circumstances are such that we should feel impelled to look into it more critically if we were not satisfied that Boal had been anticipated in another quarter. It seems altogether likely that both the Boal and Garland stoves are simply the adoption and expansion of old constructions."

The design patent related to a design employed in the form and ornamentation of the complainant's stove. The court says with respect to this :

"The form is stated to embody round corners on the front frame plate, the edges of which are flush with the edges of the curved door. The ornamentation consists of scroll work on the outside borders of the larger side members of the stove and upon the body of the smaller members, which lack room for the advantageous representation of such work upon their margins. . . . The first claim is the only one involved in the controversy. It is not urged that any of the others are infringed. The art of ornamentation with scroll work is ancient. The classical sculpture and architecture of the old civilization employed it in various styles and in a variety of their productions, and its use has been continued and enlarged not only in the old departments of the arts, but in new and familiar productions in domestic life. Not only the columns, capitals, walls and ceilings of buildings and tapestries, old and new, illustrate it, but the counterpanes of beds, the covers of tables, and the borders of the pages and covers of books and magazines are some of many other things seen in almost universal use."



An Automatic Clock Draft Regulator.—Fig. 1. *—Showing the Clock Set Ready to Open Draft Doors.*

In finally summing up its conclusions upon the design patent, the court said :

"To declare the defendant's stove an infringement, would be to concede to the Boal patent pretentions broad enough to cover the whole field of ornamenting stoves with scroll work, applied according to the generally approved style and methods of the art. As this concession must be denied, it follows that the alleged infringement must also be denied. The decree of the court below will be reversed, and the cause remanded with directions to the court below to dismiss the bill."

An Automatic Clock Draft Regulator.

To meet the complaint that a "heating job won't warm the place early in the morning," the heater draft regulating attachment of the automatic clock is manufactured by the Automatic Clock Company of Syracuse, N. Y. It holds the fire in check at night, and opens one or all drafts at a set time in the morning, thus assuring a comfortable temperature at any hour. Fig. 1 shows automatic clock with its rod and attachment for heater chains. The clock, with its sliding bar drawn out toward the track, forms an obstruction which detains a traveler on an inclined track. This traveler is attached to one end

of a brass drop lever, the other end being held firm in a swinging shoulder. The chain or heater attachment is slid along the rod, close to the shoulder, and is now ready to receive the chain or chains which run to the heater. There is no alteration to be made in the chains for a hot water or steam heater, the chain which runs from the long arm of the lever when hung on the heater attachment holding the fire in check. A slight alteration for a hot air furnace is made by arranging a counterweight sufficient to open the draft, as shown in Fig. 2. A chain from this counterweight and the chain from back draft when hung on the heater attachment shuts off all drafts.

It is supposed the clock has been wound up and set for the time desired for turning on the drafts in the morning.

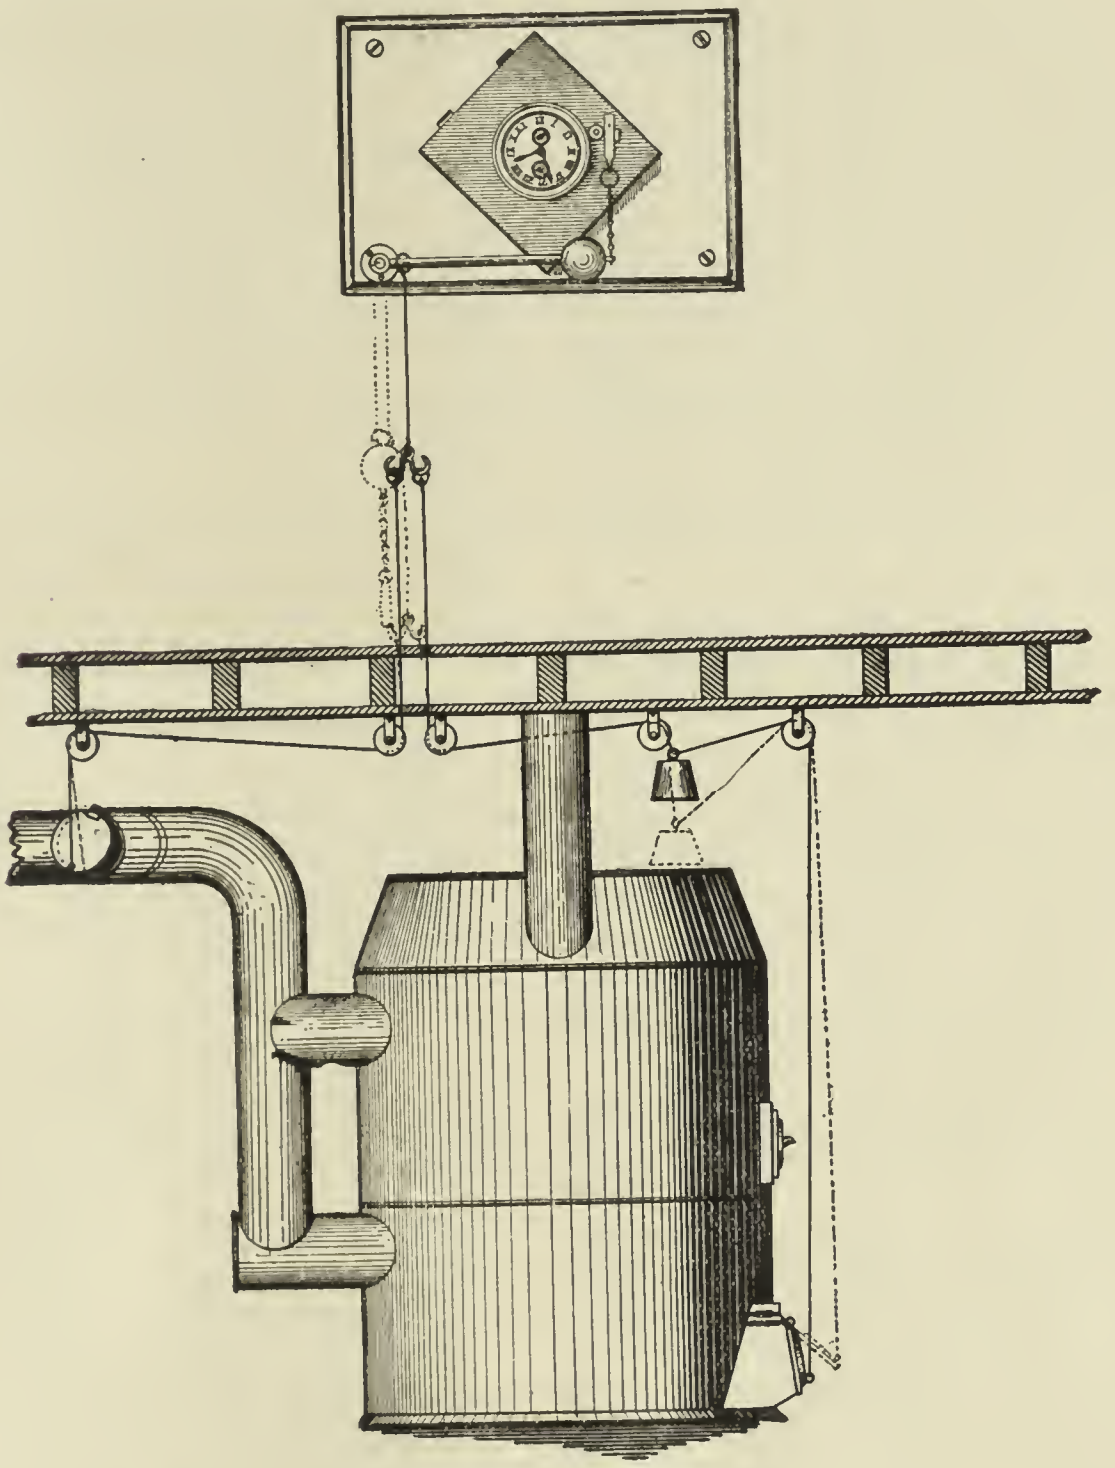


Fig. 2.—Showing the Device Arranged to Open the Drafts of a Furnace.

The fire has been fixed for the night, and the consumption of fuel has been limited or stopped. At the set time in the morning the bar slides into the clock. The obstruction being removed, the traveler rolls off its inclined track, the rod drops the heater chains and all drafts are on. The consumption of fuel begins at once, and by the time the heat is needed the building is thoroughly warmed. This automatic device does not interfere with the independent working of the regular chains by hand during the daytime. The device is strong enough to operate any combination of heater drafts such as may be found in churches, schools, public buildings, &c.

W. H. Colebrook & Co., Syracuse, N. Y., manufacturers of Stove Polish, Asbestos Cements, Paper Mill Board, Plumbago and other specialties, are recalling themselves pleasantly to their customers with a Christmas card bearing a spray of evergreen, the universal emblem of the season of good will.

We are advised by Charles Josselyn, general manager of the Great Western Can & Machine Company of San Francisco, Cal., that the company have purchased the tin can manufacturing plant of the San José Fruit Packing Company, San José, Cal., and will locate their works at that point. The Jensen and Wheaton machines which were used by the San José Fruit Packing Company will be replaced by special cau making machines recently invented by Axel Johnson and owned by the Great Western Company. The new plant will, it is expected, be in operation by May 1. It will have a capacity of 4,000,000 cans a month. The advantages offered by San José as a location for this industry are excellent railway shipping facilities and the use of oil for fuel.

Booker T. Washington, principal of the Tuskegee Normal and Industrial Institute, Tuskegee, Ala., in his annual report, just published, makes an earnest plea for funds to build and equip a trade school building for the proper accommodation of that important department of the work of the institute.

In our trade columns will be found the new price-list for Registers and Ventilators adopted by the manufacturers under date of December 20, 1897. The adoption of this new list will, it is expected, do away with the confusion which has existed among the trade heretofore owing to the existence of two lists for these goods.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Wholesale values have fallen slightly and the tone of the market is a shade weaker. Foreign market news has been tame in the extreme, and alone served to restrain buyers' operations more or less. Some accumulation of stock here, together with the heavy shipments from the Straits during the first half of December, had some influence in the same direction. Consumers have been buying very moderately. Jobbers continue to quote small lots of Straits Pig from stock at 14¾c. per lb.

Copper.—None but ordinary transactions have been reported during the week, but the market has retained very good tone and it is more than possible that the business effected was larger than admitted. In any event wholesale prices have ruled firm, in the face of dull London accounts and some local statistical effort in the direction of creating erroneous impressions regarding European consumption. In a small way business was of very limited proportions, but retailers' prices are firmly held at about 12¼c. per lb. for Lake Ingot and 11¼c. for Ansonia Grade Casting Copper in small lots from store.

Sheet Copper.—A tame demand is reported, business being confined almost entirely to orders for small lots for immediate use. Sheet Copper, in a retail way, is quoted by dealers at about 15c. per lb., basis.

Pig Lead.—In this line dullness has been the most conspicuous feature. Large consumers have purchased nothing to speak of, while the smaller ones and other buyers bought only as immediate wants required. Jobbers' prices for American Pig are rather weaker, ruling at 4⅛c. to 4¼c. per lb. for small lots.

St. Louis advices are as follows : The Pig Lead market has firmed up very materially since our last report. There are plenty of inquiries on the market, and the anxiety of some consumers to place orders has verified the opinion of sellers that nearly all consumers are short of stock. The market closed with prices firm and with the possibility of a substantial advance within the next few days.

Lead Pipe and Sheet.—The usual end-of-the-year dullness influences the market for these materials. Consumers are buying nothing beyond what their immediate requirements call for. Prices are unchanged in the Eastern market, Lead Pipe being quoted at 5¾c. and Sheet Lead at 6¾c. per lb., subject to a discount of 20 per cent.

Spelter.—Competition in this metal has continued keen and the market remains in a rather weak condition, with a spiritless demand from consumers in this quarter. Jobbers' prices continue at 4.45c. to 4½c. per lb. for good Western brands.

St. Louis advices are as follows : Spelter shows some signs of improvement. Some liberal purchases have been made, and efforts have been made to place orders for delivery during the first quarter of 1898 at the current prices, but sellers are slow to accept them.

Antimony.—There has been about the usual jobbing business, and prices are steady. We quote at 7¼c. to 7½c. for Japanese, 7½c. to 7¾c. for Hallett's and 8½c. for Cookson's, in small parcels.

Nickel.—Prices remain steady at about 37c. to 38c. for small quantities.

Tin Plate.—While American Cokes have been selling very fairly, chiefly for delivery between March and June, the amount of business in this line has hardly reached last week's volume. The prices at which the orders were booked were invariably low, and the market shows little improvement in tone. In other varieties of Plates, business has been exceedingly tame. Nevertheless the mills are all well occupied and there is little or no actual pressure of offerings, while stocks are quite light. The retail trade, as is usual at the close of the year, has lapsed into a condition of extreme dullness, with no features of interest. Jobbers' prices unchanged, moderate sized lots of American Plates for spot delivery at New York, Philadelphia or Baltimore being about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3 60 ; do , 100 lbs., $3.40 to $3.50 ; do., 95 lbs., $3 35 to $3.45 ; do., 90 lbs., $3.30 to $3.40 ; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75 ; Allaway Grade, IC, 14 x 20, $4.25 ; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are in very limited demand and prices are without quotable change.

Sheet Iron.—Few new orders have been placed during the week and a general shut down of the Eastern mills is expected during the coming week. Inquiries covering good sized lots are being received, which will probably materialize early in the year. The Sheet mills are generally well satisfied with the last few months' business, both as to volume and prices, and the outlook for 1898 is regarded as bright. Jobbers' business in this section is rather quiet at present, but prices remain firm. Small lots from stock sell at about 2.35c. to 2.40c. for No. 27 Common Black Sheets and 75 and 10 and 5 per cent. to 80 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows : The feature of the Sheet market at present is the receipt of heavy inquiries for delivery extending over the greater part of next year. Some of the large buyers are now willing to cover their requirements far ahead if it can be done at present prices. It is doubtful, however, if the manufacturers will sell much in advance at present rates. Small lots from stock are selling at 2.20c. to 2.25c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—Very little business is reported, consumers generally being anxious to avoid taking in any stock until after the first of the year. The market, as a whole, is devoid of any feature worthy of comment. Prices, while nominally unchanged, are inclined to weakness. Dealers in this city and vicinity are paying about the following rates for moderate sized lots delivered here :

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¾c.
Light Brass	per lb. 4¾c.
Lead	per lb. 3½c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10 50
Heavy Cast Scrap, per gross ton	9.25
Stove Plate Scrap, per gross ton	5.25
Burnt Iron, per gross ton	5.00
Tin Plate Scrap, per ton	5.00

CHICAGO REPORT.

Scrap.—Business is very quiet, but much confidence is felt in the future. A heavy demand is expected after the opening of the new year. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$6.75	....
Machinery Cast	6.75	....
Malleable Cast	5.75	....
Stove Plate (free of burnt)	4.75	....
Burnt Iron and Grate Bars	3.75	....
Sheet Iron and Hoops	3.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.50	....
Old Boilers (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas Pipe and Boiler Tubes	5.50	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	9½c.
Copper Bottoms	....	8½c.
Copper Clips	....	9¼c.
Red Brass	....	8 c.
Yellow Brass	....	6¾c.
Light Brass	....	4½c.
Pipe Lead	....	3¼c.
Tea Lead	....	3 c.
Zinc	....	3 c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	1 c.

Anthracite.—The demand continues light and prices are cut. The card on carload lots of 12 tons minimum is as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60

Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8 60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6 50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE IRON MARKET.

The news shaping the course of the markets in the near future is somewhat contradictory. In the West the demand for Finished Iron is quite heavy. There have been quite considerable purchases of Bessemer Pig in the Central West, and the market has strengthened to $9.50 Valley furnaces and $10 Pittsburgh.

For a long time the Southern Pig Iron makers have maintained a strong attitude, and there was practically a deadlock between buyers and sellers, in which the latter seemed to have the more advantageous position, with the statistical sitnation to back them up. During the last week they have suddenly weakened, and the market is about 25c. off.

The Wire trade has continued quite active under the stimulns of the negotiations for consolidation. It is reported that one large Barb Wire concern in the Chicago district, who do not control their own Rod supply, are a party to the deal, while negotiations are pending for another large plant, similarly situated, in the Central West.

It is intimated that the consolidated company will pnrchase what ontside supplies of Steel Billets are required from two of the largest plants in the country under special contracts which exclude as buyers outside consnmers for the Wire trade.

Numerous reports are cnrrent with reference to the Wire consolidation, from the statement that a very serious obstacle defeating the whole scheme has been met to the assertion that it is bound to go through and will make $6,000,000 per annum. Deducting $2,450,000 for 7 per cent. interest on $35,000,000 preferred stock, this, according to the estimate in question, would leave over $3,500,000 for the common stock, which, we are told, is to be the favorite of the insiders. Since some of them have earned 25 and 27 per ceut. on their capital in recent years, it would take a pretty heavy discount from par to tempt them.

Pig Iron.—In the New York market considerable surprise has been created by the sudden weakening in Southern Irons, which had been firmly held for a considerable period. It has seemed all the more inexplicable because the statistical position is generally regarded as very favorable. There is some talk of an early advance of about 15c. on freight rates in Southern Iron. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10 75 to $11. Southern brands, same delivery: No. 1, $10.75 to $11.25; No. 2, $10.25 to $10.75; No. 1 Soft, $10.75 to $11.25; No. 2, $10.50 to $11.

There is a great deal of inquiry for Pig Iron in the Philadelphia market, and some fair sized lots have been taken, but there is a want of uniformity in prices that is rather discouraging. Some holders are decidedly weak kneed and have not maintained qnotations with that firmness which the situation has seemed to warrant. Under this feeling buyers hesitate to pay the usual asking rates, although at 10c. or 15c. less it is believed that a very large amount of business could be entered. Sellers are disposed to meet the demand in a liberal spirit, and while as a rule quoted rates are adhered to, favorable deliveries are granted, say three or four months, at qnoted rates, possibly six months in special cases. For the present sales are chiefly at inside quoted rates, which for seaboard deliveries are as follows, subject to the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.25; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75 to $11.

Only moderate sales of Pig Iron are reported in Chicago by the local producers and Southern sales agents. Shipments in some cases are being delerred, as foundrymen who take inventory at the close of the year want light stocks. Inquiries are somewhat better for both local and Southern Irons, but buyers are evidently feeling the market and are not yet convinced that it is time to place orders. The temper of the trade, however, is shown by the fact that a contract for 5000 tons of Foundry Iron has been offered to producers at a shade under present quotations and refused. The movement of Lake Superior Charcoal continues light, but prices are maintained in this market. We quote for cash as follows:

Lake Superior Charcoal	$12 50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

In the Pittsburgh district the market for Bessemer Pig Iron is quiet but firm. Foundry Irons continue quiet. For first quality we quote, f.o.b. cars Pittsburgh district, as follows: No. 1 Foundry, $10.50 to $10.75; No. 2 Foundry, $10 to $10.25; Bessemer, $10 to $10.15.

THE HARDWARE TRADE.

The near approach of the end of the year brings with it a falling off in the volume of general business, but all classes of trade, including manufacturers and jobbers, find the time fully occupied with current trade and the matters which naturally call for attention at this season in connection with the closing up of the year's operations and the plans for 1898. Holiday amenities and festivities are also naturally making a place for themselves. Travelers are more generally coming home, but many are still in the field finishing up their routes. From some sections the reports of continued trade are exceptionally good and, with the purchasing which has been stimulated under special circumstances in some leading lines, the month of December will make an excellent showing in the aggregate of the year's business. The matter of the negotiations for the consolidation of Wire Rod interests has withdrawn for a time from public interest while the questions of valnation, &c., are being considered; but the market feels to some extent the influence of the project and prices in Wire and closely related goods are firm. Some lines, however, which will certainly be affected by the success of the movement have not as yet responded in the matter of prices. The important conferences with reference to the consolidation of Enameled Ware interests continue and are referred to by those closely identified with them as favorably progressing. An improved tone in the Screw market is noticeable. Prices generally remain without important change, but in some cases, owing to a falling off in the demand and the solicitude of manufacturers to book orders, they are a little softer. The confident tone in regard to next year's business continnes and a hopeful feeling prevails.

Advices from Chicago.—A phenomenal business is reported in Shelf Hardware. The demand for goods is so heavy as to interfere seriously with those who take stock at this time. The entire force of the leading house here has been obliged to work at night for some time, trying to keep up with daily business and also to take inventory. It is expected from present appearances that December will run far ahead of November in volume of business. Reports received from other Western jobbing centers are of the same character. The statement is made that some of the leading houses last week had the banner days in their history for heavy trade. Manufacturers' agents report an excellent business coming from all localities they visit. The condition of affairs in this line is most unusual. Ordinarily at this time travelers are coming home and business is extremely light. Jobbers of Tinware and House Furnishing Goods also report a continued good demand in their line, although business is not qnite so active as in strictly Shelf Hardware. Heavy Hardware jobbers report a somewhat smaller business now than during the early part of the month. A good demand, however, is coming from special branches. The business with contractors and other irregular buyers has been particularly pronounced. Large orders have been received for Jack Screws and other tools used for heavy operations and public works.

Advices from St. Louis.—Holiday dullness now prevails throughout the Hardware trade, and the balance of the year will be largely devoted to inventories. The year just closed is sure to prove a satisfactory one to nearly the entire jobbing trade. The volume of business will show a material increase, and the year gives promise of closing with prices in a condition which can be described as steady to strong.

NOTES ON PRICES.

Wire Nails.—The week under review did not witness any special change in the condition of the market on Wire Nails. The manufacturers are very conservative in the matter of accepting orders for future delivery, and are in most cases limiting them to those which can be executed

during the present month. The demand from the trade has fallen off for some time, which is accounted for by the fact that many of the houses have covered their pressing requirements. The length of time that will be necessarily occupied in negotiations looking to the success of the consolidation of Rod interests also tends to make the buyers less eager to place their orders for Nails. The price continues unchanged.

Advices from Chicago.—Manufacturers have had an active week and are in receipt of a heavy inquiry for future delivery, but with very few exceptions they are not yet taking orders for shipment beyond this month. Jobbers are in receipt of good orders from the country trade, but as yet little or no indication is shown of speculative buying from that quarter. Small lots are quoted at $1.55.

Advices from St. Louis.—The market is dull and prices are somewhat easier. The excitement which permeated the market on account of the possible consummation of the Wire Rod deal has subsided and there is now no apparent effort to load up in anticipation of an early advance. The outlook for an increased trade after the turn of the year is encouraging and January promises to prove a busy month for the manufacturers of Nails. Jobbers report a light demand and quote $1.65 to $1.70, base, for small lots from store.

Cut Nails.—The demand for Cut Nails is sluggish, but is referred to by the mills as satisfactory considering the season. The fact that Cut Nails for certain uses are coming back into favor and displacing Wire Nails, by which they were temporarily superseded, appears to be one of the features of the situation. Prices are without important change.

Advices from Chicago.—No change is noted in Cut Nails, small lots from stock still being sold at $1.45.

Advices from St. Louis.—The market is without change. Jobbers are asking $1.45 to $1.50 for small lots from store.

Barb Wire.—There is comparatively little doing in Barb Wire, largely owing to the indisposition of the manufacturers to accept orders for future delivery. Jobbers quote small lots of Four-Point Galvanized from store at about $2.

Advices from Chicago.—Manufacturers believe that if they were free to take orders as in past seasons they could dispose of their output for the spring in two weeks. They are, however, only selling for immediate delivery. Jobbers quote prices firmly at $1.60 for Painted and $1.90 for Galvanized in small lots from stock.

Advices from St. Louis—Mills report very little inquiry for Barb Wire, and the same reports come from jobbers. Jobbers quote $1.65 for Painted; 30 cents per hundredweight additional for Galvanized.

Smooth Wire.—The market for Smooth Wire has a firm tone, and manufacturers are conservative in the matter of accepting orders except for immediate delivery.

Screws.—The manufacturers of Screws have during the past month or two had several conferences with a view to determining whether or not there may be some concerted action on their part, but thus far it has not been found feasible to reach a definite understanding. The market is, however, regarded as certainly in an improved condition, and has a decidedly better tone. This is indicated by the fact that while the base price on Flat Head Iron Screws has for some time been 90 per cent. discount, P. & F. Corbin, New Britain, Conn., under date December 22, have issued a circular making the base price 87½ and 10 per cent., their quotations by this circular on the different lines being as follows:

	Per cent.
Flat Head Iron	87½ and 10
" " Japanned	85
" " Brass	87½ and 10
" " Bronze Metal	85 and 10
Round and Oval Head Iron	85
" " " " Brass	85
" " " " Bronze Metal	85
Flat Head Iron Screws, Blued	5 per cent. added

Russell & Erwin Mfg. Company, New Britain, Conn., and 43-47 Chambers St., New York, are also issuing a circular December 22, naming the following discounts:

	Per cent.
Flat Head Iron	87½ and 10
Round and Oval Head Iron	85
Flat Head Brass	87½ and 10
Round and Oval Head Brass	85
Flat Head Bronze Metal	85 and 10
Round and Oval Head Bronze Metal	85
Flat Head Japanned	85
Flat Head Iron Screws, Blued	5 per cent. advance on net

There is a general disposition on the part of the manufacturers to adopt a base of 87½ and 10 per cent. discount, and there seems to be an increasing probability that such action will be general. The prices now prevailing are recognized as unprofitable, and in view of the prospect of increased cost for the raw material an additional reason is given for obtaining more for the goods.

Enameled Ware.—The projectors of the Enameled Ware consolidation have arranged for a meeting next week, following a series of conferences which have been held from time to time, when, it is believed, definite steps will be taken looking to an amalgamation of many of the leading Enameled Ware interests, together with an absorption of Tinware production. The large capitalization spoken of is intended to give an opportunity for acquiring a number of the smaller factories, not necessarily assuming that the entire amount will be represented in property at the start. The negotiations have been somewhat delayed, it is believed, by certain interests who are holding off for acceptable terms. There are still those more or less conversant with the situation who question whether it will be found feasible to carry the movement to a successful conclusion. In the meantime, we are advised, buyers are anticipating their wants somewhat in view of the possibility of the consummation of the project.

Registers.—For some time there has been some confusion in the market for Registers and Ventilators, on account of there being two lists. The manufacturers have, however, recently been conferring with reference to this matter and have adopted a new list, which, it is expected, will be the standard one and do away with the confusion which has heretofore existed. We print below the list of Tuttle & Bailey Mfg. Company, 83 Beekman street, New York, from which it will be seen that the manufacturers have not attempted to use a list unduly high, but one that will, it is expected, meet the general approval of the trade. The list bears date December 20. The discounts to which it is subject are given below, terms 60 days net, or a discount of 2 per cent. for cash in ten days. It is stated that no freight allowances will be made and on all orders of less than $10 boxing will be charged at cost:

	Per cent.
Black Japanned Registers, Ventilators, Faces and Borders	40 and 10
White Japanned Registers, Ventilators and Faces	30 and 10
Bronzed Finishes in Imitation of Gold, Silver, Copper or Bronze	40
Nickel Plated	40 and 10
Electroplated in Brass, Bronze or Copper	40

Japanned—Black or White.

Glass.—On Saturday, December 18, the American Glass Company and the glass workers came to an agreement on the question of wages and the scale was signed for the ensuing year. All the factories included in the new association were notified to start their fires within 21 days, as it was agreed that three weeks were to elapse between the signing of the wage scale and the starting of the factories. It is doubtful whether the three-week interval will be strictly observed, as fires have already been started in a number of factories in anticipation of getting work. In fact, the strain was becoming so great that probably the American Glass Company would have given permission to some factories to start up, even if no agreement had been reached. Under the present circumstances new Glass is not expected to be in the market much before February 1. No new prices have yet been announced by the company and jobbers continue to quote 60 per cent. discount on American Glass, but it is stated that the association will issue a price-list January 1 which will advance prices in proportion to the increase in wages recently granted the workers. This means an advance of about 15 per cent over the prices existing before the lockout began. Imported Glass is quoted at 80 and 10 per cent. discount.

White Lead.—There has been comparatively little business in either dry Lead or in Lead in Oil, but buyers show rather more interest in the latter in view of the further considerable rise in cost of Oil. Corroders have made no change in list prices or terms, and jobbers are rather more backward about filling small orders at the 500 pound rate.

Red Lead.—Only ordinary orders have been placed for Red Lead the past week, and the market is without new feature, prices being the same as quoted for a considerable time past.

Linseed Oil.—Owing to further rise in the cost of raw material and indications that the latter will continue high for some time crushers have advanced their prices still further. In retail quantities Raw Oil is quoted at 43c. to 44c. per gallon.

Spirits Turpentine.—Prices have stiffened and the market is very firm at the advance. The demand, however, is moderate at present.

Write

ED. CURREY, 14 W. Nelson St., Springfield, Ohio.

Manufacturers.

Active, progressive American, 41, with 20 years' experience as a local and traveling salesman and sales agent of a corporation in this city, whose business is with stove manufacturers, jobbers and retailers of stoves, hardware, tin and plumbing goods; large acquaintance with buyers East of Chicago and Pittsburgh; thoroughly conversant with modern business methods, management of salesmen, &c., in every way capable of filling responsible position, is open for an engagement here or elsewhere, in which this experience can be utilized; clean record; high credentials Address "A. B. C.," office of *The Metal Worker*, 232-238 William St., New York.

FOR SALE.

Old established Tin and Sheet Iron Business, doing a good trade in Stoves, Ranges, Heaters, etc., also a 2½ story brick factory complete with tools and implements for the manufacturing of Tin and Sheet Iron specialties, to be sold entirely or in part, whichever is desirable. A good opportunity for a live business man.

"KLONDIKE,"

office of *The Metal Worker*, 232-238 William St., N. Y.

WANTED.

A second-hand **8-foot Cornice Brake.**

Address "CORNICE,"

office of *The Metal Worker*, 232-238 William St., New York.

A VALUABLE INVENTION.

The attention of Stove manufacturers is called to the Down Draught, Fuel Saving, Smokeless Stove, especially constructed for burning soft coal, lignite, garbage, etc., saving 50% in cost of fuel over any other stove. Several other valuable principles are embodied in this great invention. We solicit correspondence from manufacturers to negotiate for the manufacturing of the stove.

SCHMIDT & CO.,
Room 610, 114 Nassau St., N. Y

WANTED.

Thoroughly good and practical receipts for White Enamel for Cast Iron Bath Tubs. Address, in confidence,

"BATH TUBS,"

office of *The Metal Worker*, 232-238 William St., New York.

Manufacturers' Agent or Resident Salesman,

To sell on commission in Western and Southern cities ***a very popular and complete line*** of goods that is having a very large sale in the East and is sold by *all* house furnishers.

Address, COMPLETE LINE,
Office of *The Metal Worker*, 232-238 William St., New York.

FOR SALE.

A good clean, well assorted stock of Hardware, with Plumbing and Tin Shop connected and commanding the best trade in town. Competition consists of one other hardware store. Located in Central New York State in a town of about 7500 inhabitants, having the trunk lines of railroad, paved streets, electric lights, electric street cars, water works, good schools, etc. Stock and fixtures will invoice between $7000 and $8000. Annual sales average about $25,000. This is a rare chance for a cash buyer. Address "RARE CHANCE," office of *The Metal Worker*, 232-238 William St., N. Y.

Special Notices.

Stove and Steel Range Manufactory

Located at MUNCIE, IND.,

To be Sold at Public Sale.

The stockholders of the JOSEPH BELL STOVE & RANGE COMPANY have passed an order to sell their plant and equipment and stocks of material and manufactured stock at public sale, on Wednesday, the 5th of January, 1898, on the grounds of the company at MUNCIE, IND.

The property consists of over 6 acres of ground conveniently situated at MUNCIE, IND., on the West Bank of White River, on the line of the Lake Erie & Western Railroad and accessible to the Big Four Road. The buildings thereon are nearly new and of substantial construction. The Molding building, of brick, is 135 by 145 feet There are two cupolas. The Mounting and Storage building, also of brick, is two stories high, 260 by 60 feet. Office building and show room of frame, two stories. All of the best construction and conveniently arranged.

There is a complete Nickel Plating plant. There are tools and appliances for the economical turning out of the best class of work.

There is a large line of patterns which includes cooking and heating stoves and a line of popular Steel Ranges.

A gas well on the premises belonging to the company furnishes an abundant supply of natural gas. These works have been in operation until recently and are in order to resume work at any time.

The entire property, including all stock on hand at day of sale, materials, patterns, tools and equipment and good will, will be sold in one lot. Sale to take place on the grounds of the company, at MUNCIE, IND., on Wednesday, the 5th January, 1898.

The terms will be made accommodating. Persons desiring information will please address the undersigned,

JOSEPH BELL STOVE & RANGE CO.,
Muncie, Ind.

FOR SALE.

PHILLIPS TIN PLATE CO., Inc.,
PHILADELPHIA.

Now's the time to shape your business policy for 1898. What are you going to do about your tinware? Will you raise the standard of your goods, or will you lower it to meet the competition which cheap enameled ironware is waging? Don't decide hastily, and above all remember that there is always a demand for extra quality tinware, thrifty housekeepers preferring it to ironware for many reasons. There are tin plates, too, to be had, which will enable you to make tinware as good as your grandparents used—GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES. You may safely guarantee all articles made from these plates to last longer and give better satisfaction than tinware made from any other plates.

GUMMEY'S ANTI-PINHOLE BRIGHT TIN PLATES are made from Genuine Charcoal Swedish Iron Bars by the good old-fashioned methods employed 50 to 75 years ago in making charcoal tin plates, *insuring absolute freedom from pinholes.* For tinware or roofing they are unequaled.

GUMMEY, McFARLAND & CO., Philadelphia.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

PRICE, 50c. BY MAIL.

Work put up or material furnished.

—THE Irishman has a great power of enjoyment after all. One day he saw a bull attack a man, and he had to hold on to his sides with both hands, the scene was so funny. After a time the animal turned his attention in another direction, and poor Pat, after exploring the heights, came down with a thump on the other side of the fence.

He rubbed his wounds, and as he trudged along, the worse for wear, he said to himself, "Faith, I'm glad I had my laugh when I did, or I wouldn't have had it at all."—*Weekly Telegraph.*

ONE OF HOLMES' HOME-THRUSTS.—Dr. Oliver Wendell Holmes once made an address in his native town to a medical association. The president of the association was a son of the man who had been the druggist of the village when Dr. Holmes had studied medicine there. "It is good to look at this young man," said the genial autocrat, "and trace his father's liniments in his face."—*Chicago News.*

BICYCLE REPAIRING

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, $1 00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I —Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work —Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

BRIDGEPORT, CONN

—"MAMMA, what does 'pro and con' mean?"

"Two things opposed to each other, my child."

"Oh, that's where the words 'progress' and 'Congress' come from, isn't it?"—*Washington Star.*

—KEEN SENSE OF HUMOR.—A man was up before a Judge the other day for stealing coal. The railroad detective said he caught the fellow in a coal car, but the man said that he was only sleeping there, because his wife had locked him out and he had no money to go to a hotel.

"Pretty hard bed, wasn't it?" asked the Judge.

"Oh, no, sir," he answered, "it was soft coal."

And the Judge was so struck with the joke that he let him go.—*Buffalo Enquirer.*

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

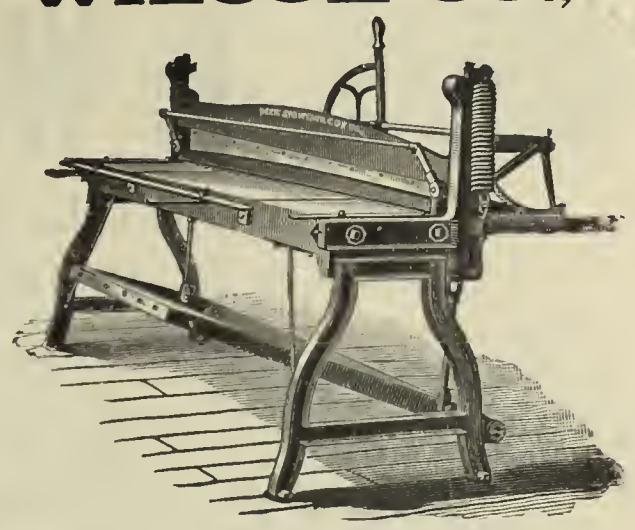
HARE'S FOUR-LEAF CORNICE BRAKE

Hundreds sold and **never a complaint.** Works easily and rapidly. The universal verdict is, **IT IS THE BEST IN THE WORLD.**

96 inches long. Price $250.

Our **Improved Eureka Cornice Brake.** Will bend No. 20 iron.

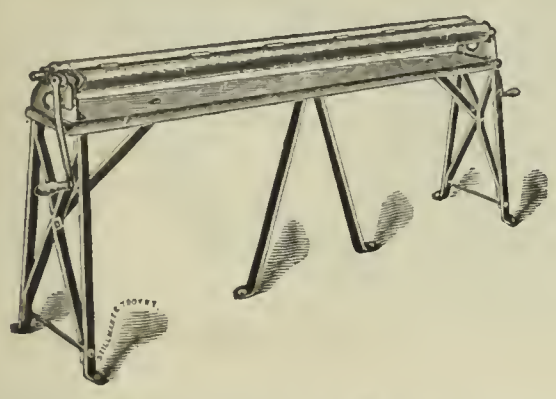
96 inches long. Price $185.



CORNICE MAKERS' SQUARING SHEARS,

With Lever Arc, Automatic Gauge. Will cut No. 22. iron. **97 inches long. Price $275.**

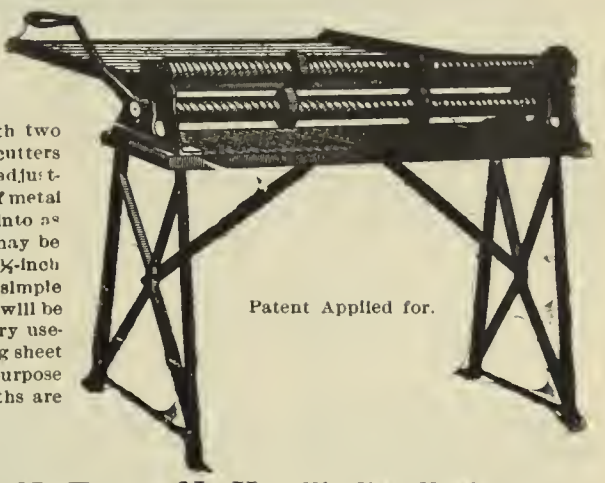
The CAPITAL GUTTER FORMER



is adapted to form gutter from 3 inches to 7 inches inclusive. The forming of the bead and gutter is practically a continuous operation. Capacity 600 feet perfectly formed gutter per hour with two ordinary men or boys.

The Rotary Slitting Shears

are provided with two or more pair of cutters which are easily adjusted to cut a sheet of metal 30 inches wide into as many strips as may be desired, from ¼-inch and wider; is simple and durable, and will be found to be a very useful tool for slitting sheet metal for any purpose where long lengths are required.



Patent Applied for.

E. W. BLISS CO., 16 Adams St., Brooklyn, N. Y.

OWNERS OF THE STILES AND PARKER PRESS CO.

NO. 153B "BLISS" PARALLEL SHAFT BEADING AND FLANGING MACHINE.

In the ordinary type of Beading and Flanging Machine, the shafts open apart by a hinge at the end. Unless the shafts and rolls are adjusted with the greatest nicety, satisfactory work cannot be secured. This is due to the fact that, when the shafts are thrown apart to put on or remove the work, they are farther apart at the outer point of contact than at the inner This also makes it impracticable to shift the position of the rolls to suit cans of various lengths, unless they are of the exact diameter required to bring the shafts parallel. If not so made, when the rolls are brought closer together or moved farther apart, the parallelism of the shafts is destroyed and the rolls do not fit.

To overcome this difficulty, we have designed the machine shown in the accompanying illustration. In it the upper shaft bearings have a hinge parallel to the shafts. When the two shafts are separated their parallelism is not disturbed. Thus the outer rolls may be placed at any point on the lower shaft, making the machine available for a wide range of work. The shafts are brought into working position by the hand wheel shown instead of by the usual foot treadle.
